PREFACE

THE Lincoln Library of Essential Information has been prepared with two controlling ideas in view. One has been to embody the greatest amount of useful information for the average reader that could reasonably be placed in one work. The other aim has been to select, condense, arrange, and verify the material with a thoroughness and accuracy greater than that attained in any comparable work. The accomplishment of these aims ensures the production of a work in a class by itself.

NAME. The title of the work, The Lincoln Library of Essential Information, expresses the fact that it contains the essentials of a library of informational material. It signifies also that this information has been adapted to the needs of those who, following in the steps of Abraham Lincoln, will welcome every means of self-education.

SCOPE. This work is more than a source of information. It presents a range of knowledge greater than even experienced users of books would imagine possible. It offers a vast array of practical information on subjects that are fundamental. These include Geography, Economics, History, Government, Education, English, Literature, Fine Arts, Mathematics, Science, and Biography. The essentials of each are set forth clearly and completely. The field of human achievement is covered in Biography, the largest Department, which contains profiles of more than 4,000 of the world's noted men and women. Much information not directly referrable to the foregoing divisions has been grouped in the Miscellany. Review questions and bibliographies are given at the end of each section. Some idea of the scope of the encyclopedia lies in the fact that it covers more than 26,000 entries in the comprehensive Index.

METHOD AND PLAN. The plan of The Lincoln Library is in no sense an experiment, but is a development based on many decades of experience. The needs and desires of many million buyers and users of books containing useful information have been systematically studied. This study has shown that, for practically all readers, the most satisfactory source of general information is a comprehensive single reference work.

The careful planning by means of which this entire library has been published in two volumes obviates several obstacles to the average reader's use of the best reference works. Practically all such works are in many volumes, and the price is prohibitive to the great majority. There is also the matter of convenience.

Our study has shown also that the alphabetical arrangement followed in most encyclopedias is not suitable for a single work designed to contain the fullest possible information. When unrelated subjects are ranked next to each other in an A-to-Z arrangement, a large amount of information is unavoidably repeated.

It appeared desirable, also, to avoid the methods of the formal treatise, which often includes relatively unimportant matter. Elaborate refinements, which are seen in specialized textbooks, have been excluded. Without being a mere fact book, this work contains a larger number of carefully selected facts than similar works. It is not a dictionary, though it makes use of dictionary features wherever such treatment is of advantage. In short, adaptations of many widely used and tested methods have been worked out—in some instances, entirely new arrangements have been devised.

ACCURACY. In conformity with the policy of striving for the highest standards, care has been taken that the material should be based on primary sources and be as consistently accurate as possible. Many scholars and specialists have been enlisted, and all material has been subjected to intensive verification.

UP-TO-DATENESS. In no other age have advances in knowledge and in inventions so quickly rendered obsolete much that was accurate at the time it was published.

Whole new fields have been added to knowledge within the recent past. In this work, it has been a matter of care that such subjects should be adequately treated, and that the most recent positive contributions to knowledge should be duly recorded.

Social and political changes have made the 20th century a period of flux. National boundaries and governmental forms ebb and flow, making many older books of reference obsolete. The Lincoln Library meets this problem through its policy of thorough revision with each new printing.

For each new edition, the contents are systematically tested and revised. Not only facts, but also the perspective of the work, are kept abreast of a world constantly changing in aspect, interests, and viewpoint. On the whole, this work generally will be found to surpass larger encyclopedias in up-to-dateness, just as it goes beyond other compact works in completeness.

In the case of statistics regarding populations and other factors that vary continually, the most recent authentic figures are given rather than later estimates. It seems more desirable to present authoritative information rather than that which is recent but which lacks the essential of all statements of alleged facts—reliability.

Mass of Contents. By using every available centimeter of space, the mass of contents in The Lincoln Library had been made to exceed that of many more expensive encyclopedias of six to thirty volumes. This disparity in mass of contents, however, is only part of the difference between The Lincoln Library and the average multi-volume encyclopedia. Not only does the Lincoln excel in the amount of material presented, but the material itself is in a much more concise form. Consequently, this work contains from twice to many times as much information as the average work of many volumes.

By reason of these facts, The Lincoln Library holds a unique place in the world of books. The elaborate work of many volumes has had a recognized place since the 18th century, when Diderot and his colleagues in France produced, by twenty-one years of labor, their monumental *Encyclopédie*. The compact reference work of 800 to 1000 pages also has a well-established place. The Lincoln Library occupies a position intermediate between these types. It combines the advantages of lower cost and greater convenience in consultation with a completeness in essential information that closely approaches that of larger works.

Introductions. Preceding the treatment of each major subject, there is a useful preface giving the scope of the subject, its importance, and its function. In addition, many subdivisions, for example, Mythological Allusions, have instructive introductory sections and tables. These introductions give the user a clear idea of the value of the subject itself and lead to accurate knowledge of branches with which he has not previously been acquainted.

Dictionaries. In practically every department there is at least one dictionary, or group of selected topics in alphabetical order. These dictionaries effectively supplement the other material in the department. Following the discussions on government, there is a Dictionary of Political Terms and Institutions. The Department of Science is well provided with dictionaries, including alphabetically arranged sections on plants, animals, minerals, chemical terms, and added groups of subjects of importance.

Tabulations. As a base of condensed information, there is no superior to a well-constructed tabulation. This work has used carefully planned tables to an extent not found in other works, and has thus been able to display condensed information in readily accessible form. There are about 200 of these tables. Many, if expanded into descriptive text, would each provide material for a substantial volume.

Illustrations. Each department is introduced by appropriate full-page illustrations in color. The longer departments contain many pages of pictures, in color and black and white, covering thousands of subjects. Following the concept of presenting essential information, it has not been the aim to provide a heavily illustrated reference work. Rather, the intent is to provide a limited but useful array of photographs, maps, selected works of art, line drawings, graphs, and diagrams in locations where they will provide effective help and guidance. An example of such special selection and interest is the color sequence illustrating DNA, RNA, and the Cell in the section on Physiology.

Maps. Recently prepared maps of the world, of the continents, and particularly of the United States and Canada precede the extensive descriptive material in the Department of Geography.

Bibliographies. The user who may desire to extend his knowledge of some special subject will find, at the end of each department, a classified list of authoritative works. From these lists, he will be able to select books in which he may pursue a topic at greater length.

Review Questions. At the end of each department will be found selected questions covering essentials of the topics treated. In all, there are more than 10,000 such questions, the answers to which, in themselves, constitute the foundations of a liberal education.

Index. The Master Index enables the reader to obtain information with speed and precision. While necessarily of extensive size because of the broad contents of the work, this index is simple and compact so that real ease will be found in its use.

CONTENTS

ATLAS

The World—North America—Canada—United States—Mexico—Central America—West Indies—South America—Western and Central Europe—British Isles—France—Germany—Scandinavia and Finland—Italy—Spain and Portugal—Balkan States—USSR—Asia—Southwest Asia—Southern Asia—East Asia—Southeast Asia—Indochinese and Malay Peninsulas—Australia and New Zealand—Pacific Ocean—Africa—Antarctica 1–48

I. GEOGRAPHY

Value of Geography—Geographical Discovery—General Facts about the Earth—North America—The United States—Growth of the United States—Largest Cities of the United States—Dictionary of American Geography—Canada—Mexico—Central America—West Indies—South America—Europe—Asia—Africa—Australia—Antarctica—World Statistics—Mountains and Volcanoes—Principal Islands—Important Rivers—Noted Waterfalls—World Travel Distances—Meanings of Place Names 49–250

II. ECONOMICS

Commerce—Commercial Raw Materials—Communication—Transportation—Labor Relations—Marketing—Advertising—Salesmanship—Insurance—Business Cycles—Investments—Money and Banking—Dictionary of Business, Banking, and Legal Terms—Agriculture—Horticulture—Forestry—Irrigation—Animal Industry—Fisheries—Mining and Mineral Production—Inventions—Engineering and Building—Manufacturing—Lumbering—Technology 251–438

III. HISTORY

American History: Exploration, Colonization, Revolutionary War, Territorial Growth of the United States, Civil War, Industrial Era, World Power, Historical Statistics, American Flags, Political Parties, Presidents, Dictionary of American History—Commonwealth of Nations History: England, Scotland, Wales, Canada, India, Australia, New Zealand—Latin American History—World History, Countries Ancient and Modern: Abyssinia (Ethiopia), Alsace-Lorraine, Austria, Babylonia, China, Czechoslovakia, Egypt, Finland, France, Germany, Greece, Holy Roman Empire, Italy, Japan, Norway, Persia (Iran), Poland, Rome, Russia, Spain, Sweden, Switzerland, Turkey, Yugoslavia—Ancient Cities—Peoples of the World—World War I—World War II—Dictionary of World History—Table of Periods, Events, and Movements of World History 439–726

IV. GOVERNMENT AND POLITICS

United States of America—Articles of Confederation—Constitution—Federal Government: The Congress, The President, The Supreme Court, Federal Agencies and Commissions—American State Government—Local Government—Commission Form of Government—Suffrage Requirements in All States—World Governments: Asian and African countries—Belgium—British Commonwealth—Central American States—China—France—Germany—Greece—Italy—Japan—Mexico—Netherlands—Norway—Poland—South American Countries—Soviet Russia—Spain—Switzerland—Dictionary of Political Terms and Institutions . . 727–840

V. EDUCATION

History of Education—Educational Institutions—Ancient Education—Medieval and Modern Education—Educational Reformers—Science of Education—Experimental Psychology—Intelligence Tests—School Surveys—Curriculum Studies—Job Analysis—School Systems of Various Countries—Education in the United States—Early Childhood Education—Elementary School—Junior High School—High School—Junior College—Universities—University Extension—Professional Schools—Vocational Education—Religious Education—Parent-Teacher Associations—Textbooks—Radio and Television in Education—Early Childhood Education 841–924

VI. ENGLISH LANGUAGE

The English Language—Good Usage—Word Building—Derivation of English Words from the Latin—Correct Spelling—Correct Pronunciation—Sentence Building—Prepositions—Conjunctions—Capital Letters—Punctuation—Language and Linguistics—Linguistic Theory—Writing and Speaking—Radio and Television Speaking—Forms of Literary Composition—Letter Writing—The Family Library—Synonyms and Antonyms—Foreign Words and Phrases—Abbreviations 925–1100

VII. LITERATURE

Modern Literature in the Western Nations—American Literature—English Literature: English, Canadian, and Australian Writers—Irish Literature—Romance Literatures: French, Italian, Spanish, Latin American—Germanic Literatures: German, Dutch, Scandinavian—Slavonic Literatures: Russian, Polish, Czech—Ancient and Oriental Literatures: Chinese, Japanese, Assyro-Babylonian, Hebrew, Arabic, Persian, Indian, Greek, Latin—Literary Plots, Characters, and Allusions—Mythological Persons, Places, and Stories 1101–1252

VIII. FINE ARTS

Environmental Design—Architecture—Interior Design—Crafts—Drawings—Painting—Print-making—Sculpture—Art Terms and Subjects—Photography—Music—Dictionary of Musical Terms—Leading Operas—Dance 1253–1476

IX. MATHEMATICS

History of Mathematics—Arithmetic—Mensuration—Plane Figures and Solids—Formulas—Graphs—Practical Problems—Weights and Measures—Metric System—Tables—Algebra—Logarithms—Geometry—Trigonometry—Calculus 1477–1540

X. SCIENCE

Value of Science—Methods of Science—Physical Geography: Land Forms, Continents, Islands, Mountains, Oceans, Lakes, Glaciers, Rivers, Volcanoes, Earthquakes, Climate, Wind—Meteorology, Oceanography—Geology: Kinds of Rock; Geological History of North America; Paleontology—Mineralogy: Minerals, Gems, and Precious Stones—Astronomy: History, Value; Earth, Sun, Moon, Planets, Stars, Comets, Nebulae, Telescope—Physics: Mechanics, Newton's Laws, Sound, Heat, Light, Electricity, Radioactivity, Atomic Energy, Magnetism—Chemistry: Principles; Chemical Substances, Metallic Alloys—Biology: History; Organic Evolution, Mendel's Law; Microbiology, the Cell—Anatomy, Physiology: Structure of the Human Body, Muscles, Circulatory System, Respiratory Organs, Nervous System, the Brain—Zoology: Classification of Animals, Dictionary of Animals—Botany: Classification of Plants, Dictionary of Plants—Ecology—Psychology 1541–1830

XI. BIOGRAPHY

Noted Men and Women of the Past and the Present: Statesmen—Rulers—Religious Leaders—Soldiers—Philosophers—Scientists—Authors—Orators—Jurists—Lawyers—Physicians—Educators—Discoverers—Explorers—Inventors—Financiers—Merchants—Manufacturers—Engineers—Architects—Painters—Sculptors—Composers—Musicians—Nobel Prize Winners, and Others 1831–2164

XII. MISCELLANY

Parliamentary Law—Orders, Societies, and Organizations—California Missions—Heroic Deeds—Sobriquets and Nicknames—Festivals and Holidays—Statistics of Religious Bodies—Psychiatry—Drawing and Design—Furniture—Games and Sports—Civilization: Problems and Progress—Space Exploration—General Miscellany 2165–2258

INDEX

How to Use—Illustrations—Master Index 2259

THE BUILDERS

This unique and comprehensive reference series owes its origin to the constructive foresight and untiring energy of Mr. M. J. Kinsella, founder and first president of The Frontier Press Company. Initially developed under his vigorous and able management, with the aid of a corps of workers who shared his vision, this organization has grown until it now stands in the foremost rank of American educational publishing houses. Beginning in 1908, with the publication of *The Standard Dictionary of Facts*, a compact digest of general information, this firm has concentrated during the following years on the presentation of organized knowledge brought together in a single reference work. The founder's aim of making a maximum quantity of useful knowledge readily available "under one roof," as a reviewer expressed it, led to the publication and later the continued improvement of the compact encyclopedia known everywhere as *The Lincoln Library*.

A Work for Desk Reference. Mr. Kinsella had completed a classical course at the Buffalo State Normal School and, in 1900, had received an A.B. degree from Cornell University. His experience as student, teacher, and businessman had impressed him with the need for having reference works on a desk at one's finger tips, not somewhere in a closet or on a shelf behind glass doors. While recognizing the importance of numerous volumes for leisurely reading and of specialized textbooks for formal study, he noted that busy people frequently have occasion to look for specific facts concerning an unlimited variety of subjects. To make it possible for them to obtain this information quickly, he conceived of a reference work in a few volumes that should be developed according to certain ideas derived from his personal experience and also from consultation with others. Briefly summarized, these ideas were as follows: first, the typical "handy" reference work, usually containing 800 to 1000 pages, should be greatly expanded if it was to fulfill its mission; second, in its enlarged form, such a work could be made readable and interesting as well as informative and could be particularly helpful to the large percentage of the general public who could not afford to purchase the multi-volume A-to-Z encyclopedias; third, because of its convenience for quick reference, it could usefully supplement the larger reference works and other books found in well-stocked private libraries; and fourth, if presented in an organized way, the content of such a work could provide the means for a thorough review of anyone's knowledge or for an effective program of self-education.

According to Ward Lamon, one of his early biographers, Lincoln's formal education did not amount to more than one year of schooling. Not only his professional studies in law and surveying but also literature, geometry and other elementary subjects were mastered by a process of self-instruction. While profiting from the historical facts concerning Lincoln's study, the Builders recognized the present and future needs throughout America that are created by an ever-expanding program of adult education. Consequently, *The Lincoln Library* series, because of the organization of knowledge, became not only enlarged "fact books" but also an educational medium noted for effectiveness as a means of self-education.

CONTRIBUTORS AND EDITORS

The preliminary pages contain a list of men and women, occupying various positions of importance in the United States, Canada, and Australia, who have collaborated extensively in building The Lincoln Library series. After each name in this list is given the person's scholastic degree. Next is indicated the present or former position occupied by each collaborator, with a statement of the specific task performed.

In case a department, section, or article was prepared *in toto* by one of these collaborators, it is stated that he *contributed* it.

In case a section, prepared by the office editorial staff or by an outside contributor, was edited, revised, expanded, or approved by one of these collaborators, the exact service performed is specifically defined.

REVISIONS

One of the most serious problems facing the publishers of modern reference books is that of keeping abreast of the times. The policy adopted in that regard for The Lincoln Library series is in keeping with the high standards established when it was founded. At each new printing, those portions which are affected by the passage of events are thoroughly revised.

In some cases, the original contributor of a section or Department has made the necessary revisions. In other cases, the services of different outside editors have been secured, the list of editors being revised accordingly. A large part of this revision work, however, has necessarily been carried out by the editorial staff, which is engaged continually in surveying the progress of the world in order to select and report the most significant developments. In all such revisions, the original character of the articles has been left unaltered except insofar as necessary in order to present each topic in the perspective of the present time.

The policy of thorough revision at each new printing, inaugurated by M. J. Kinsella, has been carried on through a chain of leadership extending from his death in 1928 to the present. He was succeeded as president of The Frontier Press Company by his brother, Burt S. Kinsella, who served for nearly twenty years. Following his retirement the presidency was held from 1948 to 1958 by H. C. Goff, who was succeeded by Verne E. Seibert. On the latter's retirement in 1966, the reins were taken by his son William H. Seibert. Each of these men had worked closely with his predecessor, so that unbroken continuity of policy was assured. Even more important was the cumulative development of certain features of the encyclopedia. Care in the selection of contributors, vigilance on the part of the editorial staff, and the maintenance of high standards of accuracy have given The Lincoln Library a position of leadership in its field that has continued without serious challenge.

EDITORS AND CONTRIBUTORS

PARTIAL LIST OF CONTRIBUTORS

ABBOTT, FRANK FROST, Ph. D.
Late Kennedy Professor of Latin Language and Literature, Princeton University. Author: *A Short History of Rome.*
Contributed Roman History and Literature.

ALEXANDER, WILLIAM P., Ph. D.
Late Director of Extension Work, Buffalo Society of Natural Sciences; formerly, Department of Entomology, Cornell University.
Contributed articles on Ant and Honeybee.

ATWOOD, WALLACE WALTER, Ph. D.
Late President, and Professor of Physical and Regional Geography, Clark University, Worcester, Mass.
Revised and expanded Physical Geography.

BARRETT, JAMES M., B. S., M. S., Ph. D.
Assistant Professor of Zoology, Marquette University.
Contributed the material on The Cell, DNA, and RNA for the 28th edition.

BARROWS, DAVID PRESCOTT, Ph. D., LL. D.
Former President, and Professor of Political Science, University of California.
Contributed Government and Politics.

BARTELS, ROBERT, B. S., M. B. A., Ph. D.
Professor of Business Organization, The Ohio State University. Author: *Development of Marketing Thought.*
Contributed Marketing, 25th edition; and Salesmanship and Advertising, 26th edition; reviewed Economics, 34th edition.

BELL, ROGER A., B. Sc., Ph. D.
Assistant Professor of Astronomy, University of Maryland, College Park, Md.
Revised Astronomy, 28th and 30th editions.

BICKELHAUPT, DAVID L., B. S., M. S., Ph. D.
Professor of Insurance, The Ohio State University.
Revised Insurance for the 34th edition.

BICKLEY, JOHN S., B. A., M. B. A., Ph. D.
Professor of Business Organization, University of Texas.
Revised Insurance for the 24th edition.

BOTHNE, GISLE C., M. A.
Head of the Department of Scandinavian Languages, University of Minnesota.
Contributed articles on Norwegian, Danish, Swedish, and Icelandic Literatures; also Norwegian, Danish, and Swedish History.

BOURNE, HENRY ELDRIDGE, A. B., B. D., L. H. D.
Late Professor of History, Graduate School of Western Reserve University. Author: *Mediæval and Modern History.*
Revised the article on French History.

BROCK, REGINALD WALTER, M. A., LL. D., F. G. S., F. R. S. C.
Dean of the Faculty of Applied Science and Head of the Department of Geology and Geography, University of British Columbia.
Revised the section on Canadian Geography.

BRUMFIEL, CHARLES F., B. S., M. A., Ph. D.
Professor of Mathematics, University of Michigan.
Revised Arithmetic for the 28th edition.

BURNS, ROBERT E., A. B., C. P. A.
Member Association for Computing Machinery.
Contributed article on Computers for 30th edition.

CAMERON, HELEN ARNOLD, B. A., M. B. A., Ph. D.
Associate Professor of Economics, The Ohio State University.
Revised Business Cycles for the 34th edition.

CASE, ERMINE COWLES, PH. D.
Curator of the Paleontological Collection, University of Michigan.
Contributed Geology and Paleontology.

CHURCHILL, GEORGE MORTON, PH. D.
Late Professor of English History, The George Washington University.
Contributed the article on World War II and revised departments of History and Government for 11th and several later editions.

COHEN, PAUL P., B. A., LL. B.
Formerly Lecturer in Government, State University of New York at Buffalo.
Contributed Business, Banking, and Legal Terms.

COLE, DAVID W., M. B. A., D. B. A.
Associate Professor of Finance, The Ohio State University.
Revised Investments for the 34th edition.

CONANT, HOWARD S., B. S., M. S., Ed. D.
Chairman, Department of Art Education; Head, Division of Creative Arts, New York University.
Contributed articles on Crafts, Drawing, Painting, and Sculpture.

CRAIG, PAUL G., B. A., M. A., Ph. D.
Assistant Professor of Economics, The Ohio State University.
Revised Business Cycles for the 24th edition.

CURRAN, TERENCE, B. A., M. L. S.
Reference Librarian, Victoria Public Library, Victoria, B.C.,; Member: *The American Name Society.*
Reviewed and revised Meanings of Place Names for the 28th edition.

DEWING, HENRY BRONSON, Ph. D.
President of Athens College, Athens, Greece.
Contributed Greek History and Literature.

DORFMAN, WILLIAM, B. S., M. A., Ph. D.
Counseling Psychologist, United States Army Medical Service Corps.
Revised and expanded the article on Psychology for the 34th edition.

FARMA, WILLIAM J., Ph. D.
New York University, Department of Education.
Reviewed and revised the Department of English for the 17th edition.

FINEGAN, THOMAS EDWARD, M. A., Ph. D., LL. D., Litt. D.
Superintendent of Education for State of Pennsylvania.
Reviewed, revised, and approved sections on Introduction to the English Language, Word Building, and Forms of Literary Composition.

FRANKLIN, EDWARD CURTIS, B. S., M. S., Ph. D.
Late Professor of Organic Chemistry, Stanford University.
Reviewed Chemistry for the first edition.

FREER, JAMES J., Ed. D.
Associate Professor, Department of Psychology, University of Detroit, Michigan.
Revised Psychology for the 28th edition.

FRUTKIN, ARNOLD W., B. A.
Assistant Administrator for International Affairs, National Aeronautics and Space Administration; author: *International Cooperation in Space.*
Contributed Section on Aeronautics and Space Exploration for the 30th edition.

FRYER, CHARLES EDMUND, M. A., Ph. D.
Professor of History, McGill University, Montreal, Canada.
Contributed the articles on the History of Canada and the British Commonwealth of Nations.

GAUSS, CHRISTIAN, A. M., Litt. D.
Late Dean of the College and Dean of the Alumni, Princeton University.
Contributed the Introduction to Literature and the table showing the Development of Modern Literature.

GIBBONS, OLIPHANT, A. B.
Supervisor of English, Secondary Schools, Buffalo, N.Y.
Reviewed, revised, and expanded the section on Synonyms and Antonyms.

GLENN, BURVIL HOLMES, B. S., M. A., Ph. D.
Professor of Education, State University of New York at Buffalo.
Revised the Department of Education for the 24th and subsequent editions.

GORDON, ELIZABETH M., B. S. in Ed.
Deputy Supervisor, Boston Public Library.
Revised Suggestions for the Family Library and The Children's Library for the 25th edition.

GRIFFITH, FRED R., Jr., A. B., M. A., Ph. D.
Formerly Head of the Department of Physiology, School of Medicine, State University of New York at Buffalo.
Revised Physiology for the 22d edition.

HALL, CALVIN SPRINGER, A. B., Ph. D.
Formerly Chairman, Division of Psychology, Western Reserve University.
Contributed the section on Psychology for the 17th edition.

HARPER, EDWARD O., A. B., M. D.
Assistant Dean and Associate Professor of Psychiatry, School of Medicine, Western Reserve University; Associate Physician, University Hospitals, Cleveland, Ohio.
Contributed the section on Psychiatry and revised it for the 25th and 32nd editions.

HAWORTH, PAUL LELAND, Ph. D.
Professor of History, Butler College; formerly Lecturer in History, Columbia University and Bryn Mawr College.
Contributed the section on World War I.

HILLS, E. JUSTIN, A. B., M. A., Ph. D.
Chairman, Mathematics and Science Dept., Cape Cod Community College.
Revised the Algebra, Geometry, and Trigonometry sections for the 28th edition.

HOEING, CHARLES, Ph. D.
Trevor Professor of Latin, and Dean of Graduate Studies, University of Rochester.
Reviewed and revised the section on English Words Derived from the Latin.

HOWARD, JOHN TASKER, A. M.
Late Musician, Composer, Author.
Revised Music for the 17th edition.

HUEBNER, SOLOMON S., B. S., M. S., Ph. D.
Professor of Insurance and Commerce, Wharton School of Finance and Commerce, University of Pennsylvania.
Contributed the section on Insurance.

HUNKER, HENRY L., B. A., M. A., Ph. D.
Professor of Geography, The Ohio State University.
Revised Commerce, Transportation, and Power for the 24th, 26th, and 34th editions.

JEWELL, WILLIAM McINTYRE, A. B.
Professor of Fine Arts, Boston University.
Revised Architecture for the 25th edition.

JOHNSON, EMORY RICHARD, B. L., M. L., Ph. D. (Sc. D.)
Late Professor of Transportation and Commerce and Dean of the Wharton School of Finance and Commerce, University of Pennsylvania.
Contributed the section on Transportation.

JOHNSON, ROSSITER, A. M., (Hon. Ph. D., LL. D.)
Author: *A History of the French War Ending in the Conquest of Canada.* Editor: *The Universal Cyclopædia.*
Contributed the original section on Meanings of Place Names.

JORDAN, DAVID FRANCIS, B. C. S.
Late of the Department of Finance, New York University.
Contributed the original sections on Investments and Money and Banking.

JUDD, CHARLES HUBBARD, Ph. D., LL. D.
Late Professor and Director of the School of Education; also Chairman of the Department of Psychology, University of Chicago.
Contributed the entire Department of Education for the first edition.

KARL, LINDA
Adjunct Professor of Art, Division of Creative Arts, New York University.
Contributed the article on Print-Making.

KIMBALL, STOCKTON, B. S., M. D.
Late Dean of the School of Medicine, State University of New York at Buffalo.
Reviewed the sections on Physiology and Anatomy for the 22d edition.

KLAIBER, G. STANLEY, B. A., M. A., Ph. D.
Associate Professor of Physics, State University of New York at Buffalo.

Revised section on Physics for the 25th through 28th editions.

KLUCKHOHN, LUCY WALES, A. B.
Writer on Anthropology. Editor: 1966 edition of Clark Wissler's *Indians of the United States.*

Contributed article on Indians of North America for the 30th edition.

KLUCKHOHN, RICHARD, A. B., M. A., Ph. D.
Associate Professor of Anthropology, San Fernando State College.

Contributed section on Peoples of the World.

LANCASTER, JOHN HERROLD, B. S., M. A., B. S. (L. S.), Ph. D.
Head Librarian, Baldwin-Wallace College, Berea, Ohio.

Revised the Bibliographies for the 25th and subsequent editions.

LEARY, DANIEL BELL, M. A., Ph. D.
Late Professor of Psychology and instructor in Russian, State University of New York at Buffalo.

Reviewed and revised Russian Literature and Russian History.

LEIGHTON, FREDERICK, B. S.
Late Superintendent of Schools, Oswego, New York. Author: *Students' Hand Book of Parliamentary Law.*

Contributed the section on Parliamentary Law for the first edition.

LEVIN, GILBERT V., A. B., Ph. D.
Director, Life Systems Division of Hazelton Laboratories.

Contributed article on Water Supply and Pollution Control for the 30th edition.

LEWIS, CALVIN LESLIE, A. B., A. M.
Professor of Rhetoric and Oratory, Hamilton College.

Reviewed and revised the section on Speaking and Writing in the first edition.

LINK, JOSEPH F., Jr., Ph. B., B. S., A. M., D. Ed.
Associate Professor of Economics and Head, Dept. of Commerce, Xavier University, Cincinnati, Ohio.

Contributed to revision of Department of Economics for the 18th and 30th editions.

LOPEZ, MANUEL LEON, A. B., A. M.
Department of Romance Languages, University of Oregon.

Reviewed and revised Spanish Literature and Spanish History; also Latin American Literature.

McCABE, LOUIS C., B. S., M. S., Ph. D.
President, Resources Research, Inc.; consultant to industry and government on air pollution.

Contributed article on air pollution for the 30th edition.

MacCRACKEN, HENRY NOBLE, Ph. D., LL. D., L. H. D.
Former President of Vassar College.

Reviewed, with constructive suggestions, the original manuscript on Sentence Building, Prepositions, and Conjunctions.

McCREA, ROSWELL CHENEY, Ph. D.
Late Dean of the School of Business, and executive officer of the Department of Economics, Columbia University.

Revised the sections on Inventions.

McGRATH, RUTH E., B. S., Ed. M., Ed. D.
Associate Professor of Education, Director of Laboratory School, State University of New York at Buffalo.

Contributed Early Childhood Education for the 25th and 28th editions.

MacIVER, ROBERT MORRISON, B. A., M. A., D. Phil., F. R. S. C.
Professor of Political Philosophy, Columbia University.

Contributed the Introduction to Economics and Useful Arts.

McLEOD, ALAN L., B. A., M. A., Dip. Ed., B. Ed., Ph. D.
Associate Professor of Speech and English, State University of New York at Fredonia.

Contributed article on Australian Literature and revised other articles on Australia for the 25th edition.

MADDEN, DOROTHY G., A. B., M. A., Ph. D.
Chairman, Department of Dance, University of Maryland.

Contributed the article on Dance.

MALLORY, V. STANDISH
Professor, Dept. of Geology, University of Washington.

Revised Geology for the 28th edition.

MATTERN, J. ARTHUR, B. S., M. S., Ph. D.
Associate Professor of Chemistry, State University of New York at Buffalo.

Reviewed and revised the section on Chemistry for 25th and subsequent editions.

MILJUS, ROBERT C., B. A., M. A., Ph. D.
Associate Professor of Management Science, The Ohio State University.

Revised Labor Relations for the 34th edition.

MILLER, GLENN W., B. Ed., A. M., Ph. D.
Professor of Economics, The Ohio State University.

Revised the section on Labor Relations for the 24th and 25th editions.

MOODIE, ROY LEE, Ph. D.
Professor of Paleodontology, College of Dentistry, University of Southern California. Author: *Paleopathology.*

Reviewed, revised, and materially extended the section devoted to Mineralogy.

MORGAN, BAYARD QUINCY, Ph. D.
Chairman of German Department, Stanford University.

Revised German Literature and History.

MORGENSTERN, JULIAN, Ph. D.
President Emeritus of The Hebrew Union College, Cincinnati, Ohio.

Contributed the article on Jewish History; also the articles on Hebrew, Syriac, Ethiopic, Arabic and Assyro-Babylonian Literatures.

MOULTON, FOREST RAY, Ph. D., Sc. D.
Formerly Professor of Astronomy, University of Chicago.

Contributed the original section on Astronomy.

NEEDHAM, JAMES GEORGE, Litt. D., Ph. D.
Former Professor of Entomology and Limnology, Cornell University. Author: *Outdoor Studies; General Biology.*

Revised and expanded the section on Zoology.

O'NEIL, WAYNE A., B.A., M.A., Ph.D.
Professor of Education and Linguistics, Harvard University.

Contributed Linguistics, 32d edition.

PARK, CLYDE W., A. M.
Formerly Professor and head of Department of English, College of Engineering, University of Cincinnati.

Supervision over 24th through 28th edition.

PARK, JULIAN, Ph. D.
Professor and Head of Department of History, State University of New York at Buffalo; also Dean of the College of Arts and Sciences.

Reviewed and revised World History; also the World History Tables for the first edition.

PFAHL, JOHN K., B. A., M. B. A., Ph. D.
Assistant Professor of Business Organization, The Ohio State University.

Revised Investments, 24th edition.

PHELPS, JEWELL, B. S., M. A., Ph. D.
George Peabody College for Teachers, Nashville, Tenn.

Revised Physical Geography, 26th edition.

PHILLIPS, LYLE W., B. S., M. A., Ph. D.
National Science Foundation, Washington, D.C. Former Professor and Head of Department of Physics, State University of New York at Buffalo.

Contributed the Department of Physics.

PINSON, WILLIAM H., Jr., Ph. D.
Research Associate, Department of Geology and Geophysics, Massachusetts Institute of Technology.

Contributed Astronomy for the 22d edition.

QUANTIUS, FRANCES WELLS, B. A., M. A., Ph. D.
Professor of Economics, The Ohio State University.

Revised Business, Banking, Legal Terms, 26th and 34th editions.

REEDER, WARD GLEN, A. B., A. M., Ph. D.
Professor of Education, Ohio State University.

Revised Education, 17th edition.

RHODENIZER, VERNON BLAIR, Ph. D.
Professor of English Literature, Acadia University, N. S.

Contributed article on Canadian Literature.

ROSS, WILBERT DAVIDSON, A. B., A. M.
Professor and Head of Department of History and Government, Kansas State Normal School, Emporia, Kansas.

Revised Central and South America.

RUDWICK, ELLIOTT M., B. S., M. A., Ph. D.
Professor of Sociology and Senior Research Fellow, Center for Urban Regionalism, Kent State University, Kent, Ohio.

Reviewed Negro studies for the 33rd edition.

SCHWENDEMAN, JOSEPH R., M. A., Ph. D.
Head of Department of Geography, University of Kentucky. Contributor to *World Political Geography.*

Revised Asia, Africa, and Australia, 18th edition.

SCOTT, ERNEST
Professor in the Department of History in the University of Melbourne, Australia.

Contributed the article on Australian History.

SEABORG, GLENN THEODORE, A. B., Ph. D.
Professor of Chemistry, University of California.

Revised Chemistry for the 17th edition.

SEIBERT, RICHARD HUNTER, A. B., M. D.
Senior Clinical Instructor in Medicine, School of Medicine, Western Reserve University.

Contributed article on War Against Disease for 30th edition.

SHEARER, RONALD A., B. A., M. A.
Instructor of Economics, The Ohio State University.

Revised Money and Banking, 24th edition.

SIMONDS, LOIS A., B. S., M. S., Ph. D.
Assistant Professor of Agricultural Economics, The Ohio State University.

Revised the Drainage, Fisheries, Horticulture, and Irrigation sections of Agriculture for the 34th edition.

SMITH, EDWARD S., M. E., M. S., Ph. D.
Professor of Mathematics, University of Cincinnati.

Revised Mathematics and contributed Calculus, 25th edition.

SNOW, ROYALL H., S. B., B. A., B. Litt.
Professor of English, Ohio State University.

Reviewed and revised American and English Literature and Literary Plots for the 17th edition.

JACK A. SOULES, B. S., M. S., Ph. D.
Dean of the College of Arts and Sciences, Cleveland State University.

Revised Chemistry and Physics, 34th edition.

STEELE, HOWARD L., B. S., M. S., Ph. D.
Associate Professor of Agricultural Economics, The Ohio State University.

Revised Agriculture for the 34th edition.

SULLIVAN, PEGGY, A.B., M.S. in L.S.
Director, Knapp School Libraries Project.

Revised the Family Library article and Literature in Early Childhood Education.

TAYLOR, G. GENE, B. S. M., A. M., Ph. D.
Professor of Music and Music Education, Capital University, Columbus, Ohio.

Revised the section on Music, 28th edition.

TAYLOR, JOHN W., M. A., Ph. D.

Contributed section on Mythology and numerous other articles, having been editor or contributor from the first edition.

VIZETELLY, FRANK HORACE, Litt. D., LL. D.
Late Managing Editor of New Standard Dictionary of the English Language.

Revised and expanded Good Usage.

WARFEL, JOHN HIATT, B. Sc., M. Sc., Ph. D.
Assistant Professor of Anatomy, School of Medicine, State University of New York at Buffalo.

Contributed the section on Anatomy for the 22d edition and reviewed for the 26th edition.

WESTON, GEORGE BENSON, A. M.
Associate Professor of Romance Languages, Harvard University.

Contributed article on Italian Literature.

WILLIAMS, EDWARD THOMAS, M. A., LL. D.
Late Agassiz Professor of Oriental Languages and Literature, University of California, 1918–27.

Contributed the articles on Chinese Literature and History, Japanese Literature and History.

WILSON, G. LLOYD, M. A., Ph. D., M. B. A.
Professor of Commerce and Transportation, Wharton School of Finance and Commerce, University of Pennsylvania.

Revised Transportation, 2d edition.

ZAPOLSKY, HAROLD S., A. B., Ph. D.
Assistant Professor of Physics, University of Maryland.

Revised Physics for the 30th edition.

ZENKERT, CHARLES ANTHONY, B. A., M. A.
Research Associate in Botany, Buffalo Museum of Science.

Revised Botany, Mineralogy, 16th, 26th editions.

KEY TO PRONUNCIATION

Diacritical Marks

ä, as in farm, father; *à*, as in ask, fast; *ă*, as in at fat; *ā*, as in day, fate; *â*, as in care, fare. *ĕ*, as in met, set; *ē*, as in me, see; *ê*, as in her, perform. *ĭ*, as in pin, ill; *ī*, as in pine, ice. *ŏ*, as in hot, got; *ō*, as in note, old; *ô*, as in for, fought; *o͝o*, as in cook, look; *o͞o*, as in moon, spoon. *ŭ*, as in cup, duck; *ū*, as in use, amuse; *û*, as in fur, urge. *ou*, as in out, about. *oi*, as in oil, boil.

å, *ê*, *ô*, *û* represent the sounds *ā*, *ē*, *ō*, *ū*; they are of shorter quantity but do not lose the quality of the "long" vowel, as in senâte, êvent, ôbey, lectûre.

TH indicates the sound of th in thee, though. In foreign words this symbol indicates a more distinct d sound than in English words, as in the Irish word *Dail*. *zh* stands for the sound of z in azure.

ü cannot be exactly represented in English. The English sound of u as in *luke* and *duke* resembles the original sound of *ü*. *ö* cannot be exactly represented in English. The English sound of u in *burn* and *burnt* is perhaps the nearest equivalent to ö, or œ. K represents ch in German *ich*, *ach*. N represents the nasal tone (as in French) of the preceding vowel, as in *encore* (*äN′kōr′*). H represents the guttural g or j in Spanish words, as in *jefe*.

The principal accent is indicated by a heavy mark,′, and the secondary accent by a lighter mark,′, placed at the end of the syllable

SPECIAL MARKS AND THEIR USES

Punctuation:

, Comma
; Semicolon
: Colon
. Period
— Dash
? Interrogation point, question mark
" " Quotation Marks
! Exclamation point
( ) Parentheses
[ ] Brackets
' Apostrophe
- Hyphen

Footnote Indicators: Used when number of footnotes is small, otherwise numbers or letters are employed, or special indicator marks may be used double.

* Asterisk
† Dagger
‡ Double Dagger
§ Also used to mean section or clause
‖ Also used to mean "is parallel to"
¶ or ℙ Also used to indicate paragraph

Pronunciation Indicators: More common signs used, in English and some foreign languages, usually to show the value or quality of a vowel. Letters are supplied below to show how sign is applied.

ĕ Breve. Pronounce vowel short
ā Macron. Pronounce vowel long
aë Diaeresis. Pronounce vowels as separate sounds
é Acute accent (French)
è Grave accent (French)
ê or â Circumflex accent (French)
ä Umlaut (German). Alters quality of vowels a, o, or u
ç Cedilla (French). Converts hard c to soft c
ñ Tilde (Spanish). Gives effect of a following y

Word Substitutes: Many signs are used as a species of shorthand. Some of the more commonly used follow. Where the sign has a name, the name precedes the meaning.

Λ Caret. Insert
{ or } Brace. Lines belong together
= Is equal to
☞ Index. See
@ At or to
% Per cent
° Degree
′ Minute (subdivision of degree) or foot (feet)
*** or . . . Ellipsis. Words are omitted.
″ Second or inch (inches)
π Pi. The number 3.14159
+ Plus. Add
− Minus. Subtract
× Multiply
÷ Divide
> Is greater than
< Is less than
∴ Therefore
∵ Since
: Is to (term used in expressing proportion)
:: As (term used in expressing proportion)
√‾ Radical. Square root of
℞ Take (used at beginning of prescriptions for drugs)

Proofreader's Marks. These are the more common signs used by publication and printing proofreaders.

Delete letters or words Take out.
Insert space where indicated.
Turn inverted letter marked
tr Transpose letters or words indicated.
Close up letters or words
= Straighten alignment of type.
Move right or left to point indicated.
Raise or lower to point indicated.
eq # Equalize spacing of words.
wf Wrong font Incorrect size, weight or style of letter
x Broken letter or poor type.
stet Let it stand. Disregard marks made.
cap replace letter marked with a capital.
lc Replace With a lower case (small) letter.
bf Reset words in bold face type.
ital Reset words in italic type.
nom Reset words in roman (regular) type.
Insert period where marked
Insert comma where marked
Insert apostrophe per proofreaders mark.

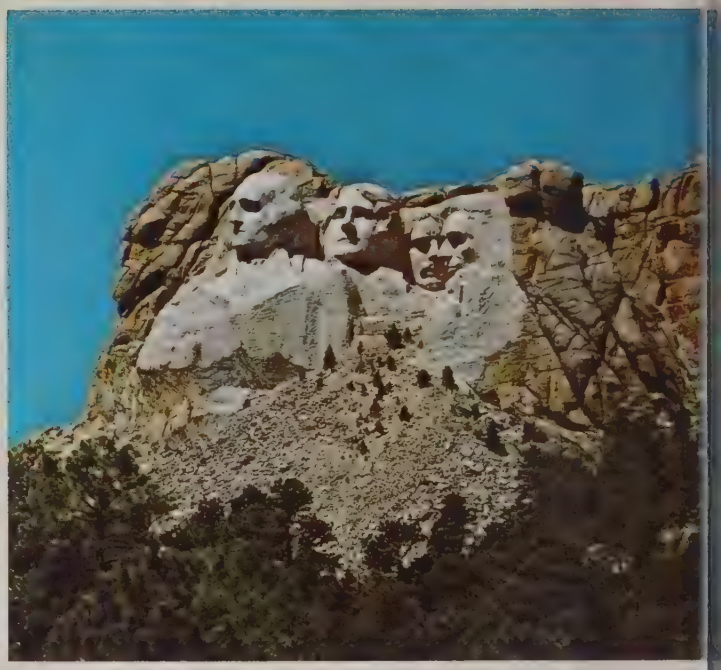
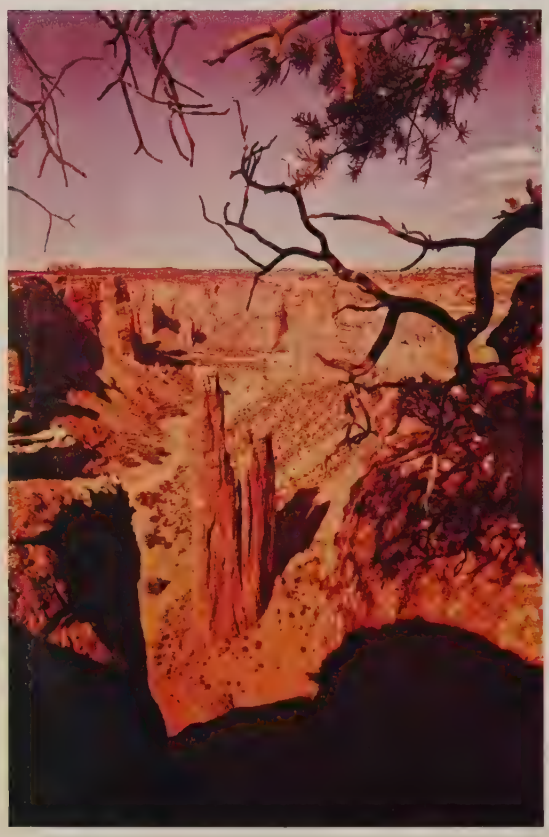
Longs Peak, highest point in the snow-capped Front Range of the Rocky Mountains. Named for explorer Stephen Long, it rises 14,255 feet in Rocky Mountain National Park.

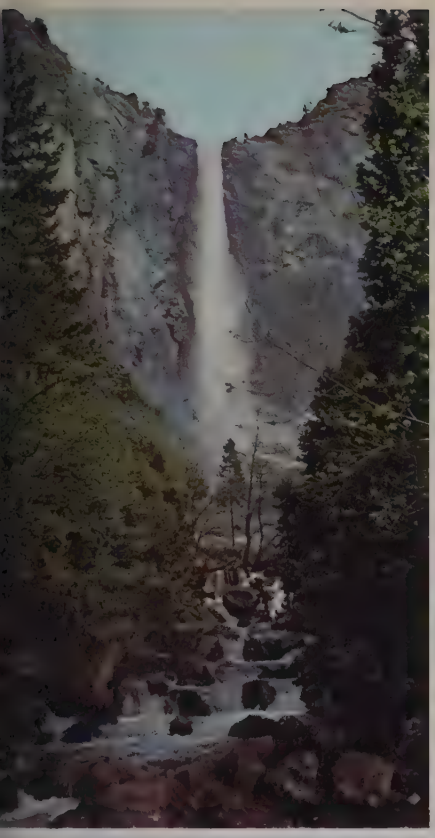


Mt. Rushmore National Memorial was established in 1929 and completed in 1941 in the Black Hills. Sculptor Gutzon Borglum and his son Lincoln carved the colossal busts of Washington, Jefferson, Theodore Roosevelt, and Lincoln.

Spider Rock, Canyon de Chelly, Monument Valley, Arizona. The giant sandstone pinnacle, in an area inhabited by Navajos, rises 800 feet from the canyon floor. The valley became a national monument in 1931.



Bryce Canyon (Utah), covering 56 square miles, was created a national park in 1928. Named for pioneer Ebenezer Bryce, it is noted for magnificent forests and the natural coloring of its eroded rock formations. (*Union Pacific Railroad*)



Above: **Castle Geyser,** Yellowstone National Park, Wyoming. The cone resembles the ruins of an old castle. Established in 1872, Yellowstone is the oldest national park. Left: **Bridalveil Falls** drops 620 feet to the floor of Yosemite Valley in California.

Below: **Grand Canyon,** Arizona, from Bright Angel Point, North rim. The Colorado gorge, 217 miles long and 4–18 miles wide, is a spectacular example of erosion. Discovered in 1540 by Garcia Lopez de Cardeñas, the canyon records vast geologic change.

PHOTOGRAPHY IN EARTH SCIENCE—This panorama of Nevada, Arizona, and California was taken from an aircraft at near-space altitude. Through infrared focusing, the camera defines earth characteristics not evident in normal color or black and white. The results aid in establishing earth resources criteria. The deep reds are reflected from chlorophyll in plant life. In the foreground above is Las Vegas, with scattered lawns and trees. The stream from Las Vegas to Lake Mead (center left) provides moisture for growth along its banks. Flowing from Lake Mead to Lake Mojave, the Colorado River moves through rocky areas without plant life. Right of Lake Mojave lies Needles, Cal., whose irrigated fields provide the large red pattern. At left are mountains tinged with red, indicating forests. For geologists, tonal differences provide a key to earth structure, stratification, and the location of river deltas. Such information is also useful to agronomists and foresters in preserving natural resources. Future applications include determining crop life-cycle states and yields. The data will also assist in locating hidden minerals and oil deposits. Other contributions will lie in expanding air and water pollution controls. (*Courtesy Hycon, Monrovia, Cal.*)

Geography

INTRODUCTION

THE word geography comes from *ge* and *grapho*, two Greek words which, in combination, mean a description of the earth. Geography differs from geology and other sciences of the earth in the fact that geography studies the earth as the abode of mankind. It is closely related, in certain of its aspects, to the sciences of economics, history, astronomy, botany, zoology, and meteorology.

Divisions. Geography is usually classified, on the basis of its subject matter, into mathematical geography, physical geography, or physiography, and biological geography. Mathematical geography concerns the size, shape, and movements of the earth; physical geography deals with the layers of the earth's surface—land, sea, and air; and biological geography studies the life conditions of plants and animals, on the one hand, and of man on the other.

The geography of man discusses the races of mankind and their distribution throughout the earth; it discusses also density of population and the various types of human occupation—fishing, hunting, pasturing, agriculture, mining, manufacture, and commerce. That part of human geography which is concerned with man's industries is classified as economic, or commercial, geography. The study of mankind by countries is known as political geography.

Development of Geography. Nearly all parts of the world have been inhabited by men from very early times and, consequently, have been known in a certain sense. Such knowledge, however, does not constitute geography. The science of geography begins only when people attempt to describe by word or chart the relations of one part of the earth's surface to other parts.

Advance in geographical knowledge has been due mainly to exploration and enterprise. The rate of advance, however, has been highly irregular. Three chief periods of progress may be roughly distinguished: first, that of ancient Greece, when the first serious attempts were made to describe and to explain scientifically the varied conditions of different localities; secondly, the age of discovery, from the 15th to the 19th century, when the main features of the earth were finally learned; and, lastly, the modern scientific period, more or less overlapping the second in time and continuing to the present, when the utmost resources of science have been systematically utilized to chart and to describe every part of the earth's surface.

As a descriptive and systematic science, geography is of comparatively recent origin. Its foundation is due in large part to Alexander von Humboldt, a German scholar who was born in 1769. He developed and supported with observed facts the concept of the earth in evolution, which had been previously set forth in outline by the philosopher Kant. Advancing from this fundamental conception, recent geographers have devoted much of their attention to studies of the effect of geographical environment on human settlement and ways of life.

The Earth and Mankind. The degree of man's dependence on the earth is apt to be obscured in a highly developed society. In point of fact, both in the state of savagery and of civilization, his activities and very life rest solely on the bounty of the earth. A sudden rise or fall of 100° in the mean temperature of the earth's surface would wipe out civilization and probably exterminate the human race.

Climate not only determines what plants and animals can thrive so as to enable any people to subsist, but it exerts decisive effects on their appearance, their stature, their vigor, and their health. The tropics, while bountiful, discourage activity. The polar regions restrict all manner of life. But the seasonal changes of the temperate zones not only predispose populations to activity but force them to make use of their resources to provide against the winters.

Mountains and coasts have served to restrict settlements; rivers and plains, to extend them. Each of these natural features has placed a characteristic imprint on the society which it dominated, largely fashioning its mode of life, its customs, morals, and temperament.

With the growth of inventions, however, the range of the earth's gifts to man has multiplied and has tended to free him from the effects of a restricted environment. Minerals and waterfalls, once useless, now provide shelter, heat, light, power, and transportation in extraordinary abundance. These developments, together with the world-wide exchange of commodities, processes, and ideas, multiply the bonds of man to the earth but also make these bonds much more elastic. To an ever greater degree the earth itself, rather than any particular locality, is becoming the environment of each person. One result is a tendency toward uniformity. Another is an extremely rapid increase of population, the growing pressure of which, in the opinion of many observers, is full of portent for human institutions and customs.

Geography in Schools. The first modern geography in English which was written explicitly for use in schools appeared in 1746. It was called *Introduction to Geography* and was published in England by J. Cowley, "geographer to his Majesty." The first professor of geography in an American university was Arnold Henry Guyot, appointed by Princeton University in 1854.

The study of geography has long held an important place in the public schools of America. The manner of teaching the subject, however, has changed considerably in the past 70 years. The major emphasis was first placed on the facts of political geography. More especially in the years following 1890, physical geography received greater attention. In the past few decades, the study of "home geography" has been favored, chiefly as a means of making pupils familiar with geographical causes operating in their own neighborhood; this familiarity in turn has enabled them to see how larger regions of the earth are affected by the same causes. Finally, with the development of human geography, regional studies are encouraged in order to determine the factors of all kinds which have affected human habitation in a particular region or may be expected to do so in the future.

Value of the Study. A knowledge of geography is necessary for the intelligent reading of newspapers and of books. Such knowledge enables one, as a

citizen, to form sounder opinions of the foreign countries with which our government has relations or with which our merchants deal. The study may also impart a new interest to the materials which we handle, enabling us to picture, more or less accurately, the distant scenes from which have come our tin, cork, rubber, tea, chocolate, and other articles of common use.

Geography is, to a large extent, the study of causes. To learn many facts, more or less isolated, about countries, rivers, cities, and peoples has its value. It is more enlightening, however, to understand the *causes* behind the facts; to know, for example, *why* Arizona is dry, *why* northern Europe is warmer than Labrador, and *why* Chicago has grown up where it is. Familiarity with the reasons lying behind such facts gives us a new interest also in the conditions of our own locality.

Travel. Improved means of transportation within the past century have made it possible for hundreds now to travel for each one that did so in earlier times. Travel has become a new form of enjoyment and a new means of instruction. The novelty of unfamiliar scenes, the glamor of places famous in history, the fascination of nature in its most charming or its most desolate aspects, engage the mind and bring home to it the varied panorama of the great world in which we live.

Geography a Substitute for Travel. Many people, however, lack the financial means and the leisure necessary for extensive travel. For such people, geography provides the nearest equivalent of travel. By the printed word and by picture, one may visit the most interesting and the most remote parts of the world. He may see the head-hunters of Borneo, the crowded cities of China, the treeless steppes of central Asia, or the jungles of the Amazon. Under the guidance of what he reads, he may take a trip to the "land of the midnight sun," and he may enjoy the beauties of Yellowstone Park or of Paris.

Plan of Department of Geography. In the following pages, the geography of the world is treated by continents. This plan has at least two distinct advantages over an alphabetic arrangement of geographical topics. In the first place, it is possible in this way to bring into strong relief the contrast between the continents. Secondly, the reader is enabled to obtain a single view of each continent as a whole. There are certain aspects of geography which cannot be classified under continents. Such, for example, are the oceans, the zones, and the movements of the earth. A treatment of these general facts concerning the earth precedes the description of the continents.

Treatment of Countries. Following the general account of each continent, the countries and other political divisions within it are described in more detail. For the United States, the treatment has been made regional, each subdivision consisting of a group of states having a common geographic character. An exception is made of the off-shore states of Hawaii and Alaska, each of which is treated separately. Moreover, information regarding the individual states has been grouped in several tables, carefully prepared with a view to conciseness, easy visualization, and ready comparison.

Cities and Other Points of Interest. The description of countries or other divisions is followed by sections in which, under alphabetic arrangement, the cities, towns, and other places of interest are each accorded a special treatment. In the selection of such places, the guiding principle has been the importance of the place and its interest to the general reader. The lists contain the capitals of all countries as well as those of the American states and of the Canadian provinces. They contain also the important cities in all parts of the world. A very large number of other places are included. Some of these are notable for historic reasons, such as Yorktown or Ypres. Others are chosen because their names have become associated with a particular industry, such as Waltham, Mass., or Limoges, France. Many places are described which are not incorporated settlements. These include such features as Pikes peak, Mammoth cave, and Lincoln highway in America or Belleau woods and the Riviera in Europe. An instructive section has been added also on the meanings of place names.

Scope. In mere extent of text, this department far exceeds the volume of the average school geography, being more thorough in treating each subject and more inclusive in the selection of topics, especially topics that have recently become important. The point of especial distinction, however, is the addition of material having a travel interest. The study of geography is thereby made more entertaining and far more helpful to the student.

Purposes. The department of geography is not intended to be used as a textbook for the schoolroom. It is too complete for that purpose. On the other hand, it does not purport to describe every place, without exception which appears on the map. In other words, it is not an atlas or a gazetteer. Consequently, it is neither dry nor mechanical. It is much more than a textbook or an atlas.

This treatment of geography has three principal purposes. In the first place, it contains a rich store of supplementary material both for the student and for the teacher of geography. Secondly, when used in connection with the review questions, it provides an extremely valuable aid for any person desiring systematically to study geography by himself. Lastly, it is an excellent source of general information for all ages and all classes of people.

Statistics. The figures published in this department have been prepared with unusual care. Those representing factors which constantly change, such as population and trade, are based, in all cases, on the latest official bulletins.

It is a fact that even in statistics representing such constant factors as the length of coast lines and areas of districts adjoining the sea, a considerable divergence often appears among geographical authorities. Such differences are frequently due to methods of measurement. A coast line, for example, may be surveyed from headland to headland, and the result obtained may be much less than the total arrived at by including all the insignificant inlets. Somewhat similar difficulties arise in statistics regarding lengths of rivers, heights of mountains, and many other such measurements.

These difficulties, however, detract nothing from the real value of statistics, which is to enable the reader to make comparisons. For ordinary purposes it is of no significance whether Mount Everest is 29,002 or 29,000 feet high or whether Mount McKinley is exactly 20,300 feet in altitude. The essential value of the figures is in showing that Mount Everest is about 9000 feet higher than Mount McKinley. In spite of such considerations, however, the statistics in this department represent the most painstaking efforts to reconcile authorities where they differ and to attain a degree of accuracy that is difficult to find in similar material.

Maps. Geographical position has been indicated throughout the text with a view to enabling the reader, by consulting the pertinent maps, to see at a glance the location of the principal places. The maps have been recently revised and take into account the numerous changes that have occurred during and since World War II.

Spelling of Names. The form of the names in the text has been made, in most instances, to conform with the spelling adopted by the United States Geographic Board. Those names which have not been made the subject of decisions by this board follow the spelling of the National Geographic Society, or, failing authority from either source, they conform to Webster's *Gazetteer.*

GEOGRAPHICAL DISCOVERY

Ancient ideas of the earth were vastly different from those of the present day. One of the earliest concepts of the earth is that revealed by the Homeric poems, written about 1000 B. C. In these poems, the earth is supposed to be a circular disk surrounded by a river, which was called Ocean.

Phœnicians. Such early views were probably based on the reports of the Phœnicians, who were the earliest navigators known to history. From these people, too, in all likelihood, came the information which the Hebrews had regarding such distant points as those called, in Hebrew literature, Gomer, Sinim, Cush, Sheba, Ophir, and Tarshish. Gomer is believed to mean the northern shores of the Black Sea; Sinim is conjectured to be southern Egypt; Cush is identified with Abyssinia; Sheba, with Yemen in southwestern Arabia; Ophir is placed in southeastern Africa; and Tarshish, in southeastern Spain.

Africa was circumnavigated as early as 600 B. C. by a Phœnician expedition. This expedition was dispatched by Necho, king of Egypt, with orders to sail through the Red Sea into the Indian Ocean and around Africa. After three years, the ships returned by way of the Strait of Gibraltar and the Mediterranean Sea.

Greeks. The earlier Greek geographers, Hecatæus and Herodotus, both of the 5th century B. C., did not advance beyond the idea of the earth conceived of as a disk. Hecatæus in his *Periodos*, "Trip around the World," and Herodotus in his *Histories*, added immensely to the available knowledge of different lands and peoples, each writer having traveled over most of the world as then known.

Aristotle, living in the 4th century B. C., has the honor of being the first to demonstrate that the world is a sphere. He based his proof on two facts which could be tested by observation: first, that the shadow of the earth thrown on the moon during an eclipse is always circular; and, secondly, that the horizon always retreats as the observer advances. To Aristotle also is due the division of the earth into a torrid zone bounded by two temperate zones with a frigid zone surrounding each pole.

It was in this period that maps of the world first showed the land surface of the earth surrounded by a wide expanse of sea instead of by a river. The name Ocean, which formerly designated the river, was applied to this sea. The sea was believed to extend around the globe, bathing on every side the great land mass in the eastern hemisphere. Our modern sense of ocean, as one of the major divisions of the water surface of the earth, arose since the 15th century, when it was learned that the universal sea was divided into parts by the continent of America and by other land areas previously unknown.

The inclination of the earth to the plane of its orbit was first measured by Eratosthenes, who lived in the 3d century B. C. His result was correct within 23 minutes of the angle as determined by the most accurate modern instruments. Eratosthenes also calculated the size of the earth and devised a system of indicating geographical position by drawing two lines of reference, one from east to west and the other from north to south. The location of any place could thus be indicated by giving its distance north or south of the one line and east or west of the other line.

The lines of reference drawn on the earth by Eratosthenes suggested to Hipparchus of Nicæa, in the 2d century B. C., the idea of drawing a series of circles of latitude and longitude. One circle was drawn for each degree on the earth's surface. In the 2d century A. D., Ptolemy, a Greek of Alexandria, compiled a work on geography which embraced all that was known of the earth until his day. This work formed the starting point of modern geography.

According to Ptolemy's geography, Africa extended southward and eastward, eventually joining Asia. The two continents thus enclosed the Indian Ocean. The farthest land to the north was called Thule, probably the Shetland islands. Something also was known of the Baltic Sea, western Russia, the great plains of Asia, and even the distant countries of China and Japan.

Romans. The Romans did little in the field of scientific geography. For the purpose of conquest and organization, however, surveys were made of practically all the territory surrounding the Mediterranean Sea, as well as of France, part of Britain, and Asia Minor. Nero dispatched an expedition in search of the source of the Nile river about 60 A. D. In the 6th century A. D., Justinian sent two monks to China, who returned with eggs of the silkworm concealed in a hollow cane. The culture of the silkworm was thus introduced into Europe.

Middle Ages. With the general decline of learning after the downfall of Rome, Ptolemy's work was forgotten in Europe, and people reverted to a primitive conception of the earth, believing it to be flat. Maps of this period frequently show Jerusalem as the center of the terrestrial disk.

The Arabs, however, translated Ptolemy's work into their own language, keeping alive a knowledge of geography as it had been developed. Arab astronomers measured a degree of latitude on the plains of Mesopotamia, deducing from it the approximate size of the earth. Prominent among Arabian books of travel was the *Meadows of Gold*, written by Masudi about 950 A. D. It contained geographical observations collected by its author, who, with this purpose in view, traversed all the countries lying between China and Spain. Ptolemy's geography became known to Europe by translation into Latin from the Arabic and later from the original Greek text.

Earliest Modern Discoveries. Before the period of the Renaissance, a number of notable voyages and discoveries were recorded. Greenland was sighted by Northmen in the 9th century, and, in the following century, men of the same race landed on the coast of North America. Little geographic interest, however, was aroused by these discoveries or by the trips of monks to remote parts of Asia and of Africa in search of a mythical Christian kingdom, ruled over by Prester John. The travels of Marco Polo, however, in the 14th century, did much to stimulate interest in distant lands. He visited the Far East, where he ruled a province of China for three years. A golden statue of him in a great temple at Soochow, China, still bears witness to his former influence in the Orient.

Age of Discovery. The 15th and the 16th century were distinguished by extraordinary activity in exploration. The previous invention of the mariner's compass did much to facilitate the sea voyages of the period.

Portuguese sailors discovered the Madeira islands and, by 1482, had sailed south as far as the Congo river. In 1486, a Portuguese ship sighted the Cape of Good Hope, and, 11 years later, Vasco da Gama doubled the cape and finally reached India.

In 1492, Columbus, sailing west, discovered the New World and thereby revolutionized the prevailing conception of the earth. Within 30 years from his historic landing on San Salvador island, the whole east coast of America from Greenland to Cape Horn had been explored, and the globe had been circumnavigated. Before the middle of the 16th century, America's west coast had been explored as far north as San Francisco bay, and Spanish colonists had settled in various parts of South America. On the other side of the world, progress had been made in knowledge of countries whose coasts were bathed by the Indian Ocean, including

Arabia, East Africa, India, and the great Malay archipelago. Apart from the Portuguese and the Spaniards, the nations most active in discovery at this period were the English, the Dutch, and the French.

The 17th and the 18th century witnessed the discovery of Australia, Tasmania, and New Zealand. Captain Cook, an English navigator, in the last quarter of the 18th century, explored widely in the Pacific Ocean, adding Hawaii and numerous other islands to the known world.

The task of geographical discovery was completed in the 19th and the 20th century. The chief accomplishments in this period were the exploration of Africa; the forcing of a passage by water northwest of America and of a passage through the ice-bound seas northeast of Asia; and, finally, the discovery of the north and south poles. The exploration of Africa is described in the section devoted to that continent.

Polar Exploration. Repeated efforts were made, from the 16th century on, to sail around North America's northern boundary. It was thought for many years that North America terminated in a northern cape, just as South America tapers to a cape at its southern extremity. As no such cape was found in the north, many later geographers believed that North America extended in an unbroken land mass to the north pole. The overland journeys of Hearne and Mackenzie, however, refuted that error and proved that an ocean washed the northern limits of the western continent.

Among the navigators who tried to effect this northwest passage from the Atlantic to the Pacific Ocean were Davis, Hudson, Baffin, Scoresby, Parry, Ross, and Franklin. Finally, in 1851-53, McClure, entering from Bering Strait, was forced to abandon his ship on Banks Land, but he and his crew were brought out to Baffins Bay by another expedition, thus demonstrating the northwest passage. In 1903-06, Roald Amundsen sailed by a more southern route from Baffins Bay to San Francisco. In 1878-79 Nordenskjöld sailed through the northwest passage from Sweden to Bering Strait.

The quest for the north pole engaged many explorers during the latter half of the 19th century. These include Greely, Nansen, and the duke of Abruzzi. The goal was actually reached, however, by Peary, who, on April 7, 1909, raised the American flag over the north pole.

Land was first found in the south polar region by Pierre Bouvet (French) in 1739. The first explorer known to have crossed the Antarctic Circle was Cook (British) in 1773. Further explorations were made by Bellingshausen, Biscoe, Weddell, Ross, Dumont d'Urville, and Borchgrevink. The pole was finally reached December 14, 1911, by the Norwegian explorer Amundsen. Just five weeks later, Captain Scott, an Englishman, arrived there. While returning, Scott perished a few miles from a relief station.

Recent Geographical Research. With the discovery of the two poles, the age of discovery came to an end. The next and more arduous step remained, to investigate and map regions already known only in outline. Mount Everest, the world's highest mountain, was first scaled in 1953 by Hillary (New Zealand) and Norkay (Nepal). Mapping of inaccessible regions was advanced rapidly by many countries through the use of aerial photography. Many geographical expeditions were sponsored by scientific societies, notably the National Geographic Society of Washington, D.C., which pioneered in reporting its findings in popular form. A spectacular example of Antarctic research was Richard E. Byrd's establishment of a "Little America" in 1929 not far from the south pole.

More systematic researches were undertaken in the so-called Geophysical Year (1957–58), when all the resources of science were brought to bear on the mysteries of the earth. Meanwhile, with an assist from atomic devices, geology and archeology were unlocking many of the secrets of historical geography, aiming to show what the earth was like in earlier ages. *See Antarctica, Geophysical Year.*

DATES OF GEOGRAPHICAL DISCOVERIES*

	B. C.
Phœnicians circumnavigate Africa	600
Himilco, Carthaginian merchant, at Ierne (Ireland)	500
Hanno, Carthaginian navigator, off Sierra Leone, Africa	470
Alexander the Great in the Punjab, India	327
Nearchus, Greek general, in the Indian Ocean	325
Pytheas of Marseilles at Ultima Thule (Shetland Islands)	320
Eudoxus, Greek sailor, crosses the Arabian Sea	118
Julius Cæsar in England	55
	A. D.
Cosmas Indicopleustes, Egyptian merchant, in India	550
Suleiman, Arab trader, voyages to China	850
Ottar, Norwegian explorer, rounds the North Cape, Europe	852
Sindbad the Sailor on the coast of India	9th c.
Al Masudi, Arab traveler, in China	920
Iceland colonized from Norway	930
Eric the Red colonizes Greenland	982
Benjamin of Tudela, Spanish traveler, visits India	1160–73
Friar John of Carpini, visits Karakorum, Asia	1246
Rubruquis, Flemish traveler, explores the Caspian Sea	1247
Marco Polo, the Venetian, at the Court of Kublai Khan, China	1270
Fr. Odoric, of Pordenone, Italian monk, enters Lhasa, Tibet	1320
Ibn Batuta, the Arab traveler, reaches Quiloa, E. Africa	1329
Ibn Batuta visits Timbuktu and the Niger River	1350
Clavijo, a Spanish knight, ambassador at Samarkand	1405
Zarco, Portuguese navigator, sights the Madeira Islands	1418
Conti, Italian traveler, explores southern China	1440
Cintra, Portuguese navigator, at Sierra Leone, Africa	1462
Cão, Portuguese navigator, discovers the Congo River, Africa	1484
Bartholomew Diaz, Portuguese navigator, doubles the Cape of Good Hope, South Africa	1488
Covilhão, Portuguese ambassador, penetrates into Abyssinia	1490
Columbus, Italian navigator, discovers San Salvador Islands, West Indies	1492
Vasco da Gama, Portuguese navigator, voyages to India by the Cape route	1497
John Cabot, Italian navigator in English service, lands on coast of North America	1497
Vespucci, Italian navigator, coasts along North American and South American shores†	1497–1503
Cabral, Portuguese explorer, discovers South America	1500
Pinzon, Spanish navigator, at the mouth of the Amazon, South America	1500
Columbus sights Central America	1502
Varthema, Italian traveler, visits the sacred city of Mecca	1503
Serrão, Portuguese sailor, reaches the Molucca Islands by way of India	1512
Balboa, Spanish explorer, discovers the Pacific Ocean	1513
Ponce de Leon, Spanish explorer, traverses Florida	1513
Solis, Spanish navigator, ascends the La Plata River, South America	1516
Grijalva, Spanish navigator, touches coast of Mexico	1518
Cortés, Spanish adventurer, in central Mexico	1518
Expedition of Magellan circumnavigates the globe	1521–22
Pizarro, Spanish adventurer, in Peru	1532
Cartier, French navigator, in the Gulf of St. Lawrence	1534
Coronado, Spanish explorer, marches from Mexico through Arizona and New Mexico to Kansas	1539–42
Alarcon, Spanish explorer, reaches the Colorado River, U. S.	1540
Cardenas, Spanish explorer, at the Grand Canyon, Arizona	1540

*Dates for ancient and medieval discoveries in various instances are only approximate.

†According to his narratives, the trustworthiness of which is disputed.

	A. D.
De Soto, Spanish explorer, discovers the Mississippi River	1541
Orellana, Spanish explorer, descends the Amazon	1541
Cabrillo, Portuguese navigator, on California coast	1542
St. Francis Xavier, Spanish Jesuit missionary, visits Japan	1549
Chancellor, English navigator, reaches the White Sea, Russia	1553
Willoughby, English navigator, sights Nova Zembla	1553
Gaetano, Spanish navigator, lands on the Hawaiian Islands	1555
Jenkinson, English traveler, reaches Persia	1561
Frobisher English navigator, in Frobisher Bay, Arctic North America	1576
Davis, English navigator, in Davis Strait, Arctic North America	1587
Barentz, Dutch navigator, at Spitzbergen, Arctic Europe	1594
Western Australia sighted by Portuguese sailors	1601
Gosnold, English navigator, at Cape Cod, United States	1602
Göes, a native of the Azores, traverses Central Asia	1603–05
Champlain, French explorer, on Maine coast, United States	1604
Torres, Spanish navigator, in New Guinea	1606
Smith, English colonist, in Chesapeake Bay	1608
Hudson, English navigator, ascends Hudson River to present site of Albany	1609
Champlain, French colonizer, discovers Lake Champlain	1609
Hudson, English navigator, discovers Hudson Bay, Canada	1610
Baffin, English navigator, in Baffin Bay	1616
Hartog, Dutch navigator, on the Australian coast	1616
Schouten, Dutch navigator, discovers Cape Horn, South America	1616
Nicolet, French voyager, reaches Lake Michigan	1634
Tasman, Dutch navigator, at Tasmania	1642
Deshnev, Russian navigator, sights Bering Strait	1648
Fr. Menard, French missionary, reaches Lake Superior	1660
Marquette and Joliet, French explorers, reach the Arkansas River	1673
Fr. Hennepin, Flemish missionary, at Niagara Falls, Canada	1678
Fr. Hennepin, at St. Anthony Falls, U. S.	1680
La Salle, French explorer, descends the Mississippi	1682
Fr. Kino, Spanish Jesuit, discovers the Casa Grande ruins, U. S	1694
Bering, Danish navigator, in Bering Strait	1728
Gwosdef, Russian sailor, lands on the Alaskan coast	1731
Verendrye, French explorer, reaches the Rocky Mountains	1740
Karstens Niebuhr, German traveler, explores Arabia	1761–67
Bruce, Scotch traveler, on the Blue Nile, Abyssinia	1768–73
Hearne, English traveler, discovers Great Slave Lake	1772
Cook, English navigator, first to cross the Antarctic circle	1773
Cook, English navigator, explores the Hawaiian Islands	1774–79
Peter Pond, Canadian explorer, reaches Lake Athabaska	1778
La Perouse, French navigator, explores eastern coast of Asia	1787
Mackenzie, Scotch explorer, discovers the Mackenzie River, Canada	1789
Gray, American navigator, ascends the Columbia River, U. S.	1792
Mungo Park on the Gambia river, West Africa	1795
Humboldt, German scientist, explores South America	1799
Lewis and Clark explore the northwestern United States	1804–06
Colter, American trapper, discovers Yellowstone Park, U. S.	1807
Hutchins, American pioneer hunter, discovers the Mammoth Cave, United States	1809
Bellingshausen, Russian navigator, on the Antarctic continent	1821
Clapperton and Denham, English travelers, cross the Sahara	1822
James Bridger, American explorer, discovers Great Salt Lake, United States	1824
Sturt, English explorer, traverses Australia	1828
Ross, English navigator, in Boothia Felix, Arctic North America	1831
Schoolcraft, American scientist, discovers Lake Itasca	1832
Wilkes, American navigator, on the Antarctic continent	1840
Abbé Huc travels in Tibet	1844
Krapf and Rebmann, German missionaries, at Mt. Kilimanjaro, East Africa	1848
McClure, Irish navigator, achieves the Northwest Passage, Arctic Ocean	1851
Boling, American soldier, visits the Yosemite	1851
Livingstone, Scottish missionary, discovers Zambesi River	1851–56
Kane, American explorer, on Grinnell Land, Arctic North America	1853
Livingstone, Scottish missionary, at Victoria Falls, Africa	1855
Barth, German traveler, explores the Sudan	1856
Burton and Speke, English explorers, discover Lake Tanganyika, Africa	1858
Speke, English explorer, discovers Victoria Nyanza, Africa	1858
Burke and Wills, Irish explorers, cross Australia from south to north	1860–61
Richthofen, German scientist, explores China	1868–72
Przhevalski, Russian traveler, crosses Mongolia	1871–73
Stanley, American explorer, traces the course of the Congo	1876–77
Nordenskjöld, Swedish explorer, accomplishes the Northeast Passage, Arctic Ocean	1878–79
Borchgrevink, Norwegian explorer, at the South Magnetic Pole, Antarctic continent	1899
Hedin, Swedish scientist, explores Central Asia	1890–1908
Peary, American naval officer, proves the insular character of Greenland	1892
Roald Amundsen, Norwegian navigator, sails through Northwest Passage	1903–06
Peary discovers the North Pole	1909
Amundsen discovers the South Pole	1911

GENERAL FACTS ABOUT THE EARTH

The earth, or globe, is an oblate spheroid; that is, a sphere slightly flattened at two opposite points, called the poles. The two poles are the ends of the axis about which the globe rotates. The north pole is in the Arctic Ocean. The south pole is in the continent of Antarctica, which, directly at the pole, reaches an elevation of about 10,000 feet.

In order to make it possible to describe the exact location of any place on the earth, geographers have drawn around the globe certain circles, to which the position of any point may be referred. The equator is such a circle, encompassing the earth equidistant from the poles. Other circles are drawn parallel to the equator, dividing the distance between the equator and each pole into 90 equal parts. These circles are called parallels of latitude, and the distance between successive circles is called a degree. A degree (°) of latitude measures about 69 miles. Parallels of latitude are numbered from the equator north and south. Thus the north pole lies at 90° north latitude, and the south pole is at 90° south latitude. In passing from the north pole to the south pole, a traveler would traverse 180° of latitude and, in completing the circuit of the earth, he would pass through a total of 360° of latitude.

A second series of circles, 180 in number, is drawn about the earth, each circle passing through both poles. That half of each circle which extends from one pole to the other is called a meridian of longitude. Since each circle consists of 2 meridians, the 180 circles comprise a total of 360 meridians. Meridians are distant from each other about 69 miles at the equator. As one approaches the poles, however, the distance between two successive meridians decreases. Thus a degree of longitude is not constant, but varies from about 69 miles at the equator to zero at the poles. Meridians of longitude are numbered east and west from the meridian passing through Greenwich, England. The 180th meridian of east longitude coincides with the 180th meridian of west longitude, this meridian being the meridian in the western hemisphere corresponding to the Greenwich meridian in the eastern hemisphere.

The rotation of the earth takes place from west to east—the direction opposite to that in which the hands of a clock move. This movement of the earth causes the alternation of day and night.

A second movement of the globe is its revolution about the sun. The revolution takes place in an almost circular orbit. The earth's axis is not perpendicular to the plane of this orbit, but is inclined 23½° away from the perpendicular. To this inclination are due the varying lengths of day and night at different latitudes and in different seasons and also most of the seasonal variations in temperature. It provides the basis also for the division of the earth into zones, or "belts."

The boundaries of the zones are determined by the noonday inclination of the sun's rays to the surface of each zone. Thus the Torrid Zone comprises that part of the earth over which, at some time of the year, the sun is directly overhead. This zone extends for 23½° of latitude north and 23½° of latitude south of the equator, so that it has a total width of 47° of latitude. The North Frigid Zone and the South Frigid Zone, each of which extends 23½° of latitude from the poles toward the equator, comprise those parts of the earth in which, at some time in the year, the sun does not rise above the horizon at noon. Of the two remaining zones,—the North Temperate Zone and the South Temperate Zone,—each occupies 43° of latitude. In these zones, the sun never stands directly overhead and never remains for a whole day beneath the horizon. The variations of temperature between the different seasons are least in the Torrid Zone and are greatest in the two frigid zones.

The Torrid Zone is divided from the North Temperate Zone by the circle called the Tropic of Cancer and from the South Temperate Zone by the Tropic of Capricorn. The North Temperate Zone is separated from the North Frigid Zone by the Arctic circle. The corresponding line of division between the South Temperate Zone and the South Frigid Zone is called the Antarctic circle.

The following statistics regarding the earth are based on the latest research and are the nearest available approximations to the actual facts.

Equatorial diameter (miles)	7,926.6
Polar diameter (miles)	7,899.9
Circumference at the equator (miles)	24,901.7
Meridional circumference (miles)	24,859.4
Area of land surface approximately (square miles)	54,000,000
Area of water surface approximately (square miles)	143,000,000
Total area of the earth's surface approximately (square miles)	197,000,000
Volume of the earth (cubic miles)	259,900,000,000
Mean density of the earth	5.53
Density of water	1.00
Density of surface rock	2.72
Density at the earth's center	10.87
Pressure at earth's center (tons per square inch)	22,500
Weight of the earth (tons)	6,592,000,000,000,000,000,000
(Six sextillion five hundred ninety-two quintillion tons)	

CONTINENTS, AREA AND POPULATION

The following table gives the area and the population of each of the continents, as estimated by the latest reliable authorities.

In the present state of geographical knowledge, it is impossible to obtain exact and strictly accurate statistics covering such large divisions of land as the continents. Even for North America, Europe, and Australia, all of which are inhabited by civilized peoples, no complete measurement of the area has been made. Only small parts of South America, Asia, and Africa have been surveyed. Consequently, it is impossible to obtain more than a careful estimate of the extent of land surface in each continent.

In arriving at the figures for population, somewhat similar difficulties have been encountered. It still remains impossible to obtain exact statistics for the number of inhabitants in large parts of Asia and of Africa. Official estimates have been utilized for these regions. In all places where regular censuses are taken, the figures here given are based on the latest returns except in a few instances, in which the most recent official estimates are used.

Name	Area Sq. Miles	Population
North America	9,361,767	309,000,000
South America	6,885,321	180,000,000
Europe	1,903,000	455,000,000
U.S.S.R.	8,649,412	238,000,000
Asia	10,630,105	1,946,000,000
Africa	11,703,849	336,000,000
Oceania	3,286,097	18,500,000
Total	52,419,638	3,483,000,000

Source: United Nations, *Statistical Yearbook*, 1969. Land area includes land and inland waters but excludes uninhabited polar regions and some islands.

OCEANS, AREA AND DEPTH

Authorities differ widely in their estimates of the areas of oceans. This is owing in part to the absence of definite boundaries for separating the oceans. It is due also to the fact that, while some authorities include with the oceans various inland seas, such as the Mediterranean or Hudson bay, other exclude them. See *Ocean*.

Name	Estimated Area Sq. Miles	Greatest Depth Feet	Mean Depth Feet
Arctic	4,000,000	13,120	3,840
Atlantic	34,000,000	27,498	12,660
Indian	28,000,000	22,968	12,888
Pacific	71,000,000	36,056	13,440
Southern or Antarctic	6,000,000	13,932	

HIGHEST, LOWEST, AND MEAN ALTITUDES OF THE CONTINENTS

The following table gives the highest and the lowest point in each of the continents. It will be observed from the figures given that the highest part of the land surface of the earth is the peak of Mount Everest, 29,002 feet above the sea, and the lowest point is the shore of the Dead Sea, which is 1290 feet below the level of the ocean. The land elevation of the world, therefore, varies within the limit of 30,431 feet, or about 5.7 miles. The figures for the mean elevations of the continents are approximations, being the latest estimates published by the United States Geological Survey.

Continent	Mean Elevation* (feet)	Highest Point		Lowest Point	
		Name	Above Sea Level (feet)	Name	Below Sea Level (feet)
North America	2,000	Mount McKinley, Alaska	20,270	Death Valley, Cal.	276
South America	1,800	Mt. Aconcagua, Chile-Arg.	22,835	Sea level	....
Europe	980	Mt. Elbrus, Caucasus Mts.	18,481	Caspian Sea, Russia	86
Asia	3,000	Mt. Everest, India	29,002	Dead Sea, Palestine	1,290
Africa	1,900	Kibo Peak, (Kilimanjaro) Tanganyika	19,565	Libyan Desert	440

* Approximate

NORTH AMERICA

THE land mass of the western hemisphere with the adjacent islands is called America. The name was given in honor of Amerigo Vespucci, an Italian navigator who is said to have visited South America in 1499. It is often styled the New World because of its discovery and settlement in modern times by peoples from the eastern hemisphere, now commonly spoken of as the Old World.

Extent of America. The mainland extending from Alaska in the northwest and from Boothia Felix in the northeast to the south end of Patagonia is about 8700 miles long. This immense length is prolonged to about 9600 miles by the vast archipelago north of Hudson bay and by the island of Tierra del Fuego south of Patagonia. Cape Columbia in Grant Land and Cape Morris Jesup in Peary Land are within 450 miles of the north pole. Cape Horn, the southernmost point of Tierra del Fuego, is 2350 miles from the south pole. Greenland belongs to America, but Iceland, though partly in the western hemisphere, is associated with Europe. The area of America, including islands, is about 16 million square miles.

The Two Continents Compared. America comprises the two continents of North America and South America. These are connected by the narrow Isthmus of Panama. Each continent, like Africa, bears some resemblance to a triangle, the base, or shortest line, being along the northern border, and the apex, at the southern end. The climates, however, of the corresponding parts of the two continents are reversed. The northern part of North America is polar in character, while the northern part of South America is tropical. The physical features of America are displayed on a gigantic scale. There are great rivers, fresh-water lakes that are veritable inland seas, long, lofty ranges of mountains, and vast plains.

North America and South America alike have a chain of mountains extending from north to south along their western sides. Moreover, each continent has a broad central plain and a low eastern mountain range, and both continents have magnificent rivers affording access far into the interior. Vast, unbroken plains and immense forests are other characteristic features common to the two continents.

Extent of North America. The name, North America, is assumed by most geographers to mean all the continent, and all the outlying islands, north of the narrowest part of the Isthmus of Panama. Thus defined, North America includes Central America, Mexico, the West Indies, the United States, Canada, Alaska, and Greenland. For convenience of reference, Central America is often regarded as a separate section of the western hemisphere. The area of North America, including islands, is about 8.5 million square miles.

Oceans and Coasts. North America's shores are washed by the waters of three oceans—the Arctic on the north, the Atlantic on the east, and the Pacific on the west. On the south, the Gulf of Mexico and the Caribbean Sea are large bodies of water also associated with North America. Deep indentations mark the Atlantic coast and form many excellent harbors. The Pacific coast, for the most part, is without sheltered bays, and, in consequence, has fewer seaports.

Surface Features. Two mountain systems dominate the surface of the continent. On the east side is the Appalachian system. This is a series of worn-down mountains, very old geologically, which stretch from the coast plain of the Gulf of Mexico northeast to Labrador. On the west side of the continent rise the lofty ranges of the great Cordilleran system. These massive, rugged mountains are of relatively recent geological formation.

Cordilleran System. As a whole, this system extends in a northwest direction from Central America to the northern shores of Alaska. The most important ranges are the Sierra Madre of Mexico and the Rockies of the western United States, Canada, and Alaska. Between the Rocky mountains proper and the Pacific Ocean lie the Sierra Nevada of California, the Cascades of Oregon and Washington, the Selkirks of British Columbia, and the Coast ranges. Each of more than 30 peaks of the Rocky Mountain chain is over 14,000 feet high. Mt. Whitney, with an altitude of 14,495 feet, in California, is the highest peak in the continental United States. Mt. Logan, 19,850 feet high, in Yukon Territory, is the loftiest summit in Canada. Mt. McKinley, with a height of 20,270 feet, in Alaska, is the culminating point of North America.

Between the Appalachian system in the east and the Rocky Mountain system in the west lie the great medial plains. These occupy a central depression extending from the Arctic Ocean to the Gulf of Mexico. In this vast valley are situated Hudson bay, the Great Lakes, and the drainage basins of many large rivers.

Appalachian System. The Appalachian Mountain system, which trends generally northeast and southwest, consists of numerous ranges. Among these are the Great Smoky, the Allegheny, the Blue Ridge, the Catskill, the Adirondack, the Green, and the White mountains in the United States and the Notre Dame mountains in Quebec. The loftiest summit is Mt. Mitchell, 6684 feet high, in North Carolina.

Great Basin. A vast plateau, called the Great Basin, with an elevation of from 5000 to 7000 feet, lies between the lofty Wasatch range of eastern Utah and the still higher Sierra Nevada of eastern California. In this arid region, rivers disappear in sandy wastes or flow into saline marshes and salt lakes. North of the Great Basin is the less elevated and more fertile Columbia River plateau, situated between the Rockies and the Cascades. Between the Rocky mountains and the Coast ranges of Canada, a somewhat lower plateau, called the Northern Interior plateau, extends northwest to Alaska where it joins the Yukon plateau named for the great river which drains it.

Colorado Plateau. South of the Great Basin is an immense elevated tract called the Colorado plateau. This forms a plain that extends far into Mexico but attains its widest development in the southwestern United States. Much of this vast highland is from 7000 to 9000 feet above sea level. In it the Colorado river and its tributaries have carved the most stupendous examples of erosion in the world.

Mexican Plateau. This is the southeastern continuation of the great Colorado plateau. In shape, the Mexican plateau, called also the plain of Anahuac, resembles a broad wedge, with its widest portion adjoining the southwestern United States and with its narrowest portion extending to southern Mexico.

This interior plain is bordered both on the east and on the west by high ranges of the Sierra Madre, those on the west having an average elevation of 10,000 feet. On either side, the mountain slopes which face toward the sea are usually very steep and precipitous, while those which face inland toward the plateau are, for the most part, much more gentle.

The Mexican plateau increases in elevation southward, rising from about 3500 feet above sea level, opposite western Texas, to 9000 feet around the southern border. In the high southern portion lies the famous "valley of Mexico," containing Lake Tezcuco, on the shores of which were built the ancient Aztec capital and the present city of Mexico.

Medial Plains. Because of their immense extent in the northern part of the continent, the medial plains are sometimes called the Arctic valley. The width of this region, measured from the highlands of Labrador to the Rockies of northern Alberta, is fully 2000 miles. Between the Allegheny mountains of Pennsylvania and the Rocky mountains of Colorado, the plains region is about 1400 miles wide. This central depression extends south from the Arctic Ocean to the Gulf of Mexico, a distance of about 3000 miles. In this vast interior portion of the continent lie the drainage basins of large river systems. The most important of these are the Mississippi-Missouri draining into the Gulf of Mexico, the Saint Lawrence flowing into the Atlantic Ocean, the Nelson-Saskatchewan emptying into Hudson bay, and the Mackenzie-Athabaska with outlet to the Arctic Ocean. The total area drained by the four systems is about three million square miles.

Rivers. Numerous navigable rivers afford entrance to the interior of the continent. The Mackenzie and the Yukon, flowing into northern waters, are icebound during the greater part of the year. The Saint Lawrence, which flows into the Gulf of Saint Lawrence, is likewise frozen during the winter months. But portions of the Hudson, the Delaware, the mighty Mississippi with many important tributaries, are open practically all the year, as are also the navigable parts of the Rio Grande, the Colorado, the Sacramento, the Columbia, and numerous lesser streams. These provide transportation for much inland commerce and some furnish water for irrigation purposes.

Lakes. Besides the five Great Lakes in the east central part of the continent, there are several other large lakes. Of these, the most important are Great Bear lake, Great Slave lake, and lakes Winnipeg and Athabaska, situated in central and northwestern Canada. In the western United States is Great Salt lake. This is a relic of a former sea which, in geological times, occupied a large part of the Great Basin.

Glaciers. The most extensive remnants of the ice age on the mainland of North America are found in the coastal mountains of Alaska. Some of the great glaciers in the region bordering on the Gulf of Alaska are hundreds of square miles in extent. These continental glaciers, however, are very small when compared with the immense ice sheet that covers the greater part of Greenland. The higher mountains from Colorado and California northwestward to Alaska contain many glaciers.

Volcanoes. In North America, as in South America, there are extensive volcanic areas in the great mountain system bordering on the Pacific coast. Central America contains many active volcanoes, among the most noted of which are Coseguina, Izalco, Cerro Quemado, Santa Maria, Fuego, and Agua. On the Mexican plateau are situated some of the world's most gigantic volcanic mountains, as, for example, Orizaba, altitude 18,250 feet, and Popocatepetl, with an elevation of 17,876 feet. A short distance west of the plateau is Colima, a very active volcano, which rises to a height of about 13,000 feet. Another noted Mexican volcano is Jorullo.

In the United States, Lassen peak, in California, is the only active volcano. The Cascade range has many volcanic peaks but only a few display signs of volcanic activity. Mt. Saint Helens and Mt. Baker, both in the state of Washington, are said to have been in eruption between 1840 and 1850. Mt. Hood, in Oregon, exhales volcanic vapors. Of volcanic origin also are Mt. Shasta and Mt. Rainier, which rank among the grandest peaks of the continent. In the Rocky mountains, there are but few volcanic peaks, but evidence of volcanic activity is very marked in the geysers and in other wonderful features of Yellowstone national park.

Alaska contains numerous volcanoes, some of which are very active. These are found along the coast ranges of southern Alaska and in the Aleutian islands. Among the more noted of the active or the recently active volcanoes on the mainland are Mt. Fairweather, Mt. Wrangell, and Mt. Katmai. The Aleutian volcanic belt is a narrow chain of islands extending westward from the Alaskan peninsula for a distance of more than 1500 miles. Some 25 of these islands contain one or more volcanoes, either active or only recently extinct. On Unimak island, near the southern mainland, is Mt. Shishaldin, with a symmetrical cone rivaling that of Fuji, Japan, in graceful contour.

Climate. In so vast a continent, extending through 75 degrees of latitude, great variations of climate naturally occur. In the far north, arctic severity rules, while in southern Mexico and Central America the climate is tropical. Most of the central portion of the continent has a temperate climate. However, a marked difference exists between the temperatures of parts of the Atlantic and of the Pacific coast having the same latitude. The climate of Washington or of Oregon, on the Pacific coast, is much milder than the climate of Maine or of Massachusetts, which are Atlantic coast states situated in nearly the same latitudes.

In July, a great inland area in North America becomes much warmer than the waters on the east and west coasts. Compared with the weather then prevailing on the oceans, the summer heat of eastern North America is excessive. Moreover, the winter cold is severer than in European countries of the same latitude. For example, in January, Labrador is 40° F. colder than northern Germany.

As the great interior plain has no mountain ranges crossing it, cold winds from the north sometimes sweep unimpeded far to the south, suddenly causing a fall of many degrees in temperature. Occasionally, these winds destroy early plantings or belated harvests as far south as Texas. In the plains region east of the Rocky mountains, a drop of 110° F. within 48 hours has been recorded. Such great changes of temperature are unknown on the Pacific coast. In the eastern part of the continent, quick changes of temperature occur, especially in winter, but are much less extreme than in the Great Plains region.

Rainfall. Along the Gulf coast from 50 inches to 55 inches of rain fall every year. At some points near the Gulf of Mexico, the annual rainfall exceeds 60 inches. A rainfall of 80 inches in a year is not uncommon in the Puget Sound region, and in some localities on the northern Pacific coast the annual precipitation is more than 100 inches. From Manitoba and central Kansas eastward the annual rainfall averages about 35 inches. On the high plains immediately east of the Rocky mountains, the rainfall seldom exceeds 20 inches annually. In Wyoming west of the Rockies and in Nevada, the rainfall is rarely more than 10 inches. Arizona and southern California contain limited areas which are practically rainless.

Minerals. In mineral wealth, North America leads all the other continents. Gold, silver, iron, copper, lead, zinc, nickel, coal, and other minerals are produced in immense quantities. The continent is the world's chief source of petroleum. Large quantities of natural gas occur in many widely separated regions.

Flora. The flora of the temperate regions of North America is remarkable for the great number of species of trees which it contains. Forests, whose acreage totals hundreds of millions, yield enormous quantities of hard and of soft wood timber. The lowland flora of the North American countries which lie south of the United States is characterized by a profusion of tropical flowers, vines, and trees. Mexican and Central American forests produce mahogany, rosewood, ebony, and other fine cabinet woods. The plant life of the Pacific coast region differs in a marked degree from that of the eastern

part of the continent. The pines, spruces, firs, and redwoods of the Pacific slope have no equals in size elsewhere in America. In bulk, the gigantic sequoias or "big trees" of California surpass all other known trees.

Fauna. Many of the animals native to North America closely resemble those found in the temperate parts of Europe and Asia. The bird fauna, for example, is strikingly similar. But the mocking bird, catbird, Baltimore oriole, wild turkey, turkey buzzard, bobolink, sage grouse, and various humming birds represent species found only in America. North America has various other distinctive animals which do not occur in the Old World. Among these are the American bison, popularly called buffalo, the grizzly bear, musk ox, bighorn sheep, Rocky Mountain goat, pronghorn, rattlesnake, Gila monster, and prairie dog.

GREENLAND

The largest island in the world, with the exception of Australia. The island lies northeast of Canada, from which it is separated by Baffin bay and Davis strait. It is almost wholly within the North Frigid Zone and stretches to a point within 450 miles of the north pole. Its estimated area is 840,000 square miles, and it has a maximum length north and south of 1400 miles, with a maximum width of 690 miles.

Physical Features. Greenland is bordered by a rocky shore rising abruptly several hundred feet above the water and cut by numerous deep fiords. The surface is a plateau having an average elevation of about 4500 feet but reaching, at a few points, an altitude of more than 10,000 feet. Spreading over about 85 per cent of the island's area is a covering of perpetual ice. This inland ice buries far below it all but the highest mountains, thereby affording an excellent example of such conditions as prevailed in the ice age. The ice constitutes a huge glacier flowing slowly toward the coasts. Each year it discharges into the ocean icebergs estimated to weigh in the aggregate more than one billion tons. The interior of Greenland contains one of the coldest areas on the globe, in which a temperature of 92° below zero has been recorded.

Area of Habitation. The southwest part of Greenland has a coastal strip which, in the summer, is covered with green lichens, trailing plants, and berries. The musk ox, white bear, wolf, arctic fox, and many varieties of birds subsist there.

This coastal strip was settled by Danes and is an integral part of the Commonwealth of Denmark. A large proportion of the 47,000 inhabitants are Eskimos, who although professing Christianity, still adhere to many of their pagan customs. The main occupations are fishing and hunting; whale oil, seal oil, skins, and eiderdown are exported. Greenland is the only source in the world of the mineral cryolite, or Greenland spar, used in making aluminum; lead, zinc, and wolfram are also mined.

Greenland was so named by Eric the Red, a Norseman who voyaged along the coast about 982 A. D. It was colonized by Scandinavians in the same century. Between 1410 and 1721, however, the island was neglected, and the European settlers disappeared, probably by intermarriage with the Eskimos. The present colony was planted in the 18th century. The capital is Godthaab, with a 1969 population of 3179.

HUDSON BAY

A large inland sea, situated in northeastern North America, and connected with the Atlantic Ocean by Hudson strait. From Fox channel, at the north, to the southern end of James bay, at the south, Hudson bay is about 1300 miles in length. In its main body, it is about 600 miles wide. It lies wholly within the Dominion of Canada, in a region of rigorous climate.

Area and Depth. The area of Hudson bay, estimated at 475,000 square miles, is about three times that of the Baltic Sea, and approximately half that of the Mediterranean. In its main portion, the bay varies in depth from 400 to 600 feet. The southern extension, called James bay, is very shallow except in the center.

Tides and Currents. On the extreme north, Hudson bay communicates with the Arctic Ocean through Fury and Hecla strait and the Gulf of Boothia. From this passage Hudson bay receives much arctic ice. In Fox channel the tide rises 40 feet, producing a strong current by which thick ice floes are driven southward into Hudson strait, where they menace navigation.

Character of Shores. The eastern shore, called the East Main, and the western shore north of Churchill are, for the most part, rocky and fringed with numerous small islands. The western shore is called the West Main. From Churchill southward it is low and flat. A low divide separates the drainage basin of Hudson bay from the two other great drainage basins of Canada, namely, the Mackenzie and the Saint Lawrence.

Tributary Rivers. The most important river system tributary to Hudson bay is the Nelson-Saskatchewan. Within this great drainage system lie the chief wheat producing areas of Manitoba, Saskatchewan, and Alberta. The system includes also the Red River of the North, which drains parts of North Dakota, South Dakota, and Minnesota, in the United States. This river flows north into Lake Winnipeg, the outlet of which is the Nelson river. The Nelson river empties its waters into Hudson bay at Port Nelson on the southwest coast.

Second in importance among tributaries is the Churchill river, which enters the bay at Churchill, about 125 miles northwest of Port Nelson. Its deep, capacious mouth forms the best harbor on the entire coast of Hudson bay. Among other affluents are the Albany river, on the southwest, flowing into James bay, and the Big, the Moose, and the Rupert river entering from the east shore. The total area of the Hudson Bay drainage basin is estimated at 1,486,000 square miles, or about one-half of the entire mainland of Canada.

Fisheries and Fur Trade. Hudson bay contains extensive and valuable fisheries. American whaling vessels often winter at Marble island in the northwest part of the bay, and the cod fisheries extend into Hudson strait. The Hudson's Bay Company has several stations, called factories, at various points on the coast. Of these, York Factory, at the mouth of Hayes river, is the leading trading post. For more than 200 years a cargo of valuable furs has been shipped annually from York Factory to England.

East and west of the northern part of Hudson bay are the Barren Grounds. These are dreary wastes where only stunted forms of vegetable life exist. But this desolate region is the feeding ground of caribou and musk oxen, and of various smaller animals hunted for their fur.

Commercial Importance. From Montreal and from Port Nelson the sailing distance to Liverpool is practically the same. Much of the grain produced in the Canadian Northwest is shipped to Montreal by way of Winnipeg and the Great Lakes. The distance from Winnipeg to Liverpool, by way of Port Nelson or Churchill, is more than 500 miles shorter than by way of Montreal. From Edmonton to Liverpool, by way of Hudson Bay ports, the distance is more than 1000 miles less than by way of Winnipeg and Montreal.

Other conditions being equal, it would be cheaper to export grain to Europe by way of Hudson bay. Wheat exports were begun over this route after the completion in 1929 of a railroad to Churchill. While neither Hudson bay nor Hudson strait is ever entirely frozen over, there is great danger to navigation from floating ice during the greater part of the year. For sailing ships, the season for safe navigation is from about July 15 to October 1.

THE GREAT LAKES

A chain of large fresh-water lakes, situated in the east central part of North America. They include lakes Superior, Huron, Michigan, Erie, and Ontario, and form a part of the boundary between the United States and Canada. None lies entirely within the territory of either country except Lake Michigan, which is situated wholly within the United States.

Area and Drainage Basin. The combined area of these lakes is about 94,600 square miles and constitutes the largest body of fresh water in the world. The land area in their drainage basins exceeds 185,000 square miles. No large river arising in the land flows into any of the Great Lakes; but the Saint Lawrence, the stream through which the system finally drains into the Atlantic, is one of the great rivers of the continent. The depressions occupied by the Great Lakes system are separated by low ridges from two other large drainage systems. One of these, lying on the north, drains into Hudson bay; the other, lying on the south and the west, drains through the Mississippi River system into the Gulf of Mexico.

Outlets and Connections. Lake Superior, situated at the head of the great chain, is the largest and deepest of the series. It empties through the Saint Marys river, 55 miles long, into Lake Huron. At Saint Marys rapids, called also Sault Sainte Marie, and the Soo, the river falls about 20 feet. The Sault Sainte Marie canals and locks, built on both the Canadian and the American side, permit deep-water navigation around these rapids. They form one of the most important artificial waterways in the world.

The outlet of Lake Michigan is the Strait of Mackinac, which empties into Lake Huron at a point near the mouth of the Saint Marys river. Lake Huron drains into Lake Erie through the Saint Clair river, 42 miles long; Saint Clair lake, 29 miles long; and the Detroit river, 28 miles long. Lake Erie empties into Lake Ontario through the Niagara river, 26 miles long. In its course between the two lakes, the Niagara river makes a descent of 326 feet, half of which occurs in one sheer drop at Niagara falls, the most noted of the world's great cataracts.

In order to establish navigation between Lake Erie and Lake Ontario, the Welland canal, 26 miles long, with an elaborate system of locks, was completed in 1833. This connected Port Colborne, on Lake Erie, with Port Dalhousie on Lake Ontario. Enlargements have transformed this early Canadian waterway into an important modern ship canal.

Lake Ontario drains through the Saint Lawrence river, about 750 miles long, into the Atlantic Ocean. In various rapids between the outlet of Lake Ontario and Montreal, the Saint Lawrence river descends nearly to sea level. As Lake Superior, with an altitude of 602 feet, is only 30 feet higher than Lake Erie, it will be seen that most of the descent to sea level is made in the Niagara and Saint Lawrence rivers between Buffalo and Montreal. Despite the rapids, the Saint Lawrence is navigable for downstream boats, including passenger steamers, but a series of canals has been constructed on the Canadian side to permit of upstream navigation.

The total length of the Great Lakes-Saint Lawrence water system is about 2200 miles. From Duluth to Buffalo the sailing distance is 997 miles; from Chicago to Buffalo, 929 miles; from Duluth to Ogdensburg, 1235 miles; and from Duluth to Montreal, 1350 miles.

Commercial Importance. In the industrial and commercial development of the eastern United States and Canada, the Great Lakes have been a factor of immense importance. For the early explorers, these lakes, with their river connections, furnished easy routes to the unknown interior. They also afforded avenues through which settlers reached the productive lands adjoining their waters. Later, these inland waterways provided efficient transportation of farm, forest, and mineral products throughout a vast region rich in natural resources. Thus the Great Lakes have contributed in a marked degree to the industrial supremacy of the United States. For example, the rapid development of the immense iron ore resources of the Lake Superior region was made possible by cheap water transportation.

From the times of the French-Canadian fur traders, with their flotillas of birch-bark canoes, the Great Lakes have been a water highway between eastern and western Canada. Down this waterway float much of Canada's huge surplus of wheat for export and also flour, iron, and lumber in vast quantities. In the opposite direction go coal and those manufactured articles for which the West exchanges its products with the East.

At Buffalo, on Lake Erie, is the western terminus of the New York State Barge canal. This gives the Great Lakes a very important connection with the seaboard by way of the Mohawk and the Hudson river to New York harbor. With no increase in capacity, the barge canal is capable of transporting every year millions of tons of grain and other staple products from the lake region to tidewater.

Magnitude of Lake Traffic. The total population of the eight American states and of the Canadian province bordering on the Great Lakes runs to scores of millions. The three largest inland cities of the New World are situated on their shores. In volume, the lake traffic is enormous. The tonnage passing annually through the Detroit river exceeds that which enters and clears in the foreign trade of both the Atlantic and the Pacific ports of the United States. The yearly traffic through the Sault Sainte Marie canal around Saint Marys falls is greater in point of tonnage than that of any other artificial waterway.

THE GREAT LAKES

Item	Superior	Michigan	Huron	Erie	Ontario

THE UNITED STATES

The United States, a Federal republic, occupies the central part of North America, and extends from the Atlantic Ocean to the Pacific and from Canada to Mexico. The area of the continental United States, including Alaska, almost equals the area of Europe. Besides Alaska, the republic possesses various island dependencies. See *Territorial Growth of the United States.*

Character of Coasts. In the northeast, the Atlantic shore is rugged and has numerous inlets, but south of New York bay the coast belt is flat, sandy, and in only a few places rises more than 100 feet above the sea. Numerous lagoons, reefs, keys, and sandbars render the Gulf coast dangerous to navigation. Most of the Pacific shore is bold and rocky, San Francisco bay and Puget sound being the only important indentations. On the northern border are the Great Lakes—Superior, Huron, Michigan, Erie, and Ontario.

U.S. COASTLINE BY CHIEF DIVISIONS

(In Statute Miles)

Surface Features. Dominant physical features of the republic are the Appalachian Mountain system along the Atlantic side with a lowland between the mountains and the ocean; the great Rocky Mountain system in the west, extending nearly north and south; and the vast valley between these highlands.

Other important physical features are the Sierra Nevada, the Cascade, and the Coast ranges, situated between the Rocky mountains and the Pacific Ocean; the vast desert area, called the Great Basin, lying between the Rockies and the Sierra Nevada; and the narrow fertile valleys, extending north and south, between the Sierra Nevada and the Coast ranges. Flanking the Great Basin on the east and the south are the lofty plateaus of Utah and Arizona. To the north of the Great Basin lies the less elevated Columbia River plateau.

Mountains and Plateaus. The high plateaus and mountain ranges of the western United States are a part of the great Cordilleran system which dominates the whole western side of North America. This system extends entirely across the United States from Mexico to Canada, through New Mexico, Colorado, Wyoming, and Montana, and throughout the region between these states and the Pacific Ocean. Measured from the eastern base of the Rockies, across Colorado, Utah, Nevada, and California, to the western base of the Coast ranges, the Cordilleran system is about 1000 miles in breadth.

The northern section of this western mountain region, particularly the Columbia River plateau, contains more extinct volcanoes than are found in any other equal area in the world. Here lavas, from ancient fissure eruptions, overspread an area of 200,000 square miles.

Scenery. The sublimity of the scenery of the western mountains is celebrated. The Yosemite falls of the Merced river in the Sierra Nevada are the highest in the world. In grandeur the Shoshone falls of the Snake river in southern Idaho rival Niagara. No Alpine lakes surpass Crater lake and Lake Tahoe in scenic beauty. The wonderlands of the globe, Yellowstone national park and Glacier park, are in the Rocky Mountain country. The Grand Canyon, nature's most marvelous example of erosion, traverses the high plateau of northwestern Arizona.

Mississippi Basin. The vast valley between the Rocky mountains and the Appalachians, called the Mississippi basin, is chiefly a grassy plain, mostly treeless, rising gently from the Gulf of Mexico toward Canada and also toward the highlands east and west. Through this basin the great Mississippi river, rising near the Canada border, flows southward into the Gulf of Mexico. In the south-central part of the valley is the only elevated section. This is the Ozark plateau, mostly from 800 feet to 1000 feet above the sea, but with summits in Arkansas which reach an elevation of 2800 feet.

About one-half the total area of the United States lies within the Mississippi basin. This basin, on account of the great fertility of its central and its eastern parts, is the most important agricultural region of the globe. Much of the western part, known as the Great Plains, with an elevation of 6000 feet in some places, has only a light rainfall. This region affords excellent natural pasturage, and, when irrigated, the soil is very productive.

Drainage Systems. The drainage waters of the United States find their way into the adjoining oceans chiefly through streams grouped in four general drainage systems, namely, the Atlantic, the Gulf, the Great Lakes, and the Pacific. Parts of North Dakota, South Dakota, and Minnesota, however, are drained by the Red River of the North, whose waters, joining those of the Nelson-Saskatchewan, flow into Hudson bay. Of the river systems, the Mississippi-Missouri, with numerous tributaries, is by far the largest. Other important large river systems are the Rio Grande, the Colorado and the Columbia.

Climate and Rainfall. Situated within the Temperate Zone, but covering a vast area having lowlands and highlands, the United States has many varieties of climate. In general, however, the climate is that which normally prevails in temperate regions, though subject to greater extremes than those which occur in Europe. Intense heat prevails in the southwest deserts in summer. In the northwest, in winter, the mercury falls below −40° F. But the dryness of the air in these regions renders endurable extremes of both heat and cold. Within the same degrees of latitude, the Pacific coast is much warmer than the Atlantic coast. Over the central and eastern portions of the country, the climate is continental.

HIGHEST AND LOWEST POINTS AND AVERAGE ELEVATION

United States and Possessions

State or Possession	Highest Point			Lowest Point			Mean Elevation (feet)
	Name	County	Elevation (feet)	Name	County	Elevation (feet)	
Alabama	Cheaha Mt.	Clay-Talladega	2,407	Gulf of Mexico		S. l.*	500
Alaska	Mt. McKinley		20,300	Pacific Ocean		S. l.	
Arizona	San Francisco Pk.	Coconino	12,611	Colorado River	Yuma	100	4,100
Arkansas	Blue Mountain / Magazine Mt.	Polk-Scott / Logan	2,800 / 2,800	Ouachita River	Ashley-Union	55	650
California	Mount Whitney	Inyo-Tulare	14,496	Death Valley	Inyo	−276†	2,900
Canal Zone	Cerro Galera	S. W. part of Zone	1,207	Pacific Ocean		S. l.	100
Colorado	Mount Elbert	Lake	14,420	Arkansas River	Prowers	3,350	6,800
Connecticut	Bear Mountain	Litchfield	2,355	Long Is. Sound		S. l.	500
Delaware	Centerville	New Castle	440	Atlantic Ocean		S. l.	60
Dist. Columbia	Tenleytown	Northwest part	420	Potomac River		S. l.	150
Florida	Iron Mountain	Polk	325	Atlantic Ocean		S. l.	100
Georgia	Brasstown Bald	Towns-Union	4,768	Atlantic Ocean		S. l.	600
Guam	Mt. Lamlan		1,334	Pacific Ocean		S. l.	
Hawaii	Mauna Kea	Hawaii	13,784	Pacific Ocean		S. l.	
Idaho	Borah Peak	Custer	12,655	Snake River	Nez Percé	720	5,000
Illinois	Charles Mound	Jo Daviess	1,241	Mississippi R.	Alexander	279	600
Indiana	Greensfork Tp.	Randolph	1,240	Ohio River	Vanderburg	316	700
Iowa	West boundary	Osceola	1,675	Mississippi R.	Lee	477	1,100
Kansas	West boundary	Wallace	4,135	Verdigris R.	Montgomery	700	2,000
Kentucky	Big Black Mt.	Harlan	4,150	Mississippi R.	Fulton	257	750
Louisiana	N. W. part of Co.	Claiborne	400	Gulf of Mexico		S. l.	100
Maine	Mt. Katahdin	Piscataquis	5,267	Atlantic Ocean		S. l.	600
Maryland	Backbone Mt.	Garrett	3,340	Atlantic Ocean		S. l.	350
Massachusetts	Mount Greylock	Berkshire	3,505	Atlantic Ocean		S. l.	500
Michigan	Porcupine Mts.	Ontonagon	2,023	Lake Erie		572	900
Minnesota	Mesabi Range	St. Louis	1,920	Lake Superior		602	1,200
Mississippi	Near Iuka	Tishomingo	780	Gulf of Mexico		S. l.	300
Missouri	Taum Sauk Mt.	Iron	1,800	St. Francis R.	Dunklin	230	800
Montana	Granite Peak	Park	12,850	Kootenai River	Flathead	1,800	3,400
Nebraska	S. W. part of Co.	Banner	5,300	S. E. part of Co.	Richardson	825	2,600
Nevada	Boundary Peak	Esmeralda	13,145	Colorado River	Clark	470	5,500

Utah	Kings Peaks	Duchesne	13,498	Beaverdam Crk.	Washington	2,000	6,100
Vermont	Mt. Mansfield	Lamoille	4,393	Lake Champlain	Franklin	95	1,000
Virginia	Mount Rogers	Grayson-Smyth	5,719	Atlantic Ocean		S. l.	950
Virgin Islands	Crown Hill	Is. of St. Thomas	1,550	Atlantic Ocean		S. l.	
Washington	Mt. Rainier	Pierce	14,408	Pacific Ocean		S. l.	1,700
West Virginia	Spruce Knob	Pendleton	4,860	Potomac River	Jefferson	240	1,500
Wisconsin	Rib Hill	Marathon	1,940	Lake Michigan		581	1,050
Wyoming	Gannett Peak	Fremont	13,785	Belle Fourche R.	Crook	3,100	6,700
United States	Mount McKinley		20,300	Death Valley	Inyo, Cal.	−276†	2,500

* Sea level. † Below sea level.

The rainfall varies greatly in different sections. The northwest Pacific coast and the Gulf coast have a heavy annual rainfall. In the central Mississippi valley the rainfall is ample for crop production. Around the Great Lakes the precipitation is moderate, but sufficient for agriculture. Tornadoes occur from the Great Plains eastward, but are most destructive in the lower Mississippi valley. Tropical hurricanes, sweeping northward from the Gulf of Mexico, sometimes cause serious damage along the coast from Texas to Florida.

Minerals. No other country in the world is so rich in minerals. Coal, iron ores, lead, zinc, silver, tungsten, gold, quicksilver, and copper are mined. Petroleum, natural gas, clays, cement, building stone, sulphur, lime, salt, slate, and other minerals are also produced in the United States. The mineral industry has developed with extraordinary rapidity. In 1870, the value of mineral products was about $200,000,000; in 1900, $1,109,000,000; in 1920, $6,981,000,000; in 1948, $27,830,000,000; in 1962, $18,834,000,000.

Vegetation. A wide range of climatic conditions, many different soils, and a surface diversified with mountains and valleys produce a varied vegetation. Plants characteristic of the North Temperate Zone are well represented, and there are also many species peculiar to the United States. Large forests are found in the extreme northwest and also in the southern, north central, and eastern states. It is estimated that there are at least 150 species of trees of industrial importance.

The central and eastern United States has many forests containing oaks, elms, maples, chestnuts, hickories, ashes, walnuts, and other well-known species. Characteristic trees of the South are pal-

mettoes, magnolias, tulip trees, sour gums, and yellow pines. Cypresses are abundant in the southern swamps. In the Great Lakes region, firs, pines, spruces, and larches abound. Pines, spruces, and junipers are common in the Rocky Mountain region and yuccas and cactuses in the southwestern deserts.

Cone-bearing trees attain their greatest development in the Pacific Coast region. Gigantic sequoias, believed to be the largest and the oldest of living plants, form groves in the Sierra Nevada. These remarkable trees are unknown elsewhere on the globe. Douglas firs, true firs, and various pines, cedars, hemlocks, and spruces also attain immense size, the Douglas fir and the sugar pine ranking with the sequoias among the great trees of the continent. There are many species of native grasses suitable for fattening live stock. Numerous kinds of berries, various species of nut trees, and hundreds of varieties of wild flowers are also found.

The original forests of the United States covered about 820 million acres and contained, it is estimated, over five trillion board feet of lumber. There remain now about 470 million acres of forested land, containing more than two trillion board feet. The annual growth of forest timber is only about one-sixth of the amount removed. The United States Bureau of Forestry is endeavoring to conserve the country's valuable timber resources and to grow new forests in suitable regions.

Animal Life. With the exception of arctic and tropical species, practically all the larger animals native to North America are found in the United States. Among grazing mammals now occurring wild are the moose, the wapiti or American elk, the bighorn, the Rocky Mountain goat, the pronghorn or American antelope, and various species of deer. Among native flesh-eating mammals are the black and the grizzly bear, the timber wolf, coyote, fox, puma, lynx, wolverene, raccoon, and cacomistle. Other interesting mammals are the beaver, porcupine, opossum, muskrat, woodchuck, badger, prairie dog, peccary, armadillo, numerous rabbits, hares, and squirrels, and various small fur-bearers, such as the skunk, mink, and ermine. The manatee or sea cow is found in Florida waters, and sea lions occur on the Pacific coast.

The birds are represented by several hundred species. Among game birds, the more highly prized are the partridge, sage hen, prairie hen, and other species of grouse; the mallard, teal, canvasback, and other kinds of ducks; the wild turkey, bobwhite, plumed quail, woodcock, and various kinds of geese, rails, plover, and snipe. Typical song birds are the robin, mockingbird, brown thrasher, wood thrush, bluebird, cardinal, goldfinch, and catbird; also several species of orioles, grosbeaks, and wrens. The birds of prey include the bald eagle (the American national emblem), the golden eagle, and numerous hawks, buzzards, owls, and vultures. Among birds of prey, the huge California vulture ranks second in size only to the condor of the Andes.

Of the large reptiles, the alligator is the best-known, though a true crocodile occurs in Florida. Numerous sea turtles, fresh-water terrapins, and land tortoises are found. The so-called horned toad, the chuckwalla, and the Gila monster are peculiar kinds of lizards inhabiting southwestern deserts. There are numerous species of snakes, but only the rattlesnakes, the copperhead, the water moccasin, and a few other species are venomous.

Both the coastal and the inland waters abound in fish. Cod, halibut, mackerel, bluefish, tuna, and many other valuable food fishes are taken in large quantities by the fisheries. Many inland streams teem with salmon, trout, shad, catfish, and sturgeon. In the larger lakes, various food fishes, such as whitefish, lake trout, ciscoes, bass, pike, and perch, occur in immense numbers. Along the north Atlantic coast, oysters and lobsters abound, the annual catch being one of the most valuable of American fisheries.

Manufacturing. In manufacturing, the United States surpasses all other countries. Immense natural resources—minerals, timber, water power, hydroelectric power—and an ample supply of skilled labor enable the republic to produce, year after year, a vast, varied, and increasing output of manufactures. In 1860, the total value of manufactures was less than 2 billion dollars; in 1963, it exceeded 150 billion dollars.

Commerce. The rapid development of the three great industries, mining, agriculture, and manufacturing, produced an equally rapid increase in railroad construction and also gave rise to an enormous foreign trade. The commerce of the United States is sure to increase to still greater dimensions because, in addition to its immense trade with countries in the temperate zones, the imports from tropical or subtropical countries are increasing. Rubber, tea, coffee, cacao, sugar, raw cotton, raw silk, tin, hides, nitrates, and gums come from countries lying within the Torrid Zone or near it. In 1860, the total foreign commerce of the U.S. was valued at about 700 million; in 1920, at about 13 billion; in 1960, over 20 billion; in 1970, over 42 billion; in 1975, over 106 billion.

GEOGRAPHICAL FACTS ABOUT THE UNITED STATES

The land area of the United States is 3,548,974 square miles.

The water area, exclusive of the Great Lakes, is 66,237 square miles.

The most northern point of conterminous United States is in Minnesota, latitude 49° 23′ N. and longitude 95° 9′ W.

The most southern point of conterminus United States is Cape Sable, Florida, latitude 25° 7′ N. and longitude 81° 5′ W. Hence Cape Sable is 49 miles farther south than the extreme southern point of Texas.

The most eastern point of the United States is West Quoddy Head, a Maine cape which projects into the Atlantic Ocean. This headland is in longitude 66° 57′ W. and latitude 44° 49′ N.

The most western point in conterminus U.S. is Cape Alava in Washington. This cape, which projects into the Pacific Ocean, is in longitude 124° 44′ W. and latitude 48° 10′ N.

The longest distance in a straight line from north to south is measured from the boundary between Canada and the United States, the 49th parallel of latitude, to the southernmost point of Texas—1598 miles.

The shortest distance from the Atlantic to the Pacific is a straight line drawn from a point near Charleston, South Carolina, to a point near San Diego, California. This distance is 2152 miles.

The longest distance in a straight line from the Atlantic to the Pacific is measured from West Quoddy Head to a point near Yaquina Head, an Oregon cape projecting into the Pacific Ocean. These points are 2807 miles apart.

The length of the boundary of the United States, as given by the United States Coast and Geodetic Survey, is 10,748 miles, divided as follows: Atlantic Ocean, 1883; Gulf of Mexico, 1639; Pacific Ocean, 1316; Mexico, 2013; Canada, 3897.

In the conterminus United States the temperature has fallen as low as 60° below zero in northern Montana and has risen as high as 134° in the shade in Death valley, California.

The annual rainfall on the north shore of the Gulf of Mexico exceeds 60 inches. Around Puget sound it reaches 100 inches. In the vicinity of the Great Lakes it ranges between 30 and 35 inches. At the eastern base of the Rocky mountains it is about 15 inches. In the deserts of the Great Basin it is usually less than 10 inches. At Yuma, in southwestern Arizona, it is only 3 inches.

The average yearly rainfall over all the continental United States equals 1300 cubic miles. This quantity of rain water would weigh six trillion tons.

The geographic center of the United States is a point 17 miles due west of Castle Rock, Butte county, South Dakota, approx. latitude 44° 58′ N., longitude 103° 46′ W.

The center of population in the United States in 1960 was at a point 50 mi. east of St. Louis, Mo., 6½ mi. northwest of Meridian Twp., Clinton Co., Ill. lat. 38° 35′ 58″N., long. 89° 12′ 35″ W., a movement of 57.0 mi. west and 16.5 mi. south since 1950.

The highest peak in the United States, including all territories, is the Alaskan mountain, Mt. McKinley, 20,300 feet.

The state having the lowest average elevation is Delaware. Its surface, if leveled, would be only 60 feet above the sea. Colorado has the highest average elevation, 6800 feet.

Name	Location	Area Sq. Mi.	Established	Distinctive Characteristics
Acadia	Maine Coast	65.05	1919	Mountains and coastal area on Mount Desert Island.
Big Bend	West Texas	1106.60	1944	Last great Texas wilderness, in bend of the Rio Grande.
Bryce Canyon	Southwestern Utah.	56.26	1928	Massive mountain uplift; magnificent forests; fantastically eroded pinnacles; extraordinary natural coloring.
Canyonlands	S. E. Utah	402.56	1964	Pinnacles, monoliths, deep gorges, rock formations.
Carlsbad Caverns	New Mexico	73.05	1930	Largest and deepest known cavern system.
Crater Lake	Southwestern Oregon	250.45	1902	Lake of extraordinary blue in crater of extinct volcano. No known inlet or outlet. Sidewalls 500 to 2000 feet high.
Everglades	Southern Florida	2188.33	1947	Part of the only subtropical area in the United States; vast forests, prairies, and watercourses; abundant bird life.
Glacier	Northwestern Montana	1582.86	1910	Mountain region, 250 glacier-fed lakes of romantic beauty, 60 glaciers. Precipices thousands of feet high. Trout fishing. With the adjoining Waterton Lakes national park of Canada.
Grand Canyon	North central Arizona	1052.46	1919	Greatest example of erosion and most wonderful scenic spectacle in the world. The stupendous gorge has average depth of about 1 mile and is from 4 to 18 miles wide.
Grand Teton	Wyoming.	484.92	1929	Picturesque mountains in a great "dude ranch" district.
Great Smoky Mountains	North Carolina and Tennessee	801.05	1930	Picturesque mountains, including about 40 peaks.
Guadalupe Mountains	Texas	30.68	1968	Diversified and beautiful scenery.
Haleakala	Maui Is., Hawaii	41.25	1961	Huge dormant volcano, 10,023 feet high, has one of the largest and most colorful craters known.
Hawaii Volcanoes	Hawaii Island	344.28	1916	Kilauea, Mauna Loa, largest active volcanoes in the world.
Hot Springs	Arkansas	1.61	1921	Forty-seven hot springs possessing curative properties.
Isle Royale	Lake Superior N. Michigan	842.73	1940	Extensive wilderness; habitat of one of the largest moose herds in America.
Kings Canyon	Middle eastern California	719.26	1940	Two canyons of the Kings River; mountain peaks to 14,000 feet; General Grant tree 40.3 feet in diameter.
Lassen Volcanic	Northern California	167.08	1916	Lassen Peak, 10,453 feet in altitude. Only recently active volcano in conterminous United States. Hot springs; mud geysers; ice caves; majestic canyons.
Mammoth Cave	S. W. Kentucky	80.24	1936	Large cavern including spectacular cave onyx formations.
Mesa Verde	S. W. Colorado	81.36	1906	Best preserved prehistoric cliff dwellings in United States.
Mount McKinley	S. C. Alaska	3030.45	1917	Highest mountain in North America (altitude 20,300 feet).
Mount Rainier	West central Washington.	378.09	1899	Forty-eight square miles of glacier, 50 to 500 feet thick. Immense fields of wild flowers.
Olympic	N. W. Washington	1400.94	1938	Finest remnant of the Pacific Northwest rain forest; numerous glaciers; feeding ground for rare Roosevelt elk.
Petrified Forest	Arizona	147.17	1962	Fossil tree trunks; colored rocks of Painted Desert.
Platt	So. Oklahoma	1.42	1906	Numerous well-known medicinal springs.
Rocky Mountain	North middle Colorado	409.88	1915	Heart of the Rockies; snow-topped range; peaks 11,000 to 14,255 feet high; sublime scenery.
Sequoia	California	604.47	1890	The Big Tree National Park; 12,000 sequoia trees ranging from 10 to 36 feet in diameter; towering mountain ranges; startling precipices.
Shenandoah	N. W. Virginia	331.72	1935	Region of scenic grandeur in the Blue Ridge mountains.
Virgin Islands	St. John Island	23.67	1956	White sand beaches and semi-tropical climate. Embraces scenery and plant life totally different from any other national park. Area covers two-thirds of St. John Island.
Wind Cave	South Dakota	43.84	1903	Cavern having miles of galleries and numerous chambers containing many peculiar geological formations.
Yellowstone	Wyoming, Montana, and Idaho	3471.52	1872	More geysers than in all rest of world; boiling springs; mud volcanoes; petrified forests; Grand Canyon of the Yellowstone; waterfalls; vast wilderness inhabited by deer, elk, bison, bear, mountain sheep, and other wild animals.
Yosemite	California	1188.99	1890	Valley of world famed beauty; lofty cliffs; romantic vistas; waterfalls of extraordinary height; many snow-crowned peaks; good trout fishing.
Zion	Southwestern Utah.	229.74	1919	Magnificent gorge(Zion canyon), depth from 1500 to 2500 feet, with precipitous walls of great beauty; picturesque scenery.

Parks and Monuments. Modern public parks and monuments have these principal purposes: To provide enjoyment to visitors; to safeguard the property so as to afford like enjoyment to future generations; and to make use of them as illustrations in spreading popular education in geography, science, and history.

In the United States, national parks differ from national monuments in that the parks require acts of Congress for their establishment, while monuments may also be established by executive order pursuant to the Antiquities Act of 1906. In general, the national parks are large areas of scenic magnificence, while the national monuments and related areas are, with a few exceptions, smaller and more often are primarily of historic or prehistoric interest. The states also, as well as many municipalities, have set aside millions of acres in all as parks or monuments.

Of other countries, Canada has the largest system of national and provincial parks. South Africa, Holland, Czechoslovakia, Italy, Kenya, and France also have at least one large area each for the preservation of natural scenery and of certain animals and plants. In fact, though not in name, Italy, France, and most other European countries have numerous public areas administered much like the American parks and monuments for the preservation of historic sites, such as Pompeii in Italy and Stonehenge in England.

The number of areas supervised by the U.S. National Park Service as reported on Jan. 1, 1966, was 214, with a total area of 26,548,693 acres. Of this number, 32 were national parks, 77 were national monuments, 23 were national historic sites or parks, 28 were national military or memorial parks, 12 were national battlefields, battlefield parks, or battlefield sites, and the rest were national seashores, recreation areas, cemeteries, parkways, and other areas.

The table above gives data about the national parks. On the two pages following appears a tabulation of national monuments and related areas, followed by a summary of state parks and related areas showing by states the number and acreage of such areas.

Name	Location	Area (Acres)	Established	Distinctive Characteristics
Abraham Lincoln Birthplace (*h*)	Kentucky	117	1916	Contains log cabin where Abraham Lincoln was born.
Andrew Johnson (*h*)	Tennessee	17	1942	Andrew Johnson's home, tailor shop, and grave.
Antietam (*b*)	Maryland	784	1890	Scene of one of the greatest battles of the Civil War.
Appomattox Court House (*h*)	Virginia	972	1940	Scene of the surrender of the Confederate Army, April 9, 1865.
Arches (*m*)	Utah	34,010	1929	Natural arches, windows, and other effects of wind erosion.
Arkansas Post (*m*)	Arkansas	221	1965	Earliest permanent white settlement in region.
Aztec Ruins (*m*)	N. Mex.	27	1923	Pueblo ruins, one containing 500 rooms.
Badlands (*m*)	S. Dakota	111,530	1939	Spectacular exhibit of erosion—fantastic ridges, cliffs.
Bandelier (*m*)	N. Mex.	29,661	1916	Vast ruins of prehistoric cliff dwellings.
Bent's Old Fort (*h*)	Colorado	178	1963	Fort built about 1833, trading post in fur trade.
Big Hole (*b*)	Montana	666	1910	Scene of victory, 1877, over force of Nez Perce Indians.
Black Canyon of the Gunnison (*m*)	Colorado	13,683	1933	10 miles of deepest and most scenic portion of Black Canyon.
Booker T. Washington (*m*)	Virginia	218	1957	Plantation on which Booker T. Washington was born.
Buck Island Reef (*m*)	Virgin Is.	850	1961	Marine garden with coral, grottoes, tropical fish.
Cabrillo (*m*)	California	81	1933	Memorial to discoverer of San Diego Bay in 1542.
Canyon de Chelly (*m*)	Arizona	83,840	1931	Deep canyon; Indian cliff dwellings; very ancient ruins.
Capitol Reef (*m*)	Utah	39,173	1937	Cliff dwellings, fossils, imprints of prehistoric animals.
Capulin Mountain (*m*)	N. Mex.	775	1916	Cinder cone of geologically recent formation.
Casa Grande Ruins (*m*)	Arizona	473	1889	Buildings of a prehistoric race. Ruins discovered in 1694.
Castillo de San Marcos (*m*)	Florida	22	1924	Oldest masonry fort in continental U.S.; built 1672.
Cedar Breaks (*m*)	Utah	6,155	1933	Spectacular canyons and cliffs of vivid coloring.
Chaco Canyon	N. Mex.	21,509	1907	Numerous ruins of cliff dwellings, including communal houses.
Chalmette (*h*)	Louisiana	136	1907	Scene of battle of New Orleans, Jaunary 8, 1815.
Channel Islands (*m*)	S. Calif.	18,167	1938	Parts of Anacapa and Santa Barbara Islands; fossil elephants.
Chesapeake & Ohio Canal (*m*)	Md.-W.Va.	4,475	1961	Old American canal with minimum alterations.
Chickamauga and Chattanooga (*b*)	Ga.-Tenn.	8,190	1890	Beautiful scenic park, embracing battlefields of Chickamauga, Missionary Ridge, and other conflicts of the Civil War, 1863.
Chiricahua (*m*)	Arizona	10,646	1924	Wilderness of unusual rock shapes.
Christiansted (*h*)	Virgin Is.	27	1952	Danish colonial government buildings.
City of Refuge (*h*)	Hawaii	182	1961	Until 1819, sanctuary for individuals fleeing death.
Colonial (*h*)	Virginia	9,430	1936	Jamestown, Williamsburg, Yorktown, connected by parkway.
Colorado (*m*)	Colo.	17,362	1911	Many lofty monoliths; unusual scenic beauty.
Coronado (*p*)	Arizona	2,834	1952	Commemorates Coronado's exploration in 1540–42.
Craters of the Moon (*m*)	Idaho	53,545	1924	Volcanic region with weird landscape effects.
Cumberland Gap (*h*)	Ky.-Tenn.-Va.	20,169	1955	Pass explored by Boone and used by western settlers.
Custer Battlefield (*m*)	Montana	765	1946	Site of Battle of the Little Bighorn River, June 25, 1876.
Death Valley (*m*)	Calif.-Nev.	†2,981	1933	Arid tract containing lowest point in the western hemisphere.
De Soto (*p*)	Florida	30	1949	Commemorates explorer's landing in 1539.
Devils Postpile (*m*)	Calif.	798	1911	Spectacular six-sided aggregation of basaltic columns.
Devils Tower (*m*)	Wyoming	1,347	1906	865-foot rock tower of volcanic origin. First national monument.
Dinosaur (*m*)	Utah-Col.	206,233	1915	Deposits of fossil animal remains of great scientific interest.
Edison (*h*)	N. Jersey	21	1955	Edison's home and laboratory.
Effigy Mounds (*m*)	Iowa	1,468	1949	Indian mounds in shape of animals.
El Morro (*m*)	N. Mex.	1,279	1906	Rock containing inscriptions cut by early Spanish explorers.
Fort Caroline (*p*)	Florida	120	1953	Overlooks site of French colony planted in 1564.
Fort Clatsop (*m*)	Oregon	125	1958	Winter campsite of Lewis and Clark.
Fort Davis (*h*)	Texas	460	1963	Fort to protect frontier and early settlers.
Fort Donelson (*p*)	Tennessee	600	1928	Site of Civil War fort.
Fort Frederica (*m*)	Georgia	250	1945	Built (1736–48) by Gen. James E. Oglethorpe.
Fort Jefferson (*m*)	Florida	47,125	1935	Largest all-masonry fort in Western world, built 1846.
Fort Laramie (*h*)	Wyoming	586	1938	Center for migrants and explorers 1834–90.
Fort Matanzas (*m*)	Florida	258	1924	Early Spanish stronghold.
Fort McHenry (*m*)	Maryland	43	1925	Defense of this fort on Sept. 13–14, 1814 inspired the composition of our national anthem.
Fort Necessity (*b*)	Pa.	500	1931	Scene of opening battle of French and Indian War.
Fort Pulaski (*m*)	Georgia	5,517	1924	Brick fort built 1829–47, bombarded in Civil War.
Fort Raleigh (*h*)	N. C.	160	1941	Site of "Lost Colony" settlement in 1585–87.
Fort Smith (*h*)	Arkansas	14	1964	Early military post in Louisiana Territory.
Fort Union (*m*)	N. Mex.	721	1956	Ruins of key fort in southwestern settlement.
Fort Vancouver (*h*)	Wash.	90	1961	Western Headquarters of Hudson's Bay Co. 1825–49.
Fredericksburg and Spotsylvania (*p*)	Virginia	3,672	1927	Portions of four great battlefields of Civil War.
George Washington Birthplace (*m*)	Virginia	394	1930	Memorial mansion and gardens.
Geo. Washington Carver	Missouri	210	1951	Site of cabin where he was born. Museum with relics and records.
Gettysburg (*p*)	Pa.	3,672	1895	Beautiful natural park. Scene of great Civil War combat, 1863.
Gila Cliff Dwellings (*m*)	N. Mex.	533	1907	Highly interesting remains of cliff dwellings.
Glacier Bay (*m*)	Alaska	†3,554	1925	Tidewater glaciers of first rank.
Grand Canyon (*m*)	Arizona	198,280	1932	Adjoins Grand Canyon Nat. Park.
Grand Portage (*m*)	Minnesota	770	1960	Exploration route, fur trading post of North West Co.
Gran Quivira (*m*)	N. Mex.	611	1909	Important relic of Spanish missions in the United States.
Great Sand Dunes (*m*)	Colorado	36,740	1932	Sand dune 1000 feet high in San Luis Valley.
Guilford Courthouse (*p*)	N. Car.	224	1917	Near Greensboro. Scene of great battle of the Revolution, 1781.
Hampton (*h*)	Maryland	45	1948	Historic 18th century mansion.
Harper's Ferry (*h*)	W.Va.-Md.	1500	1955	Site of John Brown's raid before Civil War.
Home of Franklin D. Roosevelt (*h*)	N. York	188	1945	Roosevelt residence and library at Hyde Park.
Homestead (*m*)	Nebraska	163	1939	Site of first homestead in the United States.
Hopewell Village (*h*)	Pa.	848	1938	17th-century center of iron making, ruins.
Horseshoe Bend (*p*)	Alabama	2,040	1959	Site of Jackson's victory over Indians.
Hovenweep (*m*)	Utah-Col.	505	1923	Groups of prehistoric towers and pueblo ruins.
Independence (*h*)	Penn.	22	1956	Philadelphia's Independence Hall and other structures.

NATIONAL MONUMENTS AND ALLIED AREAS*—Continued

Name	Location	Area (Acres)	Established	Distinctive Characteristics
Jefferson National Expansion Memorial (*h*)	Missouri	85	1935	Commemorating westward expansion of U.S.
Jewel Cave (*m*)	S. Dakota	1,275	1908	Vast limestone cavern of extraordinary beauty.
Joshua Tree (*m*)	Calif.	557,992	1936	The Joshua tree, a spectacular feature of western desert land.
Katmai (*m*)	Alaska	†4,215	1918	Volcanic phenomena; "Valley of Ten Thousand Smokes."
Kennesaw Mountain (*b*)	Georgia	3,683	1947	Scene of battle in Civil War, June 27, 1864.
King's Mountain (*p*)	S. Car.	3,950	1931	Site of American victory, Oct. 7, 1780, in Revolutionary War.
Lava Beds (*m*)	Calif.	46,239	1925	Volcanic formations; battleground Modoc Indian War, 1873.
Lehman Caves (*m*)	Nevada	640	1922	Limestone caverns of much beauty and scientific interest.
Lincoln Boyhood (*m*)	Indiana	200	1963	Farm where Lincoln lived from 8th to 21st year.
Lincoln Memorial (*m*)	D.C.	164	1911	Parthenon-like structure with colossal statue of seated Lincoln.
Manassas (*b*)	Virginia	3,109	1940	Scene of two Civil War battles in 1861 and 1862.
Minute Man (*h*)	Mass.	750	1959	Scene of opening skirmish of Revolutionary War.
Montezuma Castle (*m*)	Arizona	842	1906	Prehistoric cliff-dwelling in the face of a high cliff.
Moores Creek (*b*)	N. Car.	50	1926	Scene of a memorable battle of the Revolutionary War.
Morristown (*h*)	N. Jersey	958	1933	Washington's headquarters in 1779–80.
Mound City Group (*m*)	Ohio	68	1923	Prehistoric mounds in Camp Sheridan military reservation.
Mount Rushmore (*p*)	S. Dakota	1,278	1925	Colossal figures of four presidents carved on cliff.
Muir Woods (*m*)	Calif.	503	1908	Noted redwood grove; located 7 miles from San Francisco.
Natural Bridges (*m*)	Utah	7,600	1908	Three natural bridges, largest 222 feet high; span 261 feet.
Navajo (*m*)	Arizona	360	1909	Numerous ancient pueblos, or ruins of cliff dwellings.
Ocmulgee (*m*)	Georgia	683	1936	Indian mounds in and around Macon.
Oregon Caves (*m*)	Oregon	480	1909	Vast caves of dazzling whiteness called "Marble Halls."
Organ Pipe Cactus (*m*)	Arizona	330,874	1937	Unique forms of native plant and animal life.
Pea Ridge (*b*)	Arkansas	4,283	1960	Scene of Civil War battle in 1862.
Perry's Victory (*m*)	Ohio	21	1936	Commemoration of victory over British fleet in 1813.
Petersburg (*b*)	Virginia	2,731	1926	Scene of Civil War conflicts.
Pinnacles (*m*)	Calif.	14,498	1908	Many spirelike rock formations, 500 to 1200 feet high.
Pipe Spring (*m*)	Arizona	40	1923	Historic fort built by Mormon pioneers.
Pipestone (*m*)	Minnesota	283	1937	Source of material for Indian peace pipes.
Rainbow Bridge (*m*)	Utah	160	1910	Natural bridge 309 feet above water; span is 278 feet.
Richmond (*b*)	Virginia	747	1944	Scene of battles in defense of Richmond during Civil War.
Russell Cave (*m*)	Alabama	310	1961	Archeological record of human habitation from 6000 B.C.
Sagamore Hill (*h*)	New York	85	1963	Theodore Roosevelt's home from 1885 till his death.
Saguaro (*m*)	Arizona	78,644	1933	Giant cacti of unusual scientific interest.
Saint Gaudens (*h*)	N. H.	86	1965	"Aspet," home of sculptor Augustus St. Gaudens.
Salem Maritime (*h*)	Mass.	11	1938	Nathaniel Hawthorne's place in Salem.
San Juan (*h*)	P. Rico	38	1949	16th-century Spanish fortifications.
Saratoga (*h*)	New York	5,500	1948	Scene of American victory over British, 1777.
Scotts Bluff (*m*)	Nebraska	3,084	1919	Landmark on Oregon trail.
Shiloh (*b*)	Tenn.	3,515	1894	Embraces the battlefield of Shiloh, near Pittsburg Landing.
Sitka (*m*)	Alaska	54	1910	Park of great natural beauty, scene of massacre of Russians.
Statue of Liberty (*m*)	N.Y.-N.J.	58	1924	Famous statue on Liberty Island, gift of the French people.
Stones River (*b*)	Tennessee	331	1927	Scene of Civil War battle.
Sunset Crater (*m*)	Arizona	3,040	1930	Volcanic crater with lava flows and ice caves.
Theodore Roosevelt (*p*)	N. Dak.	70,436	1947	Part of Roosevelt's Elkhorn ranch.
Thomas Jefferson (*m*)	D. C.	18	1934	Colonnaded rotunda in style favored by Jefferson.
Timpanogos Cave (*m*)	Utah	250	1922	Limestone cavern almost 600 feet in length.
Tonto (*m*)	Arizona	1,120	1907	Cliff dwellings in an unusually good state of preservation.
Tumacacori (*m*)	Arizona	10	1908	Spanish Mission established in late 17th century.
Tuzigoot (*m*)	Arizona	43	1939	Ruins of ancient pueblo with valuable relics.
Vanderbilt Mansion (*h*)	New York	212	1940	Palatial residence at Hyde Park.
Vicksburg (*p*)	Miss.	1,741	1899	Scene of the siege and surrender of Vicksburg, 1863.
Walnut Canyon (*m*)	Arizona	1,879	1915	Cliff dwellings of much scientific and popular interest.
WashingtonMonument (*m*)	D. C.	106	1848	Obelisk, 555 feet high, commemorating George Washington.
White Sands (*m*)	N. Mex.	146,535	1933	Sands resembling snow; interesting plant and animal life.
Whitman Mission (*h*)	Wash.	98	1940	Site of first mission in Pacific Northwest.
Wilson's Creek (*b*)	Missouri	1730	1965	Civil War battlefield of 1861 for control of Missouri.
Wright Brothers (*p*)	N. Car.	425	1933	Scene of first sustained flight by airplane.
Wupatki (*m*)	Arizona	35,233	1924	Prehistoric dwellings of ancestors of Hopi Indians.
Yucca House (*m*)	Colo.	10	1919	Mounds left by prehistoric people.

* Exclusive of areas less than 5 acres. † Square miles. (*b*) National military parks or national battlefields, battlefield sites, or battlefield parks. (*h*) National historical parks or national historic sites. (*m*) National monuments. (*p*) National memorials or national memorial parks.

NEW ENGLAND STATES

The New England states, comprising Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut, are situated in the northeastern part of the United States. The total area of these six states, 66,608 square miles, is less than the area of Oklahoma, 69,919 square miles, while the total population, 11,699,726, is more than four times the population of that state, 2,498,378.

Surface. The principal upland regions of New England are the old, worn-down White mountains in New Hampshire, the Green mountains in Vermont, and the Berkshire Hills in Massachusetts. Numerous harbors, formed from submerged valleys, indent the coast. Northern New England has many small lakes noted for scenic beauty. The Rangeley lakes in Maine and lakes Sunapee and Winnepesaukee in New Hampshire are popular resorts.

Rivers. New England is well watered. Many of the rivers are broken by falls or rapids, and some of these furnish hydroelectric power. The Connecticut, Penobscot, Kennebec, Mystic, Charles, and Thames are navigable for steamers.

Climate. The climate is continental. Winter, a very cold season, is rendered more unpleasant by the humidity of the air. Northeast winds passing over the cold Labrador current flowing along the New England shore are chilled and, blowing inland, bring heavy snows in winter and cause fogs and cold rains in summer. The southeast winds are much milder, as they sweep over warm ocean currents from the Gulf of Mexico.

Minerals. New England has but little mineral wealth. Building stones, feldspars, and various clays are found. Granite, basalt, marble, and slate are the chief quarry products, and rank in importance in the order named. Among these states, Vermont stands first in total value of quarry products, with Massachusetts second, and New Hampshire third. Besides leading in the production of granite, Vermont quarries large quantities of slate and much beautiful marble. In each of the New England states, except Connecticut in which basalt leads, granite is the most valuable quarry product.

Fisheries. Fishing early became a prominent industry, the nearness of rich fishing grounds attracting a large class of workers. Cod, halibut, mackerel, swordfish, haddock, hake, herring, and pollock are the principal catches. Oysters, clams, crabs, lobsters, and shrimps form important items in the total annual value of the fisheries. Menhaden are taken in immense quantities for oil and fertilizing material. In amount and value of sea fish taken, Massachusetts leads all other states in the Union.

Forests. Forests still cover large tracts of land in this section, especially in Maine, New Hampshire, and Vermont. The pine is the most common tree

Spruce is cut in Maine for making paper and wood pulp, the principal manufactures of the state. Maine still ships considerable lumber.

Agriculture. Much of New England is stony and difficult to cultivate, and abandoned farms are not uncommon. The Connecticut valley, however, has very fertile soil, and there is also considerable good farm land in the valleys of several smaller rivers. Hay is the chief crop. Potatoes, rye, corn, and oats are also raised. Connecticut Valley tobacco ranks second only to Cuban tobacco. Dairying is an important occupation, especially in Vermont. Market gardening is a profitable industry in recent years. Apples, pears, and cherries are the chief orchard fruits. More than half the world's supply of cranberries is grown in Massachusetts.

Manufacturing. In all these states, manufacturing is the principal occupation. Hundreds of different articles are made. Among the chief products are metal wares, boots and shoes, leather, paper, brass goods, machinery, electrical apparatus, clothing, rubber goods, barbed wire, carpets, and refined sugar. Although many textile mills have moved to the South, textiles are still important to the economy of New England. Every city in this division is a manufacturing center.

Many western states have counties each larger than southern New England. This section lacks coal, iron, copper, lead, zinc, timber, wool, cotton, hides—in short, all the basic materials of industrial work in mill, factory, or machine shop. Yet the intelligence, skill, energy, and inventiveness of its people have made southern New England the greatest center of diversified manufacturing in the Union. Massachusetts is a striking example. Forty-three states exceed it in area. Yet in population it stands ninth among the states, and its enormous manufacturing output gives it still higher rank in commerce.

Commerce. The seaboard states have a large commerce, both domestic and foreign, and the harbors of their important ports are crowded with shipping at all times of the year. Manufactures constitute the bulk of the exports; the imports consist mainly of raw materials from various parts of the globe. Numerous railroads link this section with the rest of the Union. The principal ports are Boston, Mass., Portland, Me., Providence, R. I., Portsmouth, N. H., and New Haven, Conn.

MIDDLE ATLANTIC STATES

Because of their medial position with reference to the seaboard, and on account of a general similarity in surface features, the states of New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, and West Virginia are generally grouped together. The first four have been called the "Middle" states and the last three have been placed with "South Atlantic" or "Southern" states. By some, the first three are styled "Middle Atlantic" while all the others are called "South Atlantic" states.

The total area of the states comprising this group is less than one-sixteenth of the entire area of the country. Yet these seven states have about one-fourth of the population, own more than one-third of the manufacturing capital, and contain nearly two-fifths of the wage earners of the United States.

Surface. The Appalachian Mountain system extends across this group of states from northeast to southwest, and the coastal plain gradually widens southward. On the west side of the mountains is the Allegheny plateau. It is a rugged area, sloping toward the Mississippi, and is but thinly populated. Numerous bays and inlets indent the Atlantic Coast and several of them form excellent harbors.

The coastal plain is low and sandy, and much of it is bordered by swamps. Some of the rivers are navigable and add greatly to the transportation facilities of the region. Among the more important tidal streams are the Hudson, the Delaware, the Patapsco, and the James. The Ohio River on the west is a great artery of interstate trade. The shores of Chesapeake Bay are dotted with ports actively engaged in coastwise traffic.

Climate. Between the northern and southern limits of this division the distance is nearly 600 miles. This distance, together with variations in surface features, causes marked differences in the climatic conditions of the northern and southern parts. In northern New York the mean winter temperature is 17° F.; in southern Virginia, 35° F. The summer temperature averages 60° F. along the northern boundary of this group of states and 75° F. along the southern. The fruit belt of western New York owes its favorable climate to the equalizing influence of Lake Erie and Lake Ontario. The Gulf Stream passes near the Virginia coast and moderates the winds blowing from the ocean. In all the states of this division the rainfall is amply sufficient for farming.

Mining. Iron is found in all the states except Delaware. Enormous quantities of coal are mined in Pennsylvania, West Virginia, Maryland, and Virginia. Petroleum, first discovered in Pennsylvania in 1859, is produced in that state, in New York, and in West Virginia. Natural gas, piped from the gas fields, is utilized for heating and lighting in many cities.

Their vast supplies of coal, iron, petroleum, and natural gas, the basic materials of industrial wealth, have enabled these states to lead the nation in various steel and iron manufactures.

Forests. Northern New York is well forested, and much forest land in the Adirondack region is under the protection of the state. In the Appalachians, the United States government has reserved extensive forested tracts. Hemlock is the principal timber cut in New York and Pennsylvania. Spruce for making wood pulp is obtained chiefly in New York and in West Virginia. Oak, maple, poplar, walnut, and other broad-leaved trees are common in all these states. Yellow pine is an important source of lumber in Virginia, and cypress and cedar are found in the coastal swamps. Hardwoods produced in this group come mostly from West Virginia.

Agriculture. In these states, agriculture has always been an important industry. There is much fertile soil, and large crops of grains, potatoes, apples, peaches, pears, grapes, and strawberries are grown. Virginia ranks as one of the leading tobacco states. Peanuts also form an important crop in that state. Buckwheat is grown extensively in Pennsylvania and in New York. Peas, corn, tomatoes, berries, and orchard fruits are canned in enormous quantities. Market gardening is a profitable occupation near the large centers of population. Much attention is paid to dairying, especially in New York. The annual output of butter and cheese is very large. Vast quantities of milk are supplied to the great cities in this section. Besides cattle, the other large farm animals most commonly reared are horses, sheep, and hogs. Poultry raising is an important industry.

Fisheries. Fishing is an occupation of great importance. Oysters form the most valuable single item. Shad, bluefish, and mackerel are taken in the bays and rivers. Lakes Erie and Ontario furnish large quantities of lake trout, pike, ciscoes, and other food fish.

Manufacturing. In this section manufacturing is the foremost industry. New York, called the Empire State, ranks first in the Union in manufacturing as well as in population, wealth, and commerce. Of its long list of diversified manufactures, the most valuable single industrial product is wearing apparel. Other important manufactures of this division of states are iron and steel wares, foundry and machine shop products, chemicals, woolen goods, silk, glass, and leather goods. Oil refining is the leading industry in New Jersey.

Commerce. The commercial supremacy of this group of states arises from favoring geographic conditions and from abundant transportation facili-

ties. Two-thirds of the foreign commerce of the United States passes through New York, Philadelphia, Baltimore, and other ports of this division. Unsurpassed facilities for collecting raw materials and for distributing manufactured goods account for the growth of the larger industrial cities. Equal facilities for gathering and for distributing exports have made several cities great seaports.

The Great Lakes aid the growth of the Middle Atlantic states by furnishing a waterway for transporting raw materials needed in many industries. Of high value also are the Hudson and Mohawk valleys. These furnish easy routes of rail, river, and canal communication between the Atlantic seaboard and the West. The New York State Barge canal connects the Hudson river with the Great Lakes. The Allegheny and Monongahela rivers, uniting to form the Ohio, afford water transportation between this group of states and the central and southern parts of the United States.

CENTRAL STATES

The large division of the Union called the Central states consists of Kentucky, Ohio, Indiana, Illinois, Michigan, Wisconsin, Missouri, Iowa, Minnesota, North Dakota, South Dakota, Nebraska, and Kansas.

Surface. Prairies occupy a large part of this division. They are level or gently rolling and for the most part are covered with a rich dark soil. On such plains modern farm machinery can be used to great advantage; hence the central and eastern parts have become the chief agricultural regions of the United States.

Along the western border there is considerable highland, including the Black Hills, noted for their gold mines. In the southwest corner of South Dakota are the famous Bad Lands. These consist of a maze of ridges and pinnacles of sandstone; the soil is mostly bare clay of different colors, and the whole region is very difficult of travel.

Rivers. Most of this division is drained by the Mississippi and its affluents. Six of the states, however, border on the Great Lakes and are in part in the Saint Lawrence basin. Some streams in Minnesota, North Dakota, and South Dakota flow into the Red River of the North. Hence the waters of the Central states find their way into the Atlantic through the Gulf of Mexico, the Saint Lawrence gulf, and Hudson bay. Besides the hundreds of streams that water this vast valley, there are thousands of small lakes that dot the surface, especially in Minnesota and in North Dakota. The principal rivers navigable by steamboats are the Mississippi, Missouri, Ohio, Wabash, Illinois, and Red River of the North.

Climate. In the north, the winter is long and extremely cold weather prevails, while the summers are short and hot. Along the southern border, in Kentucky, Missouri, and Kansas, the climate is milder. Snow seldom falls there and never stays on the ground long. The rainfall is sufficient for farming over all this division, except in the extreme western plains.

Minerals. This group of states is very rich in mineral wealth. Coal is mined extensively in Kentucky, Iowa, Indiana, Ohio, Kansas, and Illinois, the last ranking third among the coal producing states of the Union. Petroleum wells are in operation in Kentucky, Indiana, Kansas, and Illinois. Natural gas is produced in several states, notably in Illinois and Indiana. Gold, silver, lead, zinc, potter's clays, building stone, gypsum, asbestos, and graphite are obtained. Michigan has long been noted for its yield of copper and salt. In Minnesota and Michigan there are vast deposits of iron ore. Because of this supply, made available by cheap transportation, great centers of the iron industry have been developed on lakes Michigan and Erie.

Forests. Michigan, Wisconsin, and Minnesota, once leaders in the cutting of timber, are still important producers of lumber and pulp wood. Pine for lumber and spruce and hemlock for pulp wood are the principal items in the annual timber cut. Despite the destruction of the chief forests, large woodlands still exist in several of the states, and forest industries furnish employment for many workers.

Agriculture. Every crop known to the temperate zones can be grown in this division. Hundreds of millions of bushels of corn, oats, barley, rye, and wheat are raised annually. Hay, potatoes, vegetables, and orchard fruits are important crops. Tobacco is cultivated in the eastern part of this division. Kentucky is one of the leading states in the Union in tobacco production. Sugar beets are grown in ten states in this group; Nebraska, Michigan, and Minnesota lead in sugar beet production. Flax is grown in the northwest. No other section of equal area on the globe rivals the central Mississippi valley in agricultural productiveness. Even on the higher western plains, abundant harvests are reaped wherever the land is irrigated.

Live Stock. Cattle, horses, mules, and hogs (fattened on corn) are raised in immense numbers. Sheep are reared in every state, and the annual wool clip totals about one-third of that of the entire United States. Dairy interests, already very large, are becoming increasingly valuable. Butter, cheese, and condensed milk from this division now go to all parts of the civilized world. Poultry farming is a profitable occupation.

Manufacturing. The range in manufacturing is exceedingly extensive. In several states the manufactures surpass in value the farm products. More automobiles are made in this division than in all the rest of the world. Meat packing is so vast an industry that it influences prices in every city in the United States. Much of the world's supply of flour is milled in these states.

The iron and steel interests, concentrated in centers of industry in northern Ohio, Indiana, and Illinois, employ many thousands of workers. The yearly output of refined petroleum represents many millions of dollars. Glass, furniture, wearing apparel, foundry and machine shop products, pottery, lumber, agricultural implements, tobacco goods, chemicals, metal wares, farm machinery, boots and shoes, beet sugar, paints and varnishes are other products whose aggregate output is enormous.

Fisheries. The Great Lakes supply annually over 100 million pounds of fish. Whitefish, ciscoes or lake herring, and lake trout constitute the principal catch. The frozen fish industry has become extensive.

Commerce. The states in this division have excellent railway facilities. Within their borders are operated more than 100,000 miles of railways, or about two-fifths of the entire railway mileage of the United States. The Ohio river and the Mississippi river are important arteries of commerce. Fleets of steamers, handling an enormous tonnage, ply on the Great Lakes. In connection with the lake traffic, the New York State Barge canal is used to transport various raw materials to the Hudson river, which serves as the final link in an all-water connection with the seaboard. But by far the larger part of the foreign shipments reach the great eastern seaports, New York, Boston, Philadelphia, and Baltimore, by railroad.

SOUTHERN STATES

Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, and Texas comprise the Southern states.

This division of the Union is bounded on the north by the Middle Atlantic states and by the Central states; on the east by the Atlantic Ocean; on the south by the Gulf of Mexico and Mexico; and on the west by New Mexico. The shortest distance between the extreme eastern and western limits is about 1700 miles. The width from north to south varies from about 425 to 850 miles. The total area of these eleven states is 781,657 square miles, or more than one-fourth of the area of the continental United States. For convenience of reference this division is treated in two sections—an eastern section and a western.

EASTERN SECTION

North Carolina, South Carolina, Tennessee, Georgia, Florida, Alabama, and Mississippi constitute the eastern section of the Southern states.

Surface. The Appalachian Mountain system, occupying much of this section and broadening out in the north, reaches its highest point in Mt. Mitchell, 6684 feet high, in North Carolina. Southward the mountains diminish in height until, in Alabama, they become low hills. All Florida and Mississippi, and parts of North Carolina, South Carolina, Georgia, and Alabama, are in the coastal plain. The principal rivers, including the Mississippi, Savannah, Saint John's, and Cape Fear, are navigable for steamers.

Climate and Rainfall. Along the Gulf coast, a region of heavy rains, the temperature averages about 85° F. in summer and 50° F. in winter. On the Atlantic shore, the climate is almost as warm, though not so humid. The climate of the upland districts is cool and bracing. Flowers bloom the year round in the more southern section, and the mildness of the climate draws numerous visitors to the winter resorts along both the Atlantic and the Gulf coast. From 40 inches to 60 inches of rain a year falls in the seaboard districts.

Minerals. Coal and iron ore are mined in Tennessee and Alabama, and mica in North Carolina Georgia and Tennessee produce excellent marble. Granite, limestone, and sandstone are abundant. Florida has large deposits of phosphate rock. In all these states there are numerous beds of potter's clay and other minor minerals.

Forests. Forests overspread thousands of square miles, the trees including yellow pine, cypress, hickory, ash, maple, and other hardwoods. In size and variety of species the forest trees of this section exceed those of all other parts of the Union, except the Pacific states. Lumbering is an important industry in many sections.

Agriculture. The chief occupation is farming. All the crops of the Temperate Zone can be grown in these states. Cotton is the most valuable single crop. Sea-island cotton is grown along the Atlantic coast. Millions of acres are devoted to corn and tobacco. Oats, white potatoes, peanuts, sweet potatoes, hay, wheat, and fruits are also widely cultivated. Rice is raised in the coast belt. Apples, plums, pears, watermelons, strawberries, peaches, and grapes grow in abundance. Southern Florida produces pineapples, figs, oranges, grapefruit, avocados, guavas, and other subtropical fruits. Garden vegetables are grown extensively for northern markets. Strawberries are shipped north every spring by fast-freight trains. Similarly, oranges, grapefruit, and various vegetables are sent in winter. Georgia leads in the production of pecans.

Fisheries. Oysters are obtained along the Atlantic shore. Bluefish, mullet, shad, mackerel, kingfish, tarpon, and other sea fish are caught. Valuable fisheries, including sponge fishing, are established on the Florida coast.

Stock Raising. Hogs, horses, mules, sheep, and cattle are raised in every state. Dairying has become an important industry. Milk, butter, and cheese are produced in large quantities.

Manufacturing. Manufacturing is developing rapidly in this section. Among the important industrial products are cotton textiles, cottonseed oil, cottonseed cake, lumber, iron and steel, tobacco goods, and naval stores. Cigars and cigarettes are made in great quantities in North Carolina and in Florida. Cotton goods form the leading industrial product. North Carolina leads all other states of the Union in cotton manufacturing. Flour milling and woodworking are valuable industrial interests. Iron and steel products are made in Tennessee and in Alabama. Aluminum is produced in Tennessee and North Carolina. The canning of fruits and vegetables is a growing industry in all these states. In this group, North Carolina, Georgia, and Tennessee lead in manufactures in the order named. Among important industrial centers are Atlanta, Ga., Birmingham, Ala., Winston-Salem, N. C., Memphis, Tenn., and Nashville, Tenn.

Commerce. Much merchandise for export is shipped down the Mississippi to New Orleans, where it is transferred to seagoing vessels. Portions of other rivers are utilized to some extent as inland waterways. Cotton is the largest export of this section. Pine lumber, phosphate rock, and naval stores are also sent abroad in large quantities. There are ample facilities for transportation by rail to all parts of the Union. The principal seaports serving these states are Wilmington, N. C., Charleston, S. C., Savannah, Ga., Jacksonville, Fla., Tampa, Fla., Pensacola, Fla., Mobile, Ala., and New Orleans, La.

WESTERN SECTION

Arkansas, Louisiana, Texas, and Oklahoma form the western section of the Southern states.

Surface. The northeastern part of this section is included in the Ozark plateau. This upland extends into the northern part of Arkansas and into the eastern part of Oklahoma. Louisiana and southeastern Texas lie in the coastal plain. The elevated western parts of Texas and Oklahoma form the southern extension of the Great Plains. The principal rivers are the Mississippi, Red, Brazos, Sabine, Trinity, and Colorado. All these drain into the Gulf of Mexico.

Climate and Rainfall. An abundant rainfall occurs over the eastern and southern parts of this section, while on the western side, which is mostly an elevated plain, the rainfall seldom exceeds 20 inches annually. The extreme southwest is dry. The summers are long and hot, but the Gulf winds lower the temperature, and winter is a pleasant season.

Agriculture. Agriculture is the chief source of wealth. Rich soil and favorable climate make it possible to grow in this section any crop of the Temperate Zone. Cotton is the principal crop. Other important products are rice, corn, potatoes, sweet potatoes, hay, wheat, tobacco, and numerous fruits. Vegetables are grown in enormous quantities for the northern markets. Louisiana is the leading state in sugar production. Texas is a large producer in several lines of agriculture. It is easily the first state in cotton. Texas also leads all the other states in value of crops produced. These frequently approximate a billion dollars in total value.

Lumbering. There are great forests of pine and cypress in the coastal plain and immense forests of hardwoods in high lands in the interior. This section is one of the chief timber regions of the country. Louisiana is the second state in the Union in lumber production.

Minerals. Sulphur mining is important in Louisiana and Texas. These states now furnish the

world's chief supply of sulphur. Bauxite, the most valuable ore of aluminum, is obtained in Arkansas. In Oklahoma, Texas, and Louisiana, immense quantities of petroleum and natural gas are found. The Oklahoma oil field yields a very substantial proportion of the annual output of the petroleum of the United States. Beds of rock salt are worked in both Louisiana and Texas. Oklahoma is one of the leading states of the Union in zinc production and a considerable amount of lead also is obtained there. Manganese, potter's clay, quicksilver, coal, and copper are other valuable minerals obtained in this section. Building stone is abundant in all the states.

Stock Raising. The farm animals reared in this section bring enormous sums annually. Texas is the chief cattle raising state. Mules, horses, hogs, and sheep also are raised in great numbers. Texas ranks as one of the foremost wool producing states. The wool clip of Texas normally exceeds 25 million pounds annually.

Manufacturing. The principal manufactures of this section are petroleum products, lumber, refined sugar, packed meats, flour, cottonseed oil, and cottonseed cake. The manufacture of ice and of textiles are growing industries. Louisiana leads the group in the refining of cane sugar and in rice polishing, rice and sugar cane being distinctive crops of that state. Oklahoma ranks highest in the production of flour. Texas leads in manufactures, and is followed by Louisiana, Oklahoma, and Arkansas in the order named.

Commerce. The eastern part of the section has ample transportation facilities, and the thinly populated western section is crossed by numerous railways. Railroads connect all the commercial centers with the large cities east and north, and the rivers furnish hundreds of miles of waterways navigable for steamboats. The chief seaports are New Orleans, La., and Galveston, Houston, and Port Arthur, Texas. Important inland cities are Little Rock, Ark., Shreveport, La., Oklahoma City and Tulsa, Okla., Dallas, Fort Worth, San Antonio, and El Paso, Texas.

PLATEAU STATES

The Plateau states division of the Union is composed of Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, and Wyoming. These states cover more than 850,000 square miles, or more than one-fourth of the total area of the United States. Idaho, the smallest state in the group, is larger than all the New England states combined.

Surface. This division embraces most of the region occupied by the Rocky Mountain system in the continental United States. The surface is mainly a series of plateaus surmounted by lofty ranges, which attain their greatest height in Colorado. The mean or average elevation of the Plateau states is approximately 5300 feet, or slightly more than one mile, above sea level. Colorado and Wyoming have the highest average elevation; Montana and Arizona, the lowest. In all of the states there are mountains which rise above 12,000 feet. Peaks more than 13,000 feet high are found in Nevada, New Mexico, Utah, and Wyoming. In Colorado, many summits rise above 14,000 feet.

In geological times this vast upland was a scene of tremendous volcanic action. There are many extinct volcanoes, and ancient lava beds cover many thousand square miles. The great geysers of Yellowstone park are situated in a volcanic region.

Rivers. The Plateau states are drained chiefly by streams belonging to two great drainage systems, the Gulf and the Pacific. Important rivers whose waters reach the Gulf of Mexico are the Rio Grande, the Arkansas, the Platte, the Yellowstone, and the Missouri. The principal rivers whose waters finally flow into the Pacific are the Colorado, Green, Grand, Snake, and Clark Fork. The Green and the Grand are affluents of the Colorado; the Snake and Clark Fork are tributaries of the Columbia.

The streams of the Great Basin, a very dry region comprising much of western Utah and nearly all of Nevada, usually flow only during the brief rainy season. They either disappear in sandy valleys or discharge their scanty waters into alkaline lakes having no outlet. The Humboldt, the largest river in Nevada, flows nearly across the state from east to west. It empties into the Humboldt and the Carson sinks where its waters evaporate, leaving alkaline deposits. Similarly, the Sevier river, the longest stream in western Utah, flows into the salty Sevier lake. The Weber, the Bear, and the Jordan are small rivers which empty into Great Salt lake.

Climate. Because of a wide range in latitude, great variations in altitude, and marked diversity of surface features, the Plateau states have many varieties of climate. On the highest mountains, arctic conditions prevail. In the elevated plains at the base of the mountains there are severe extremes of heat and cold. In the far southwest are some of the hottest desert areas known.

The widest extremes of temperature are observed on the high plains of Montana, flanking the eastern base of the Rockies. Here temperatures ranging from about 60° below zero in winter to 108° above zero in summer have been noted. In southwestern Arizona, near the Mexican border, summer temperatures of 120° have been recorded, but in winter the thermometer rarely falls below freezing. The climate of the various interior parts of the Plateau states is similar, but with less pronounced extremes.

A noteworthy feature of the climate of the plateau region is the great daily variation in temperature which takes place, especially in summer. No matter how warm the days, the nights are almost invariably cool, even in the hottest deserts.

Strong winds, which prevail in many sections, often exercise a marked influence on the climate. A well-known example is the so-called chinook, a warm wind which, sweeping down the eastern slope of the Rockies and far out on the adjacent plains, sometimes melts heavy snowfalls within a few hours.

Notwithstanding severe extremes, the climate of the Plateau states is dry and invigorating, and, on the whole, unusually salubrious.

Rainfall. On one-fifth of the United States the rainfall is so light that agriculture cannot be successfully carried on without irrigation. Most of the dry area is in this division. Because of scanty rainfall, all these states have tracts of true desert. Thousands of square miles also are covered with alkali deposits. These dreary wastes have often no vegetation whatever. In other sections, the traveler may ride for hours over dusty plains, with yuccas, cactuses, greasewoods, or sagebrushes the only conspicuous plants in sight. These require but very little moisture.

Forests. In all of the Plateau states, forests are found on the slopes of the mountains. The trees are generally pines, spruces, firs, and other conifers. About one-sixth of the total area is more or less wooded. In each state there are large forested districts under government protection. These reserves, some 90 in all, are known as national forests. Their total area, about 140,000 square miles, is greater than that of any state in the group except Montana. Among the Plateau states, Idaho, with over 30,000 square miles of protected woodlands, has the greatest area in national forests. Montana ranks second, with Colorado, Arizona, Wyoming, New Mexico, and Utah following in the order named. Nevada, with reserves of 7780 square miles, ranks last. See *Forests, U. S. National.*

Minerals. The Plateau states are exceedingly rich in mineral wealth. Among important mineral productions are gold, silver, copper, coal, petroleum, lead, tungsten, uranium, vanadium, gems, and

precious stones. In gold production, Colorado, Utah, and Arizona rank highest in the group. Utah, Montana, and Idaho are the chief producers of silver in the United States. In copper production, Arizona stands first, while Utah and Montana also rank among the most important copper producing states of the Union. Colorado, Wyoming, Utah, and New Mexico have valuable coal deposits. Wyoming contains rich petroleum fields. Colorado is the world's chief source of molybdenum, and Nevada and Colorado stand first in the production of tungsten.

Agriculture. Dry farming is successfully practiced in some districts, but dependence is placed chiefly upon irrigated land. This will grow most of the standard crops of the temperate zones. Wheat, barley, oats, potatoes, and sugar beets are raised. Alfalfa is a highly profitable crop, several harvests being reaped in a year. Truck farm products, as Colorado and Arizona melons, bring high prices in eastern markets. Apple culture has become a valuable pursuit in Montana and Idaho. Peaches are grown in Colorado and Utah. In the southwest, the hot climate fosters the growth of dates, olives, figs, oranges, and other subtropical fruits. Egyptian or long-staple cotton has become a leading crop in Arizona.

Government irrigation work has already reclaimed millions of acres of arid land. Farms of irrigated soil are small, and intensive agriculture is practiced. Improved land in farms comprises about one-twentieth of the total area. Montana has the largest acreage of crop land, Colorado stands second, and Idaho is third.

Stock Raising. For many years, stock raising has been an important industry in this division, and much capital is invested in the rearing of cattle, sheep, and horses. These rank in value in the order named. The annual wool clip of these states amounts to about two-fifths of that of the entire United States. Native grasses afford excellent pasturage, and, in the southern and central parts, farm animals feed in the open all the year round. Large numbers of cattle are sent to Omaha, Kansas City, Chicago, and other meat packing centers, where they are slaughtered, the meat being packed and distributed largely in refrigerator cars.

Manufacturing. Copper, lead, refined ores, flour, beet sugar, butter, condensed milk, dressed meat, canned vegetables, railroad cars, foundry materials, and lumber are the principal industrial products of the Plateau states. Manufacturing to supply local needs is increasing. Immense water power is available for future development. Colorado stands first among these states in value of manufactures; Montana is second, Utah third, and Arizona fourth.

Commerce. Railroads afford ready transportation to all parts of the Union. Several transcontinental lines cross this section, and there are numerous local lines. Mine products, lumber, cattle, cotton, and fruits form the chief items of outgoing shipment. These are sent both to the East and to the West chiefly in exchange for manufactures and other staples which the plateau region does not as yet produce.

PACIFIC STATES—CONTIGUOUS

The Pacific States consist of (1) the three continental States of California, Oregon, and Washington and (2) the off-shore states of Alaska and Hawaii. The geography of the three continental Pacific states will be treated here as a unit, as with the preceding regions of continental United States. But since Alaska and Hawaii are separate geographic areas, each of them will be treated separately.

Surface. No other equal area in the continental United States displays such diversity in surface features as does this division. In its mountain ranges are found the highest peaks, and in its deserts occur the lowest depressions. The rivers plunge down from alpine valleys over the highest known waterfalls. Here also is the only active volcano in the country.

The Sierra Nevada range extends nearly north and south through eastern California and, under the name of the Cascade range, continues northward through Oregon and Washington. Near the Pacific shore, the Coast ranges traverse these states from north to south. Between the Sierra Nevada and the Coast ranges lies the great central valley of California. This is about 50 miles wide and 400 miles long and is remarkably fertile. In the southern part, irrigation is needed for successful farming. Farther north are the Columbia, Willamette, and Puget Sound valleys, all having soil of great fertility.

The extensive region lying east of the Sierra Nevada and the Cascades is mostly a barren desert. An exception is the fertile district situated between the Columbia and Snake rivers. A highland, largely of volcanic origin, known as the Columbia River plateau, occupies much of eastern Oregon and Washington. Parts of California adjacent to Nevada form the western rim of the Great Basin. East of the southernmost extensions of the Sierra Nevada and bordering on Arizona are the Mojave desert and the Colorado desert. On the Pacific side of the Sierra Madre, San Bernardino, and other ranges that form the western borders of these deserts, lies the valley of southern California, a coastal plain of remarkable productiveness under irrigation.

Rivers. The Columbia, which rises in Canada, is the only large navigable river in the Pacific states. Together with its tributaries, the most important of which are the Snake and the Willamette, the Columbia drains the greater part of Oregon and Washington. Next in importance are the Sacramento and the San Joaquin. The lower portions of each of these streams are navigable. These two rivers, with their affluents, drain the great central valley of California. There are numerous smaller streams, many of which are broken by rapids or falls. Some of these furnish hydroelectric power. Numerous streams supply water for mining and for irrigation purposes.

Climate. The great length of this division and its intersection by several mountain ranges result in many varieties of climate. These range from the very wet to the very dry, and from the arctic cold of high mountain tops to the torrid heat of California's southeastern deserts. Owing to the moderating influence of winds from the ocean, a mild climate prevails along the entire Pacific shore. This coastal climate ranges from subtropical and dry in southern California to temperate and moist in the Puget Sound region.

Rainfall. In western Washington, the rainfall over the valleys averages 65 inches a year and, in the mountain districts, reaches 100 inches. Western Oregon also has a heavy rainfall. But in the eastern sections of both states less than 20 inches of rain falls annually. In parts of the Colorado desert near the Arizona boundary, the average yearly rainfall is less than three inches.

Summer is a dry season in this division, and the winters are wet. In summer, trays of fruits are left outdoors, day and night, to dry, the drying period often lasting several weeks. Abundant rain falls in northern California, but, in the southern part of the state, irrigation is essential for crop raising.

Minerals. Gold was discovered in California in 1848, and since then the state has yielded every year millions of dollars worth of this precious metal. Though gold is now mined in several other states, California still leads in gold production.

At least 50 other minerals of high commercial value are found in this division. Among them are silver, lead, copper, bismuth, manganese, quicksilver, tungsten, chromium, zinc, magnesite, lithium, and arsenic. The southeastern deserts of California contain immense deposits of borax. Coal of good quality is mined in Washington. Building stone is quarried in all the states. But the most important product is petroleum. California's output of petroleum exceeds in value the yield of all her mines.

* The information herein given has been derived from the Statistical Abstract of the United States and other authoritative sources. For various items satisfactory statistics covering some dates are unavailable. In such cases the spaces are marked with leaders, thus. . . . . In other cases, such as petroleum, the telephone, or beet sugar, in which the subject in question had not yet been discovered, invented, or brought to substantial production or use, the space corresponding to the date is left blank. The statistics of manufactures from 1880 to 1940, inclusive, are those of the Federal census, but, in each case, the figures are those of the preceding year, 1879, 1889, 1899, 1909, 1919, 1929, and 1939. The same applies to agricultural production.

* The information herein given has been derived from the Statistical Abstract of the United States and other authoritative sources. For various items satisfactory statistics covering some dates are unavailable. In such cases the spaces are marked with leaders, thus . . . . In other cases, such as petroleum, the telephone, or beet sugar, in which the subject in question had not yet been discovered, invented, or brought to substantial production or use, the space corresponding to the date is left blank. The statistics of manufactures from 1880 to 1940, inclusive, are those of the Federal census, but, in each case, the figures are those of the preceding year, 1879, 1889, 1899, 1909, 1919, 1929. The same applies to agricultural production.

Forests. The coniferous forests of these states are the noblest in the world. In variety of species, in yield of merchantable timber, and in size, age, and beauty of trees, they are unsurpassed. Oregon and western Washington constitute the most important lumber region in the United States.

The heavy rainfall of the coast districts promotes forest growth. West of the Cascades the Douglas fir attains immense size. In dense, nearly pure forests, this tree covers large areas, and furnishes more than half of the available timber. Large spruces, cedars, and hemlocks also abound. East of the Cascades, western yellow pine and sugar pine are valuable timber trees, the former ranking second in importance to the Douglas fir.

The redwood, a magnificent conifer of the northern California coast, supplies excellent building material. Along the western slopes of the Sierra Nevada there are groves of giant sequoias, the most ancient and massive trees known. Many species of broad-leaved or deciduous trees are found, but native hard woods are of minor importance. In the plains districts of California, various species of eucalyptus provide quick timber and shade.

Agriculture and Horticulture. Farming is the chief industry in these states. Because of wide diversity in soil and climate, a greater variety of agricultural products is grown than in any other equal area in the United States.

In most of the large valleys of Washington, western Oregon, and north central California, sufficient rain falls to insure good harvests. In southern California and in the more arid parts of Oregon and Washington, irrigation is necessary. Among the principal crops are wheat, barley, oats, hay, alfalfa, potatoes, sugar beets, cotton, rice, beans, corn, and numerous fruits and vegetables. In total value the fruits outrank all the other agricultural products of this division. Next to fruits, wheat is the most important single crop, ranking first in value of all crops in Washington, second in Oregon, and third in California. Among hay and fodder crops, alfalfa leads. Although unsuited to the climate, corn, the great staple of the Central states, is grown to a limited extent.

California's great wheat ranches are disappearing, but intensive agriculture, especially fruit growing in connection with irrigation, is making notable progress. All of the Pacific states are famous for their fruits. Apples grown in the Hood River valley in Oregon and in the Yakima district in Washington command high prices in eastern markets Along the Willamette River thousands of acres are planted with apple, peach, pear, and plum trees. In western Oregon, loganberry culture is an extensive industry.

California ranks as the foremost fruit producing state in the Union. Contrary to general opinion in the eastern states, most of this state's great fruit harvest consists of the orchard and vineyard fruits of temperate latitudes,—apples, apricots, cherries, grapes, peaches, pears, plums, and prunes. The best varieties of the European grape flourish, and large quantities of grape juice and raisins are produced. The growing of citrus fruits is a large industry in southern California. From its extensive groves thousands of carloads of oranges, lemons, and grapefruit are shipped to the eastern states every year. Almonds, figs, olives, English walnuts, and melons are grown in large quantities. Among less common fruits whose cultivation has been established in California are the avocado, cherimoya, date, and feijoa.

Irrigation. By irrigation many arid areas in these states have been turned into highly productive lands. A half century ago southern California was mostly a dreary waste. Much that was then desert is now covered with groves of oranges and other fruits, or with fields of grain, alfalfa, melons, or cotton. In no other part of the United States is irrigation so extensively established or devoted to the production of such an immense variety of crops. California leads all the states of the Union in acreage under irrigation and in value of crops produced on irrigated land.

Animal Industry. Large areas in the drier sections are devoted to the raising of cattle and sheep. About one-sixth of the entire wool clip of the United States is produced in the Pacific states. Dairying is a profitable industry. Poultry raising is important, and in some localities, as at Petaluma, California, it has become highly specialized. In the production of honey California usually leads all the other states.

Fisheries. Salmon is the most valuable fish. Puget Sound and the Columbia River are the principal salmon fishing grounds. Millions of pounds of salmon are canned every year and exported to all parts of the world. Fresh salmon are also shipped in refrigerator cars to all the large cities of the Union. Halibut, tuna, herring, and other valuable food fish are taken along the Pacific coast.

Manufacturing. In the contiguous Pacific states, manufacturing ranks second to agriculture in importance. Among the chief manufactures are lumber, canned fruits, refined petroleum, flour, packed meats, and dairy products. Other important products of manufacture are refined sugar, canned fish, and mining machinery.

Manufacturing has been greatly stimulated by the extensive development of hydroelectric power, especially in California and Washington. Particularly since 1910, this factor has been one of rapidly increasing importance in the industry of the Pacific Coast. In southern California many factories use crude petroleum for fuel. Lumber, flour, slaughtering and meat packing, and paper and wood pulp are the leading products of manufacture in Washington; lumber and flour lead in Oregon; and petroleum products, canned fruits, and meat products rank in the order named in California. In total value of manufactures, California stands ninth among the states of the Union.

Commerce. The Pacific contiguous states occupy a position of great commercial advantage. They have fine harbors on the Pacific Ocean and an immense hinterland whose products of farm, forest, and mine are increasing every year. A great trade is carried on through Puget Sound ports. The Panama Canal has brought Europe and the Atlantic states much nearer to this division and thereby stimulated its commerce with those older manufacturing parts of the world. Since 1910 the trade of these states with Japan, the Philippines, Hawaii, New Zealand, Australia, and South America has made a marked gain.

PACIFIC STATES—NONCONTIGUOUS

The noncontiguous, or off-shore, Pacific states of Alaska and Hawaii are treated below in two separate articles. Both admitted into the Union in 1959, they are the only states situated outside of the mainland.

ALASKA

Alaska, the largest state of the United States, situated in the extreme northwestern part of North America. All of it lies to the north and to the west of the United States. Its northernmost point is about 1450 miles farther north than its southernmost point. From its easternmost point to its westernmost point, Alaska extends through a distance greater than that from New York to San Francisco.

Area and Location. Alaska embraces three distinct regions—the main territory, the panhandle, or southeastern Alaska, and the Aleutian Islands.

The main territory comprises all of continental North America lying west of the 141st meridian of

west longitude. It is bounded on the east by Canada, on the north by the Arctic Ocean, on the west by the Arctic Ocean, Bering Strait, and Bering Sea, and on the south by the Pacific Ocean and the Gulf of Alaska. The panhandle of southeastern Alaska consists of a narrow fringe of mainland and various islands along the coast, between British Columbia and the Pacific Ocean, extending from Cape Muzon and the Portland Canal, at the extreme south, northward to Mount Saint Elias, where the panhandle joins the main territory.

The Aleutian Islands extend westward from the southwestern part of the main territory, as far as, and including, Attu, off the coast of Asia. Various islands in Bering Sea near the American mainland, including the Pribilof and the Saint Lawrence islands, also belong to Alaska.

The area of Alaska, about 590,000 square miles, is nearly one-fifth that of the "lower 48" states, or more than twice the size of Texas. The coast line of mainland Alaska has a total length of 6542 miles, measured along the tidal shore in units of 3 statute miles. The coast lines of all Alaska's islands measure 8590 miles. These two figures together, 15,132 miles, exceed the general tidal coast line of all the rest of the United States, including Hawaii.

Surface. There are four distinct natural surface divisions in the mainland of Alaska. From south to north, these are the Pacific Mountain system, the Central Plateau region, the Rocky Mountain system, and the Arctic Slope region.

The Pacific Mountain system comprises the Coast, the Mount Saint Elias, the Aleutian, and the Alaska ranges. These form great barrier walls along and near the southern shores. This rugged highland contains the loftiest mountains of the continent, culminating in Mount McKinley, in the Alaska range, the highest peak in North America.

East and north of these majestic ranges is the great central plateau, drained chiefly by the Yukon River. This plateau extends entirely across Alaska from east to west. North of it, the Rocky Mountain system, locally called the Brooks Range, which crosses the international boundary about 100 miles north of the Arctic Circle, extends westerly across Alaska nearly to the Arctic Ocean. North of the Rockies is the Arctic Slope, a barren, featureless, coastal plain.

For about 1000 miles southwestward from the Alaska peninsula extends the Aleutian archipelago which consists of about 70 treeless islands and numerous islets, mostly uninhabited.

Volcanoes. The Aleutian range, in the Alaska peninsula, contains a group of active volcanoes, which, in some respects, are the most remarkable in the world. The eruption of Katmai in this group, in 1912, was one of the most violent volcanic outbursts recorded in modern times. Katmai and its vicinity, including the famous "Valley of Ten Thousand Smokes," have been made a national monument. Aniakchak and Veniamin, with craters 21 and 20 miles in circumference respectively, rank first among active volcanoes in size of their vents.

Glaciers. The mountains bordering on the Gulf of Alaska are covered with perpetual snow. From their slopes, immense glaciers, which increase in size from Glacier Bay northward, extend down to the sea. On the shores between Glacier Bay and Kenai peninsula are found nine-tenths of the permanent ice fields on the mainland of the continent. Here are some 25 active glaciers which discharge their slowly flowing ice into the sea. Among the most noted is the Muir glacier, which has a seaward face 3 miles wide and 300 feet high. The greatest example of all is the Malaspina glacier, 1200 square miles in extent, which rests on the southern slope of Mount Saint Elias and reaches the ocean at Icy cape.

The Muir glacier has recently attracted much scientific attention because of its rapid recession due to melting. This has aroused speculation as to whether the world's climate is gradually becoming warmer.

This great glacier was first visited by John Muir in 1880 and has been named in honor of him. Net recession since then has been almost two miles with parts of the ice mass which melted having been nearly one-half mile thick. The formerly great central ice stream is all melted leaving now 12 separate glacial streams. This is reputed to be the best area in the world for study of glacial phenomena.

Rivers. The chief river in Alaska is the Yukon, the largest American river emptying into the Pacific Ocean. This magnificent river, some 2300 miles long, is formed by the confluence of streams having their headwaters in British Columbia. It flows northward in Yukon territory, and, about midway on the international boundary, enters Alaska. At the northernmost point in its bow-shaped course of about 1500 miles from the Canada boundary to Bering Sea, the Yukon swings slightly north of the Arctic Circle. Its chief tributaries are the Tanana, the Porcupine, and the Koyukuk. Other important Alaskan rivers are the Kuskokwim, the Copper, Matanuska, Kenai, Nushagak, Kobuk, Noatak, Colville, Stikine, Taku, and the Susitna.

Scenery. Alaska, with its great mountains, volcanoes, glaciers, and rivers, is noted for the magnificence of its scenery. The Portland Canal, Chatham strait, and the Lynn Canal, in southeastern Alaska, surrounded by snow-capped mountains rising above immense forests, rank among the finest scenic waterways in the world. Around the Gulf of Alaska, the coast is indented with deep bays resembling the noted fiords of Norway and which likewise include magnificent glaciers. The Taku glacier is only a few miles from the steamer track of the famous inside passage and can be seen from the largest ocean steamers that ply Alaskan waters. Mount McKinley national park, which includes the great mountain, affords some of the grandest mountain views on the continent.

Climate. According to the U. S. Weather Bureau, Alaska is climatically divided into 4 areas—(1) a maritime zone that includes southeastern Alaska, the south coast, and southwestern islands, (2) a transition zone between marine and continental influences (mostly a very narrow band along the southern portion of the Copper River and the northern extreme of the south coast—specifically the Chugach Mountains, Cook Inlet, Bristol Bay, and the coastal regions of west-central Alaska), (3) a continental zone made up of the remainders of the Copper River and west-central Alaska and the interior region, and (4) an arctic zone.

In the maritime zone a coastal mountain range coupled with plentiful moisture produces annual precipitation amounts up to 200 inches in the southeastern panhandle, and up to 150 inches along the northern coast of the Gulf of Alaska. Amounts taper to near 60 inches on the southern side of the Alaska Range in the peninsula and Aleutian Island sections. Precipitation amounts decrease rapidly to the north, with an average of 12 inches in the continental zone and less than 6 inches in the Arctic region.

Snowfall makes up a large portion of the total annual precipitation. For example, Yakutat averages 216 inches of snow annually, and has a total annual precipitation (rain plus water equivalent of snow) of about 130 inches. Along the Arctic slope, Barrow receives an average of 29 inches of snow annually and a total annual precipitation of slightly more than 4 inches. Total snow depths on the ground are controlled by the temperature of an area. Fortunately, most of the areas of heavy snow have relatively mild temperatures which prevent total depths from becoming excessive. The greatest annual precipitation occurred at Little Port Walter (in southeastern Alaska) in 1943, with a total of 269.30 inches. Snowfall extremes are all credited to one station, located at Thompson Pass.

Mean annual temperatures in Alaska range from

the low 40's under the maritime influence in the south to a chilly 10 degrees along the Arctic Slope north of the Brooks Mountain Range. The greatest seasonal temperature contrast between seasons is found in the central and eastern portion of the continental interior. In this area summer heating produces average maximum temperatures in the upper 70's with extreme readings in the 90's. The highest recorded temperature for the state, 100 degrees, occurred at Fort Yukon in June of 1915. In winter the lack of sunshine permits radiation to lower temperatures to the minus 50's and occasionally colder for two or three weeks at a time. Average winter minimums in this area are 20 to 30 degrees below zero. The coldest temperature ever recorded in Alaska was minus 76 degrees at Tanana in January of 1886. In Barrow, Alaska's northernmost town in the frigid arctic region, January temperatures average −18°F. Its minimum, −56°F is higher than at Fairbanks and points inland, due to its open coastal location. The sun circles the sky in Barrow without setting for about 2 months in summer and the Arctic night is also about 2 months in length.

Winter temperatures play a principal role in the flow of most of Alaska's rivers. Several cease to flow completely during the coldest months, generally from late October to early May.

Vegetation. The southern coastal region is heavily forested and contains much valuable timber, chiefly Sitka spruce and hemlock. The Tongass national forest comprises southeastern Alaska, and the Chugatch national forest extends from Controller bay to Cook inlet. Extensive forests of spruce and tamarack, interspersed with poplar, aspen, white birch, and alder, occur along numerous watercourses in the Yukon valley. These forests total nearly 21 million acres with practically all under National Forest Service Administration. In the remaining portions of Alaska, there are but few trees. The Alaska peninsula and the Aleutian islands are grasslands. These grasslands are composed of highly nutritious grasses and are available as pasturage the year round. Cattle and horses released on these areas have grown fat and sleek without attention from man.

The coastal region of Bering Sea and the Arctic Ocean is covered with tundra. The tundra furnishes very desirable pasturage for caribou, reindeer, and musk ox.

Animal Life. Alaska is rich in animal life, especially in game animals, fur bearing animals, and in food fishes. Among the larger land animals are moose, caribou, deer, bighorn, and mountain goat. There are also several species of bear, including the polar bear, the rare glacial bear, and the great Kodiak bear. The reindeer, introduced from Siberia to provide food for the native Indians and Eskimos, now abounds in great herds. It is reared like cattle, and reindeer meat is an article of export to the United States. In the coastal waters are found the walrus, the hair seal, and various whales. The fur bearing animals include the fur seal, sea otter, beaver, ermine, mink, marten, and wolverine. Salmon, cod, halibut, and herring are immensely abundant in Alaskan waters.

Minerals. Alaska possesses vast mineral resources, many of which are undeveloped. The most important mineral products are gold, oil, copper, and coal. Many other valuable metals and minerals are found, among which are silver, lead, antimony, tin, oil, tungsten, platinum, quicksilver, and marble.

Gold has been found chiefly in the Juneau district, the Copper River district, the Yukon valley, and in the Seward peninsula, or Nome region. Gold was first discovered in Alaska in 1861. The gold rush started in 1883, reached its peak about 1887, and experienced a resurgence in 1896. Gold mined in Alaska from 1880 until 1930 is valued at approximately $380 million. Annual production is in the neighborhood of $5 million.

The decline in gold production was accompanied by a rise in the production of other minerals. The mining of copper, found in the coast region from Mount Saint Elias to Cook inlet, began in 1902 and soon surpassed gold in value of output. Copper exceeded all other mineral production until 1962, when it was surpassed by the production of petroleum. Alaska ranks eighth among the states of the Union in the production of oil, with the potential to rank higher. Alaska has sold leases to bidders, giving various companies oil exploratory rights to specified territory, for some $862 million, plus 12½% royalty tax and 4% severance tax on every barrel of oil taken out. The development of the oil industry in Alaska has been slow, with two wells now in operation, one at Prudhoe Bay, and the other at Snag River. The most attractive areas for drilling for oil are adjacent to the Pacific Ocean on the south and the Arctic Ocean on the north. Some of the most desirable areas, however, are not available for drilling or exploratory drilling.

Extensive coal fields are found in widely separated districts from southern Alaska to the Arctic coast. It is estimated that more than 12,000 square miles

ALASKA

are underlaid with coal deposits ranging in quality from anthracite to lignite. Silver and lead are also produced in significant quantities. Practically all the tin mined in North America comes from Alaska. Other mineral products include platinum, mercury, and marble. Natural gas, discovered in 1949, is marketed extensively.

Transportation. The development of Alaska's immense resources depends upon the establishment of quick and cheap transportation. The coasts have many good harbors, and the Yukon and other rivers provide some 3000 miles of inland waterways. But the water routes are long, are open only in summer, and do not reach some of the most important districts. Short railways have been built in connection with mining enterprises, but they were not constructed as correlated parts of a railway system designed to serve the needs of the whole territory.

The United States government has, however, completed a railway, some 470 miles long, from Seward, on the Gulf of Alaska, to Fairbanks, at the head of deep water navigation on the Tanana river, chief tributary of the Yukon. This connects the southern coast with the interior valley.

The Alaska Highway, originally called the Alcan Highway, was built by American army engineers for the defense of Alaska in 1942. It extends from Daw-

son Creek, British Columbia, to Fairbanks, Alaska, a distance of 1523 miles. Open to the public since 1948, tourist services are available along its entire length. Lodging and meal service are good and moderate in cost. Gasoline is available but as yet relatively costly. Autos may now make the round trip overland to Fairbanks; but a tourist seeking variety may drive from Fairbanks to Anchorage or Seward and take a boat over the attractive ocean route to Seattle.

Numerous airports have facilitated rapid transit to otherwise inaccessible points. There are 15 certified carriers and 50 or more irregular carriers. There are also 153 territorial fields. Outposts such as Nome are finding the quick connection by planes much more dependable and desirable than dog teams, which are costly to maintain, requiring constant feed and care.

Alaskans have been referred to as "the flyingest" of all Americans. The description is justified, not only on a per capita mileage basis for citizens of the 49th state, but also for the daring exploits of "bush pilots," who are not daunted by unfavorable weather or difficult terrain. Increasingly, this local use of air transportation is being matched by communication with distant points. Several Federal airports are maintained, and four air lines provide regularly scheduled service between Alaska and the other states.

Commerce and Industry. The industries of Alaska are chiefly in connection with mining, fisheries, and the fur trade, with a limited amount of lumbering. The dominant tree of the commercial timber type is western hemlock, with Sitka spruce a close second. Western red cedar and Alaska yellow cedar are produced to some extent. Local uses of forests are fuel, log cabins, mines, docks, salmon packing cases, etc. During World War II Sitka spruce provided airplane construction material. A more solid basis for Alaska's forest industry is the manufacture of pulp, which is exported mainly to Japan for making of paper and rayon. In value of production, fisheries rank first followed by products of the forests and the mines and oil and gas wells. Apart from pulp, exports include petroleum, canned salmon, copper ore, gold, and furs. Among the most important imports are foodstuffs, clothing, and machinery. As transportation facilities, particularly by air, are continually improving, tourism is becoming an important source of income for Alaska, which has scenic attractions not accessible elsewhere in the United States.

Fisheries. The salmon fisheries were formerly the most valuable in the world, but in the 1940's the catch fell off seriously. Cannery production of salmon reached a high of 8,454,948 cases in the 1930's, fell to an average of 2,797,699 cases for the years 1953–57, and remained in that range thereafter. Next in importance to salmon are herring, halibut, clams, and shrimp.

Furs and Game. Next in value below fishery, forest, and mineral products are furs. The most important land furs include red fox, white fox, blue fox, ermine, lynx, marten, mink, muskrat, and land otter. Fur farming, especially with foxes, is carried on extensively. The fur seal herds, on the Pribilof islands, increased, under government supervision, from 215,000 animals in 1912 to about nine times that number in the 30 years following.

The 1940 seal population of these islands was 2,185,136. Sealskins taken in 1941 were 95,013. The handling of this fur seal herd has been one of the most successful in wildlife administration. The total value of furs shipped from Alaska annually frequently exceeds 4.5 million dollars.

Fine and useful game animals are caribou; reindeer; moose; Dall mountain sheep; mountain goats; brown, grizzly, polar, and black bears; elk; deer; and, at present, a herd of musk oxen are being developed on Nunivak island and a herd of bison near Fairbanks. Immense numbers of ducks, geese, and swans of several species breed abundantly throughout practically the entire territory. Other aquatic fowl form almost continuous coastal rookeries—auklets, murres, guillemots, puffins, cormorants, sheerwaters gulls, and kittiwakes. Eagles, owls, hawks, gyrfalcons are included among the land birds.

Agriculture. Owing chiefly to the shortness of the growing season, agriculture is successful only in limited areas and to a moderate degree. Vegetables are the most important products. These are grown in favored ground in the valleys of the Susitna, the Matanuska, the Kenai, the Koyukuk, the Copper, and the Tanana rivers. Hay, barley, and hardy fruits are also produced. Grazing and dairying are carried on in Kodiak island and other grassland districts. Reindeer thrive in moss covered and lichen covered areas. The government maintains four agricultural experimental stations,—a nursery at Sitka, a grain farm at Rampart, a dairy at Kodiak, and a demonstration farm at Fairbanks.

It is estimated that 65,000 square miles is potential farm land and 35,000 square miles is potential grazing land, not including the reindeer range which is very extensive. The area in farms rose from almost zero in 1900 to a peak of 2774 square miles in 1939 and then declined sharply, standing at 1356 square miles in the 1959 crop year. There were 623 farms in 1939 and 382 in 1964. But, despite this sharp decline in number of farms and area of farm land, the area actually cropped almost doubled—increasing from 12 to 23 square miles—and crops more than quadrupled, while farm animals approximately doubled.

Livestock in 1960 included 750 horses, about 6010 cattle, including 2800 dairy cows, 1200 hogs, and 27,000 sheep and lambs. The number of reindeer reported in herds declined from 712,500 in 1929 to 312,854 in 1939. There are about 38,540 reindeer now in western Alaska, of which 13,200 are located on Nunivak Island and are controlled by the Bureau of Indian Affairs. Individual Eskimo herders own the rest of the reindeer.

Farm production in 1967 was valued at $5,524,000, including $1,931,000 for milk, $1,340,000 for grain crops, $607,000 for potatoes, and $214,000 for vegetables. The chief grains grown are oats and barley; hay is also produced. Fruits and vegetables harvested and sold, like other crops, have increased spectacularly, rising in value from $99,000 in 1949 to $214,000 in 1967. The types grown in quantity include strawberries, raspberries, beans, broccoli, cabbages, lettuce, onions, radishes, rutabagas, and turnips. Despite the fact that Alaska is suitable for farming, it is primarily a food-importing area.

Population. In 1970, the population of the state was 300,382, of whom about half were whites, the remainder Indians, with a few Negroes and Japanese.

The Indians of Alaska belong mainly to four great stocks—the Eskimos, the Aleuts, the Athapascans, and the Tlingits. The Eskimos, 15,576 in number, live near the seashore and on islands, chiefly along Bering Sea and the Arctic Ocean. The Pacific Eskimos live on the south coast around Kodiak island, Controller Bay, and Prince William Sound The Aleutian Eskimos occupy areas about the Alaskan Peninsula and extending along the Aleutian Islands. Asiatic Eskimos live on St. Lawrence Island which is part of the Alaskan Territory. The Bering Sea Eskimos live on Nunivak Island and the opposite mainland including the lower Yukon. The Colville Eskimos occupy the Arctic coast near Wainright Inlet, Cape Smyth, and Point Barrow. The Eskimos have proven good workers and are employed at such summer tasks as longshoremen in loading and unloading supply ships. Able bodied Eskimos were drafted for war service in Alaska in World War II.

Juneau, the capital, has a population of 6050. Other important cities and towns are Anchorage, 48,029; Fairbanks, 14,771; Ketchikan, 6994; and Seward 1587. Alaska has in all 70 incorporated places, among which may be mentioned, in addi-

tion to the above, Nome, 2488; Sitka, 3370; and Kodiak, 3798. Population for all of Alaska, 1970, 300,382.

History. In 1741, Vitus Bering, a Danish navigator in the employ of Russia, explored the coast of Alaska. Kodiak island was discovered in 1761 by the Russians, who made a settlement there in 1783. Captain James Cook, in 1778, and Vancouver, in 1793-94, made extensive coastal surveys. Sitka, founded in 1804, became the capital of the Russian territory. The Russians, who were engaged chiefly in fur sealing, did not extensively explore the interior.

In 1867, the United States purchased Alaska from Russia for the sum of $7,200,000—about $12 per square mile, or less than 2 cents an acre.

Preceding the discovery of the gold fields, there was little development, except in connection with the fur trade. Important events in the recent history of Alaska were the fur seal arbitration of 1893, the great gold rush of 1898, the settlement of the Alaska-Canada boundary dispute in 1904, and the construction of the government railway from Seward to Fairbanks, 1916–23.

During World War I, the white population of Alaska declined, but, following the completion of important portions of the government railway and the return of stable conditions, development was again stimulated. Growth of air travel provided an impetus.

In World War II the building up of the defenses of Alaska caused a boom. Numerous military and naval bases were built, especially air bases. Two of Alaska's islands, Attu and Kiska, were occupied by Japanese troops in June 1942. In May 1943, American troops invaded and retook Attu. In the following August, Kiska was bombarded. The landing force found the island had already been evacuated.

The development of atomic weapons and of long range missiles made Alaska a highly strategic point for defense of the United States. Elaborate systems for automatic warning of the presence of airplanes or missiles were constructed as part of lines extending also across Northern Canada, in which the Canadian and American governments pooled their efforts.

The Alaskan flag has a blue field on which gold stars represent the Big Dipper and the North Star. The forget-me-not is the official flower; the willow ptarmigan the official bird. In 1959, Alaska was admitted to the Union as the 49th state.

HAWAII

The state of Hawaii consists of a chain of nine inhabited and several uninhabited islands in the mid-Pacific Ocean. The chief islands are about 2100 miles southwest of San Francisco and approximately 3400 miles southeast of Yokohama, Japan. Their central position in relation to Pacific ports has won for Hawaii the sobriquet "crossroads of the Pacific."

Palmyra Island, 1½ miles in area, lying about 700 miles south of the main group, is officially considered as part of Hawaii. The extreme northwestern islets of the group are called the Midway Islands, being about halfway between Asia and North America. They are inhabited only by the employees of a United States cable station there.

The population of the Hawaiian Islands in 1970 was 768,561. The largest islands of the group are Hawaii, 4030 square miles; Maui, 728; Oahu, 604; Kauai, 555; Molokai, 260; Lanai, 141; Nihau, 72; Kalholawe, 45. The capital, Honolulu, on the island of Oahu, has 324,871 inhabitants.

The islands of Hawaii are of volcanic origin. Their surface is mountainous, reaching, in Mauna Kea, "White Mountain," a maximum altitude of 13,823 feet. If measured from the deep ocean floor, on which it stands, this volcanic giant is several hundred feet higher than Mt. Everest, the world's highest inland mountain. This peak and Mauna Loa (13,675 feet), both in the island of Hawaii, are higher than any other mountain in the islands of the Pacific Ocean. Mauna Loa, "Long Mountain," shares with the near-by mountain of Kilauea the distinction of having active craters which rank among the largest in the world, covering 4.14 square miles. That of Kilauea is about 8 miles in circumference and is the seat of unceasing volcanic activity.

Haleakala, on the island of Maui, has one of the largest of all extinct craters. This crater is 20 miles around and is 2720 feet deep. A 41-square mile area containing it was made a national park in 1961. The island of Molokai is notable for its famous leper settlement. Lanai is owned by a pineapple company which constructed a harbor and a model city. Pearl Harbor, on the island of Oahu, is a United States naval base. It is landlocked, with an area of 10 square miles. The Hawaii Volcanoes National Park includes Kilauea and Mauna Loa on Hawaii Island and Haleakala on Maui.

The climate of the Hawaiian Islands is delightfully equable and invigorating considering its tropical position. Sea level temperatures average between 68.7° F. and 75.8° F. for the Islands. At Honolulu, the maximum recorded temperature is 90° F. and the minimum, 52° F. However, it is a rare summer day in which temperatures rise over 85° F. and a rare winter night when the low is 60° F. Especially noteworthy is the fact that damaging storms, such as hail, tornadoes, hurricanes, and typhoons, are practically nonexistent. Northeast

HAWAII

trade winds blow prevailingly for about 10 months in the year. On account of the mountainous character of the islands, much of the moisture in the winds is precipitated, falling mainly on the northeastern side of each island. As a result, the opposite side has insufficient rainfall and frequently suffers from drought. This rainfall variation is one of the largest in the world. Many rain-drenched windward towns officially report well over 200 inches a year. On the leeward side, averages of 20 to 30 inches are common (Honolulu, 25.8 in.) and are often inadequate for crops and water supply: Rain falls every month of the year, but the summer months are markedly drier. The prevailing sunniness of such lee locations as Honolulu is a notable attraction.

Another significant mountain influence is the change of temperature with altitude. In the land below 2500 feet (Tierra Caliente) frost never occurs and rarely forms even up to 4000 feet. Above 4000 feet (Tierra Templada) frost may occur, and at elevations of 6500 feet snow is occasionally reported.

Above 9000 feet (Tierra Fria) both frost and snow occur regularly and the higher peaks are frequently snow covered. Altogether the Hawaiian Islands are climatically among the most varied in the world.

Plant life is highly varied from tropical jungle to tropical steppe and desert. Only about 10 per cent is grazing land. Approximately four-fifths of the area is unused desert, semidesert, and volcanic waste with dense tropical jungle in favored spots. In the National Park area of the island Hawaii, locally called Big Island, is the world famous "Fern Forest" with some ferns attaining the height of 50 feet. Plant life in the inhabited areas is highly colorful and ornamental providing a major attraction. Among the most noted are royal palms, coconut palms, banyan trees, monkeypod trees, flame trees, bougainvillia, orchid, cacti, hibiscus, poinsettia, plumerias, and ilima. Many of these blooms are made into welcoming leis, a world famous Hawaiian custom with considerable commercial significance.

Although there are many kinds of fish and birds in Hawaii, there is only one mammal that is indigenous to the islands, and that is a species of bat. There are also lizards on the islands.

The soil along the coastal lowlands and in many valleys is very fertile and supports a flourishing agriculture of a tropical type. Since the soils are of volcanic origin they are deep rich clays high in mineral content and capable of sustained yields under cultivation. The staple crops are pineapples and sugar cane. Large quantities of cane sugar and of pineapples are shipped, principally to the United States. Other products exported include coffee, honey, hides, sisal hemp, bananas, rice, wool, tobacco, and cotton. Over half of the total area is in farms and ranches (2.5 million acres), yet only 10 per cent of the total area is cropped.

About 250,000 acres is kept in sugar cane, the major crop, using five times as much land as pineapples. Since the cane is allowed to grow 18 to 20 months before harvesting, the yield per acre is three times that of the annually harvested cane of the United States. Hawaiians annually cut just over half of the acreage in cane. Annual production varies from 700,000 to 1,000,000 tons.

Eighty to ninety per cent of the pineapple products of world trade originate in the Hawaiian Islands, making them world famous. This fame is justly merited, not only in quantity domination over all competitors, but also in leadership in methods of production and processing. Eight corporations dominate the field, led by the Hawaiian Pineapple Corporation founded by James D. Dole, 1922. Confronted by labor shortage, limited water supply, aridity, blowing soil erosion, soil and plant infestations and certain plant food deficiencies, these companies inaugurated far reaching conservation practices. Slopes are contoured; paper covers the soil, conserving moisture, preventing blowing and washing, checking weed growth, thus saving costly weeding. Water supply is obtained by wells, local galvanized roofs, and acres of galvanized sheds on the wetter upper slopes, from which the water can be channeled down as needed; machinery cultivates, plants, harvests, and transports the fruit to the processing factories where all of the pineapple is reduced to valuable products as canned fruit, juice, and citric acid. Cost of services in sanitation, health, and public utilities, formerly provided, must now be borne by the worker. Total sales of pineapples and sugar in 1967 exceeded $324 million, or about 63 per cent of total agricultural income.

Land tenure is a problem, with 60 per cent of the land owned either by the state or by large estates. The famous Bishop Estate owns 10 per cent and endows philanthropic enterprises such as the Kamehameha schools with the million dollar income. The Federal Government owns 429,076 acres, of which 373,384 is in National Parks and 55,559 is under the Navy.

The tourist industry ranks third after sugar and pineapples as an industry. Superior natural attractions are enhanced by luxurious accommodations to make this a world prominent resort. The Pan American Airways and United Air Lines contact the islands from San Francisco in a breakfast-to-dinner run. Several steamship lines connect the island with the United States, Canada, and the Orient. The Moana and Royal Hawaiian hotels on Waikiki beach are widely known.

Honolulu, on Oahu Island, is the capital and chief port of Hawaii. Its name means "quiet harbor." The harbor, which has excellent freight facilities, is almost entirely enclosed by a natural breakwater of coral reefs. The population of the state has a mixed character. More than half are Japanese and Chinese. White inhabitants number less than one-fourth of the total. The aborigines constitute a still smaller proportion. A similar complexity characterizes the language and the religion of the territory. The aborigines are mainly Protestant Christians, although some of their pagan beliefs and customs survive. The Hawaiian natives belong to the Polynesian race. When discovered, they had a well developed political system and a literature. Niihau is still maintained as a pure native asylum by the exclusive Robinson family

The Hawaiian Islands were first made known to the world by Captain James Cook, who discovered them in 1778. He called them Sandwich Islands after the earl of Sandwich. At that time, each island had its king, who exercised authority by a species of feudal organization. In 1790, Kamehameha, one of the kings, extended his sway over the entire group of islands. His successor, being opposed by those who upheld the native worship, abolished the old religion. Christianity was introduced as early as 1820. A system of universal, compulsory education is now established there.

In 1842, the kingdom of Hawaii was recognized by the United States. An internal struggle for constitutional rights arose and lasted, with interruptions, until 1893, when the reigning queen, Liliuokalani, was deposed. An appeal for annexation to the United States was made, but it was rejected by President Cleveland. A second appeal, made to President McKinley, resulted in the approval by Congress, July 7, 1898, of a treaty of annexation. In 1900, the islands were formally organized into the territory of Hawaii, and a territorial governor was appointed by the president. In 1959, Hawaii was admitted to the Union as the 50th state.

On Kealakekua Bay, Hawaii Island, stands an obelisk commemorating Captain Cook, who was slain near that point by natives in 1779. In 1928, a bronze tablet was dedicated in his honor and placed just below the surface of the water to mark the exact spot where he fell. The adjacent region, known as Kaawaloa, was made into a public park.

UNITED STATES DEPENDENCIES

Like the other powerful nations of the 19th century, the United States acquired a number of dependencies. Since America's independence had stemmed from revolt against colonialism, the name colony was never applied to these dependencies. Moreover, the question of their acquisition was the source of bitter political debate, particularly when the Philippines, Puerto Rico, and Guam were ceded to the United States in 1898, American Samoa was acquired by treaty with Britain and Germany in 1899, and Hawaii was annexed in 1900. Alaska had already been purchased from Russia in 1867. The Panama Canal Zone was obtained by treaty with Panama in 1903; the Virgin Islands were purchased from Denmark in 1917.

It has been the official policy of the United States to provide stable government for the possessions and to encourage their economic and educational

development with a view to their eventual self-government. Of the above dependencies, the Philippines was granted independence as the Philippine Republic in 1934, and Alaska and Hawaii became states in 1959.

This policy of development has entailed the building of railroads, highways, waterways, and harbor facilities, the introduction of improved methods of agriculture, and the founding of suitable manufacturing industries. Basic to such improvement was provision of free public schools and other educational facilities. The introduction of modern sanitation methods and of methods of preventing and treating diseases led, not only to improved well-being, but to rapid population increases that paced the economic advances.

In this section is treated the geography of American Samoa, Canal Zone, Guam, Puerto Rico, and the Virgin Islands. The small islands of Wake and Midway, and the South Pacific Islands which the United States received in trust under the United Nations for eventual return to Japan, are treated in the Department of Government and Politics.

AMERICAN SAMOA

A group of four inhabited and several uninhabited islands in the south Pacific Ocean, about 4200 miles southwest of San Francisco and about 2000 miles east of Australia. The inhabited islands are Tutuila, Tau, Swain's Island and those of the Manua group—Ofu and Olosega. The total area is 76 square miles.

The islands are largely mountainous in character, but much of the soil is extremely fertile. The moist tropical climate of the islands fosters a luxuriant vegetation. Agriculture is the principal occupation and is carried on mainly by family groups, each of which is directed and ruled by a patriarch, or *matai*. The chief products include copra, taro, breadfruit, yams, pineapples, oranges, and bananas. Copra and canned tuna are exported.

The only large port of American Samoa is Pago Pago. It is a United States naval station under a commandant. The population in 1970, 29,000 (est.). Schools were established in Samoan villages by Christian missionaries as early as 1830. Elementary education in English is available for all in schools supported by the government.

This group of islands came under American sovereignty in 1899 as the result of a treaty with Great Britain and Germany. Since the establishment of American control, the islands have made substantial gains in population and in social welfare.

CANAL ZONE

A strip of land ten miles in width, through the center of which runs the Panama canal. The Canal Zone divides the Republic of Panama into two parts.

The zone was obtained in 1903 from the Republic of Panama for the sum of $10 million with an annual payment of $250,000, changed in 1936 to 430,000 balboas after the American dollar had been devalued in terms of gold. Its affairs are administered by a governor appointed by the United States government. A railroad connects the two terminals of the canal—Balboa, the Pacific port, and Cristobal, on the Caribbean sea. Population 1970, 44,650. See *Panama Canal.*

GUAM

The largest and most southerly of the Mariana Islands, Guam is situated in the Pacific Ocean about 1700 miles east of Manila and some 6000 miles southwest of San Francisco.

The island of Guam is about 30 miles long, and varies in breadth from 4 to 8½ miles, its estimated area being 210 square miles. It is mountainous in the south but plateau-like in the north. Broken coral reefs fringe the shore.

There are only two seasons—a wet season and a dry one. Though the temperature averages 81° F. the year round, the climate is healthful. The soil is fertile, well watered, and yields abundant crops of copra, corn, sweet potatoes, taro, cassava, bananas, citrus fruits, and sugar cane. There are no import duties. Agana, the capital, is the chief city. Apra is the port of entry.

From 1898, when it was acquired from Spain, Guam was administered by the United States navy department, but in 1950 it came under the supervision of the department of the interior.

The natives are of a mixed race, called Chamorros, with the Malayan strain predominating. Chamorro, the native language, and also Spanish and English are spoken.

Guam was discovered in 1521 by Magellan. In 1565, the Spanish took possession of the island. It remained under Spanish rule until 1898, when, as a result of the Spanish American war, it was ceded to the United States. Its location has made it of great strategic importance both as a naval and an air base, and military establishments occupy about one-third of the usable land. During World War II, the Japanese held it from 1941 to 1944. Population, 1968 (est.), 101,000.

PUERTO RICO

A West India island lying about 70 miles east of Haiti and 1425 miles southeast of New York. The island is about 100 miles long and from 30 to 40 miles wide, and has about three times the area of the state of Rhode Island.

The climate of Puerto Rico is regarded as the most healthful in the tropics of the western hemisphere. Through the middle of the island, a broken range of mountains extends from east to west, their altitude varying from about 2000 feet to that of the culminating peak of El Yunque, 3532 feet high. These mountains are clothed to their summits with luxuriant vegetation. The coast belt is a broad, level alluvial plain. The soil is exceedingly fertile and, as the population is dense, most of the arable land is under cultivation.

On the eastern and on the northern slopes of the mountains there is abundant rainfall, the average yearly precipitation being 65 inches. But, in the southern part of the island, irrigation is required in some districts, as the mountains intercept much of the moisture in the trade winds. Puerto Rico is noted for its fine forest trees. Palms, Spanish cedar, ebony, mahogany, ausubo, laurel, sandalwood, and dyewoods abound.

The mineral resources of Puerto Rico, so far as developed, consist chiefly of limestone and volcanic boulders, used in building; various clays, used in making brick and pottery; and gypsum, used for stucco, plaster, and fertilizer. Deposits of marble and lignite occur; along the south coast there are extensive phosphate beds; and on the northern coast there are nearly pure silica sands, used in the manufacture of glass and china. Gold, copper ore, iron ore, and the ores of various other metals have been found in small quantities.

Agriculture is the chief industry, but in recent years manufacturing has rivaled it in value of output. Sugar is the most important crop, followed by tobacco, coffee, pineapples, grapefruit, oranges, and other tropical fruits. After World War II, the government put into effect a policy of purchasing farm land from large corporations and turning it over to individual farmers on a "proportional profit" basis. An aggressive policy of industrialization also was followed, and many United States corporations extended operations to Puerto Rico to take advantage of the tax incentives offered.

Nearly all the exports go to the United States. The chief one is sugar, which was valued at about $92 million in 1968–69. Textile fibers, rum, liquor, and molasses are also exported extensively.

Puerto Rico is densely populated, with about 800 inhabitants to the square mile. To encourage new industries and provide employment, the insular government in 1942 created the Industrial Development Company, which established a number of factories.

Geography

Source: Office of Information, Economic Development Administration, San Juan, Puerto Rico

A bank with a liberal industrial loan policy was also set up, and in 1948 certain industries, old and new, were granted a twelve-year exemption from taxes. That same year the hydroelectric power of the island was increased by the completion of the Caonilas dam.

The principal cities and seaports are San Juan, the capital, on the north coast, with a population of 444,952; Ponce, on the south coast, population 125,926; and Mayaguez, on the west coast, population 69,485. The harbor at San Juan, which has been extensively improved by the United States government, is one of the best in the West Indies. A railroad, built near the coast, almost completely encircles the island, and there are branches into the interior. Surfaced highways, of which more than 3520 miles have been constructed, facilitate transportation in various parts of the island.

Under the school system, education is free and compulsory. In 1968–69, there were 720,313 pupils enrolled in Puerto Rican schools. There is also a well-distributed system of night schools and kindergartens. Colleges include the University of Puerto Rico, at Rio Piedras; the Catholic University of Puerto Rico, at Ponce; the Inter-American University, at San German; and the College of the Sacred Heart, at Santurce. The percentage of illiteracy has declined from 83 per cent in 1889, to 14 percent in 1966.

Puerto Rico was discovered in 1493 by Columbus. The first settlement was made at Pueblo Viejo in 1508 by Ponce de Leon, who, in 1509, was appointed governor by King Ferdinand of Spain. Although attacked at various times by the English and the Dutch, Puerto Rico remained in the possession of Spain until 1898, when, at the close of the Spanish American war, it was ceded to the United States. Since the establishment of American methods of agriculture, American public schools, improved highways and railways, and various civic improvements, Puerto Rico has made remarkable progress. Population. 2,739,000.

VIRGIN ISLANDS

A group of some 50 tropical islands and islets formerly called the Danish West Indies. They lie about 40 miles due east of Puerto Rico. The total area of the group is about 149 square miles, of which 132 is comprised in the three largest islands—Saint Thomas, Saint John, and Saint Croix (Santa Cruz). Almost all the inhabitants are Negroes or mulattoes. Population, 1967, 54,545 (est.).

Saint Thomas is the best known of the islands because its principal town, Charlotte Amalie, population 12,880, is located on one of the finest harbors in the West Indies. The surface of the island is rugged and elevated, and the soil is poor. The exports are principally rum and hides. Most of the imports are foodstuffs and wearing apparel. The College of the Virgin Islands is located on St. Thomas. The area of the island is about 28 square miles. Population, 1967, 28,705 (est.).

Saint Croix, the largest and wealthiest of the islands, lies about 40 miles southeast of Saint Thomas, and has two well-known towns, Frederiksted (Westend) and Christiansted (Bassin). The latter was the capital of the islands under Danish rule. Sugar cane is the chief crop. Longstaple cotton is grown, and cattle are raised. The area of the island is about 84 square miles; population, 1967, 24,295 (est.).

Saint John, the smallest of the three main islands, grows bay leaves for the distillation of bay oil and also has a considerable acreage devoted to cotton, sugar cane, and tobacco. The entire population is considered rural. The area of Saint John is about 20 square miles; population, less than a thousand.

The Virgin islands were discovered in 1493 by Columbus. Saint Thomas was first colonized in 1672 by the Danes. Saint Croix, first occupied in 1625 by Dutch and English settlers, came into the possession of Denmark in 1733. With the exception of two periods—1801-02 and 1807–15—during the Napoleonic wars, when they were seized and held by the English, most of the islands were under the Danish flag for a period of 245 years. In 1917, upon payment of $25 million, they came into the possession of the United States by purchase.

During the days of sailing ships, especially about 1820, Saint Thomas was a supply point of great importance in the West Indian trade. Before the abolition of slavery, in 1848, in the islands, sugar growing was a substantial industry. With the decline of the sugar industry, the population decreased, falling gradually from about 40,000 in 1850 to about 26,000 when the United States took possession in 1917. Tourism has become the chief industry.

The value of the Virgin islands now lies chiefly in their geographic location and their exceptionally fine harbor facilities. Their situation with reference to the Panama canal makes Saint Thomas of great strategic importance as a naval base and as a coaling station.

IN the selection of topics for this section of American geography, the following considerations have governed:

Capital Cities. All capitals of states, territories, and dependencies of the United States are given an item because of their political importance.

Largest Cities. Size in itself would dictate the selection of a large proportion of the cities of United States for special articles. But with size normally go commercial and industrial importance and numerous cultural activities which make their inclusion doubly essential.

Smaller Cities and Places. Various cities and towns with a population of less than 50,000 have been included for specific reasons, such as historical associations like those of Gettysburg, Plymouth, and Ticonderoga, or proximity to features of travel interest, as in the case of Adamana and Grand Junction.

Other cities, such as Butte, Cohoes, Hibbing, Riverside, and Anaconda, are included because they are leading centers in some important economic enterprise. Still others have been selected primarily because they are seats of universities, colleges, or other important educational institutions. Examples of this kind are Ithaca, Oberlin, and Princeton.

The more important Indian towns of the Southwest are given brief treatment. Among these are Isleta, Laguna, and Zuni. Selections of resorts have also been made, including Lake Placid, Palm Beach, and Saratoga Springs. Of the less populous states, the largest and, usually, the second and third largest cities have been included.

Cities of the continental U.S. whose population exceeds a half-million have generally been given special topical treatment. Descriptive matter is divided into topics under separate subheadings. The treatment follows a uniform plan, beginning with a description of the locale, then describing streets, parks, buildings, educational institutions, industries, and other leading features, and ending with important points in the city's history.

Populations figures are based on final U.S. Bureau of the Census reports. At the end of the section appears a tabulation of cities having a population of 30,000 or more in 1970, with populations in that year and in 1960.

Scenic and Travel Interest. Among topics of scenic and travel interest will be found descriptions of some of the most noted features of the continent, including mountains, lakes, deserts, islands, waterfalls, gorges, cliffs, and caves. Examples of the mountains are Mount Rainier, Mount Shasta, Lassen Peak, and Mount Washington. The lakes include Lake Champlain, Lake George, Itasca Lake, and Lake Tahoe. Among the deserts described are Death Valley, the Mojave, the Colorado, and the Painted Desert. Representative of the other scenic features mentioned above are Niagara Falls, Luray Cavern, Mammoth Cave, and the Palisades.

Numerous features, combining both scenic and historic interest, include Harpers Ferry, Lookout Mountain, Stone Mountain, and Starved Rock. Various special regions, such as the Cotton Belt, the Corn Belt, the Wheat Belt, the Citrus Belt, the Blue-Grass Region, and the Inland Empire, are also described. Although the numerous national parks and national monuments are given tabular treatment elsewhere, some of the most noted are described in greater detail in this section; as, for example, Yellowstone Park and the Grand Canyon

Aberdeen. A city of South Dakota, situated in the northern part of the state at the junction of U.S. highways 12 and 281. Aberdeen is the commercial center of a rich agricultural district, producing large crops of wheat, corn, hay, and potatoes. Its industries include meat packing, flour milling, and the manufacture of machinery. The city is the seat of Northern State College, which has a large open-air theater. Population, 1970, 26,476.

Aberdeen. A city of western Washington, on Grays harbor, 50 miles west of Olympia. Aberdeen is a timber, dairy, and agricultural center, with lumber and plywood mills, fish-curing houses, canning establishments, and excellent port facilities. It adjoins Hoquiam on the west and Cosmopolis on the east. Its inhabitants have a large Scandinavian element. Population, 1970, 18,489.

Abilene. This city in Kansas, 100 miles west of Topeka, was established in 1860 as a shipping point at the end of a trail over which cattle were driven from the Southwest. It has become a flourishing trade center for livestock and grain, particularly wheat. The boyhood home and burial site of Dwight D. Eisenhower, Abilene is the seat of the Eisenhower Museum. A part of old Abilene is being restored as it was in pioneer days. Population, 1970, 6,661.

Abilene. A city located in west central Texas. Long known as an agricultural and livestock center, it has added manufacturing (including aerospace components and ladies' garments), and oil production. Nearby is the Dyess Air Force Base. Educational institutions are Hardin-Simmons University, McMurry College, and Abilene Christian College. Population, 1970, 18,563.

Adamana (*ă'dă-mă'nà*). A small village on the Santa Fe railway in eastern Arizona. Near it are located the celebrated "petrified forests." Of the three forests which together constitute the Petrified Forest national park, two lie at distances of from 6 to 9 miles south of Adamana. Here some thousands of acres are covered with fragments of petrified wood and with wonderfully preserved fossil tree trunks, many of which are 4 feet in diameter. One of these large mineralized trunks, by spanning a ravine 45 feet wide, forms a natural bridge.

The third forest, usually called "Rainbow Forest," is more readily reached by automobile road from Holbrook, a railway town 20 miles west of Adamana. In this petrified forest there are several hundred whole trees, some of which are more than 200 feet long and 6 feet in diameter, all partially embedded in the ground. These are the remains of great cone-bearing trees that grew in geological times.

Agaña (*ä-gän'ya*). The capital and chief town of Guam, situated on the west coast of the island. Official buildings such as the Governor's Palace, Administration Building, and Post Office are situated here. The people are principally merchants or are in professional trades. Nationalities include Guamanians, Americans, Filipinos, and Japanese. In 1940 Agaña was annexed to Sinajana. Population, 1968, 2400.

Akron. A rubber manufacturing city of Ohio, located 35 miles southeast of Cleveland, with a grain producing region to the south and rich dairy country to the north.

Akron has long been noted for its clay products. With the rise of the automobile industry, the city became the center of the world's most extensive manufacture of automobile tires and of rubber goods in general. It produces also synthetic rubber, fishing tackle, zinc oxide, machine shop products, sulphur, salt, and children's books and is the principal center for the manufacture of sheet metal products, defense equipment, and airships. A huge dirigible air dock, The Goodyear Air Dock, adjoining the municipal airport and covering 9 acres, was opened in 1930. Truck transportation is a major activity.

Within the city there are 26 beautiful parks; these cover a total area of 2200 acres. The Portage Lakes, a 2250-acre state park, lies just south of the city. A steel bridge, 190 feet high, spans the Cuyahoga River within the city, and the North Hill viaduct, 135 feet high and 2810 feet in length, provides the main approach from the north and east. Symbolic of Akron's prominence as a rubber center is the Harvey S. Firestone Memorial, created by architect Eric Gugler and sculptor James Earle Fraser, and dedicated in 1950 to commemorate half a century of progress since the founding of the Firestone Company. The chief educational institution is the state University of Akron. "Derby Downs" is the scene each August of the International Soap Box Derby. Population, 1970, 275,425.

Alameda (*ăl'ă-mā'dà; -mē'dà*). A city of California, occupying a narrow island on the east side of San Francisco Bay, opposite San Francisco and directly south of Oakland. An underwater tube and five bridges link the city to the mainland and major highway systems. Alameda is a beautiful residential city, with numerous fine streets and homes. It also maintains substantial industries, among

which are potteries, shipbuilding, and the manufacture of motors, pumps, engines, airplanes and lumber. A large naval air station is located there. Alameda's seven miles of municipal beaches, two yacht harbors, and seven parks provide recreational facilities. Population, 1970, 70,968.

Albany. The capital of New York State, situated on the west bank of the Hudson River, near the head of the Tidewater, 145 miles north of New York City.

Albany is the connecting link between the state's barge canal system and ocean navigation via the Hudson River. A feature of its terminal facilities is a grain elevator covering eight acres. Because of its extensive railway connections, the city is one of the leading transfer points in the United States for passenger, express, and mail traffic. Albany is said to have been the first American city to have a municipal airport, having provided one in 1917. The city's manufactures are extensive and varied. Among the chief products are car heaters and other metal wares, clothing, knit goods, paper products, flour, printing, meat-packing products, and felts.

The city occupies a commanding site, affording superb views of the Hudson River valley. Washington Park, the largest of the 27 units in the city's park system, is noted for its natural beauty.

The most imposing building is the State Capitol, which cost over $29 million. The structure, 400 feet long and 300 feet wide, is built of Maine granite in the Renaissance style. The State Office Building, 34 stories high, is the city's tallest structure. Among other noteworthy buildings are the Albany Institute of History and Art; the old Schuyler Mansion, dedicated in 1917 as a historical monument; and Saint Peter's Church.

Albany's educational institutions include the State University of New York at Albany, Albany Law School (Union University), Albany Medical College, and the College of St. Rose.

Established by the Dutch as a trading post in 1614, Albany is said to be the second oldest permanent settlement within the limits of the thirteen Colonies. Its charter, granted in 1686, is said to be the oldest in the United States. The city was Burgoyne's objective before the battle of Saratoga. Population, 1970, 114,873.

Albuquerque (*ăl'bû-kûr'kē*). A city of New Mexico, on the Rio Grande River, slightly northwest of the center of the state. It lies at an elevation of 5000 feet, in a bracing, sunshiny climate, and is a noted health resort. The old town, founded in 1705 by the Spanish, remains as a division of the modern city, which dates from 1879.

Albuquerque is the trade center of a rich timber, livestock, and irrigation farming district. A leading occupation is the entertainment of tourists. The University of New Mexico is located here. The more notable structures include a Federal Building and the Harvey Indian Museum. Features of interest in the vicinity are the ancient church of San Felipe de Neri, built in 1735, and the Isleta Indian pueblo. Population, 1970, 243,751.

Alcatraz. An island in San Francisco Bay, about a mile from the mainland. Its shores rise precipitously from the sea. It had been fortified by the Spaniards. From 1858, it was used by the United States government to intern military prisoners. Beginning in 1933, it was used to incarcerate prisoners convicted of kidnapping, murder, and other serious charges, mostly involving life sentences. It was chosen for the purpose as being practically escape-proof and was designed for punishment rather than reformation. Its use as a prison was discontinued in 1963.

Alexandria. A historic city of northern Virginia on the west bank of the Potomac River, six miles below Washington, D. C. Among its many quaint old buildings are Old Christ Church, which George Washington and Robert E. Lee attended; Carlyle House, where Braddock, in 1775, organized his expedition against Fort Duquesne; and the home of Robert E. Lee. The George Washington National Masonic Memorial, erected at a cost of $5 million, is the most imposing modern building. Alexandria's freight classification yard is one of the largest in the country. Refrigerator cars are made in the city. Population, 1970, 110,938.

Allentown. A manufacturing city of Pennsylvania, 50 miles north of Philadelphia. The products of Allentown's industries include electronic components, trucks, fire engines, communication equipment, textiles, shoes, food and beverages, paints, furniture, and numerous items of metal and paper. Founded in 1762 by William Allen, Chief Justice of Pennsylvania, the city has interesting historical traditions. During the Revolutionary War, the Liberty Bell was concealed here to prevent its capture by the British. The city is the seat of Muhlenberg, Cedar Crest, and Pennsylvania Wesleyan colleges. Population, 1970, 109,527.

Altoona. A railroad city of central Pennsylvania picturesquely situated in a mountainous district about 100 miles east of Pittsburgh. The major industry is railway shop construction and repairs, enormous car shops of the Pennsylvania railroad being located in the city. Other products are textiles and clothing. Population, 1970, 62,900.

Amarillo. This leading commercial and industrial center in the northwestern or "panhandle" section of Texas, is a focal point by rail, air, and highway for one of the richest gas and oil regions in the United States. Helium-bearing sands are found nearby, and the city is the chief producer of this gas for airships. Other industries include oil refining, zinc smelting, meat packing, and flour and cottonseed oil milling. Educational institutions include Amarillo College. Population, 1970, 127,010.

Anaconda. A mining city of southwestern Montana, 26 miles northwest of Butte. Anaconda was founded in 1884 by the Anaconda Copper Mining Company, which has there one of the world's largest non-ferrous reduction plants. It is often called the smelting city and is said to have the tallest smokestack in the world. Population, 1970, 9,771.

Anaheim. A city 28 miles southeast of Los Angeles in the Santa Ana Valley of California. Chief among its diversified industries is the packing and canning of citrus fruits, especially oranges. Population, 1970, 166,701.

Anchorage. A city of Alaska which was founded in 1914 and became construction headquarters for the railroad between Seward and Fairbanks. Reflecting the interests of a growing community, it has expanded to include a land office, an international airport, shipping agencies, oil-producing companies, and varied manufacturing and commercial enterprises. Population, 1970, 48,029.

Anderson. A city in Indiana on the White River, 35 miles northeast of Indianapolis. It is in an agricultural region for which it is a business and industrial center, manufacturing steel products and appliances, among other things. It is the seat of Anderson College. Population, 1970, 70,787.

Annapolis. The capital of Maryland, situated on the right bank of the Severn River, near the center of the western coast of Chesapeake Bay. The city was first settled in 1649, and was called Providence. In 1694, it was named after Queen Anne and was made the capital of the colony of Maryland. The first Federal Constitutional Convention met in Annapolis in 1786. The city is the seat of the United States Naval Academy, on a beautiful site of 200 acres, organized in 1845, and of Saint John's College, founded in 1696. The industries include an oyster packing plant. Population, 1970, 29,592.

Ann Arbor. A city on the Huron River, 36 miles southwest of Detroit. It is an industrial and trading center in the midst of an agricultural region. It is the seat of the University of Michigan. Population, 1970, 99,797.

Appalachian Trail. A wilderness foot trail extending 2050 miles from Mount Katahdin, Maine, to Mount Oglethorpe, Georgia. The longest marked foot path in the world, it follows in general the ridge of the Appalachian Mountains. The project was begun in 1921, largely through the initiative of Benton MacKaye, forester and specialist in regional planning; it was completed in 1938.

Asbury Park. A city of New Jersey, on the Atlantic Ocean, about 40 miles south of New York City. Asbury Park is noted chiefly as a seaside resort and residential city. It has, however, various small industries, including the manufacture of silk, women's apparel, electronic equipment, and leather clothing. Population, 1970, 16,533.

Asheville. A mountain resort and city of North Carolina, picturesquely situated in "The Land of the Sky," a plateau of the southern Appalachian Mountains, 2300 feet above sea level, at the western extremity of the state. It is near Great Smoky Mountains National Park, Mount Mitchell, and numerous other points of scenic interest. Near Biltmore Forest, a suburb, is situated the magnificent estate of George W. Vanderbilt, which is open to the public. Other features of the city include Pack Memorial Library, Grove Arcade, covering an entire block, and the civic center on Pack Square. Craggy Rhododendron gardens, 600 acres of royal purple rhododendrons 15 miles from the city, is one of the finest natural gardens in the world.

Asheville provides a market for nearby producers of fruit and is an important distribution center. Manufactured products include furniture, plastics, mica, rayon, cotton textiles, and blankets. The city was incorporated in 1797. Population, 1970, 57,681.

Astoria. A port of northwestern Oregon, located on the Columbia River, about 10 miles from its mouth. It is noted chiefly for the catching and canning of salmon on an immense scale. Tuna also is caught and packed there. Other industries include lumber mills, and creameries. Astoria has river, rail, and bus transportation to Portland, 105 miles distant, and also considerable ocean commerce, with exports of lumber, grain, fish, and flour. It has also a large tourist traffic. Astoria was named for John Jacob Astor, who founded it in 1811. The first post office and the first customhouse west of the Rockies were located here. Population, 1970, 10,244.

Athens. A city of northern Georgia, on the Oconee River, some 70 miles east of Atlanta. Its industries produce electronic components, non-woven fabrics, textiles, clocks, transformers, baseball bats, and precision parts for the aerospace industry. Athens is a noted educational center and is sometimes styled the "classic city of the South." Its leading institutions include the University of Georgia (the oldest state-chartered university) and the Georgia Center for Continuing Education. The city is known for its ante-bellum homes and memorial gardens. Population, 1970, 44,342.

Atlanta. The capital of Georgia, situated in the north central part of the state, about 300 miles northwest of Savannah.

The ridge on which the city is built is a part of a watershed dividing streams that flow into the Atlantic from those that flow into the Gulf of Mexico. The city lies about 1050 feet above sea level. The Chattahoochee River, flowing within 8 miles of the city, is the source of its water supply.

Atlanta is admirably, though somewhat irregularly, laid out, and contains many beautiful avenues and streets. The city covers about 34 square miles, and includes a park system embracing a total area of more than 1200 acres and containing 75 parks, squares, and open spaces. In Grant Park there is a great cycloramic painting of the battle of Atlanta. About 15 miles to the east of Atlanta is situated Stone Mountain, on the face of which is a huge sculptured memorial to the valor of the Confederate soldiers. The commercial district contains many notable buildings, giving the city a metropolitan aspect. Among these are the State Capitol, the Atlanta Public Library, the Federal Building, the Terminal Station, the Federal Reserve Bank, and numerous imposing office buildings.

Atlanta is a prominent educational center and contains many widely known institutions of learning. Among the leading institutions of higher learning are the Georgia Institute of Technology, Emory University, Oglethorpe University, and Columbia Theological Seminary. The institutions for women include Agnes Scott College, located in the adjoining suburb of Decatur. Among the institutions for Negroes are Atlanta, Clark, and Morris Brown universities, Morehouse College, and Gammon Theological Seminary. There are excellent libraries, and the city is one of the chief centers of printing and publishing in the South.

Because of its advantageous situation and excellent railway facilities, Atlanta has become the chief inland commercial city of the southeastern states. It is the distributing center for a large region and has developed extensive industries, ranking first in the state in manufactures. The leading products include cotton mill products, automobiles, aircraft, confectionery and ice cream, Coca-Cola, furniture, mattresses and bed springs, lumber, clothing, and fertilizers. The city conducts a large merchandising trade.

The growth of Atlanta dates from the building of the first railroads in northern Georgia. The site was settled about 1839. In 1843 it was incorporated as Marthasville. This name was changed to Atlanta in 1845, and in 1847 a city charter was granted. Because of its location, it was one of the most important cities of the Confederacy, and in 1864 was the objective of General Sherman's campaign from Chattanooga. The battle of Atlanta and other severe engagements were fought near the city, which was finally taken by the Union forces and largely destroyed. It was quickly rebuilt after the war and grew rapidly. In 1878, it was made the capital of the state. Population, 1970, 496,973.

Atlantic City. An all-year seaside resort on Absecon Beach, a sandy island five miles off the southeastern mainland of New Jersey, about 55 miles southeast of Philadelphia. There are about 1200 hotels and motels for the accommodation of visitors, the number of which often exceeds 15 million annually. The attractions include many miles of beaches, six large recreation piers, a $28 million convention hall covering 12 acres and seating 41,000 people in its auditorium, and the "Boardwalk," a magnificent promenade, 60 feet wide, extending along the ocean front for a distance of five miles. Permanent population, 1970, 47,859.

Augusta. A commercial and manufacturing city of eastern Georgia, located at the head of navigation on the Savannah river, about 132 miles northwest of Savannah. Augusta is the trade center of a rich agricultural district and one of the leading cotton markets in the United States. Water power and hydroelectric power are extensively used in the city's substantial industries, the chief of which are the manufacture of cotton goods and cottonseed products. Other manufactures include brick, lumber, and fertilizers. A United States arsenal is located there. Augusta was established in 1735, and for a time during and after the Revolutionary War was the capital of Georgia. Educational institutions include Paine College, for Negroes, and the University of Georgia Medical College. Population, 1970, 59,864

Augusta. The capital of Maine, situated on both banks of the Kennebec River, about 40 miles from its mouth. The State Capitol is a handsome structure, built of granite quarried locally. Excellent water and rail transportation facilities have made the city the trade center of a large district. It is also a leading air travel center. Local industries include cotton, paper, and lumber mills. Population, 1970, 21,945.

Aurora. A city of northeastern Illinois, occupying a beautiful site on the Fox River, 38 miles west of Chicago. It is an important manufacturing and railroad center, producing road-building machinery, pumps, drills, and other metal products. Its educational institutions include Aurora College. Aurora was settled in 1834 and chartered as a city in 1857. Population, 1970, 74,182.

Ausable (*ô-sā'b'l*) **Chasm.** A narrow gorge of great scenic attractiveness, situated in northeastern New York, about midway between the Adirondacks and Lake Champlain. The rocks forming the walls are of hard Potsdam sandstone, traversed by numerous fault lines or displacements. Through these the Ausable River has worn a zigzag course about 2 miles long and, in places, 175 feet deep.

Austin. The capital of Texas, located on both sides of the Colorado River, in the south central part of the state. The State Capitol, situated in the ten-acre Capitol Square, is one of the largest in the U.S. Austin is the seat of the University of Texas.

A chain of seven lakes begins within the city limits and winds 150 miles through wooded hills. Called the Highland Lakes, they were created by Colorado River dams as a system for flood control, irrigation, power development, and provision for recreation. The city is the center of a considerable wholesale and shipping business, and carries on an extensive trade in agricultural products, wool, and livestock. Its industries include the manufacture of furniture, electronic instruments, office equipment, food products, finished stone, and fiberglass boats and motor homes. The "association center" of the Southwest, Austin is the headquarters for more than 225 state and national organizations. Austin was incorporated in 1839 and named for S. F. Austin, the "Father of Texas." The site had been selected in 1837 by a state commission instructed to find the most attractive spot for the capitol. Population, 1970, 251,808.

BALTIMORE. The principal city of Maryland, and the largest on the Atlantic seaboard south of Philadelphia. It is situated on the estuary of the Patapsco River, 12.5 miles from Chesapeake Bay and about 170 miles by water from the Virginia capes on the Atlantic. Washington, D. C., lies about 40 miles southwest, and Philadelphia, 97 miles to the northeast. The area of Baltimore is about 79 square miles.

Buildings. Many of the public buildings are noted for size and architectural beauty. Among these are the Peabody Institute, the Roman Catholic Cathedral, said to be the oldest in the United States, the First Presbyterian Church, the Enoch Pratt Free Library, the Walters Art Gallery, the Baltimore Museum of Art, the City Hall, the Federal Building, and the Masonic Temple. The Baltimore Trust Company Building, 509 feet high, affords a landmark of conspicuous beauty.

Parks and Monuments. Many fine parks are scattered throughout the city. Of these, Druid Hill Park is the largest and finest. Other noteworthy parks are Clifton, Patterson, Carroll, Herring Run, and Gwynns Falls. A statue of Columbus, unveiled in 1792, the first in any American city to be dedicated to the great discoverer, stands on the grounds of the old Ready school. Mount Vernon Place, the nominal center of the city, is the site of the Washington Monument, a stately column of marble 210 feet high. This monument, the cornerstone of which was laid July 4, 1815, was the first erected by any city in memory of George Washington. Edgar Allen Poe is buried in Westminster Cemetery, one of the oldest and smallest in Baltimore.

Educational Institutions. Baltimore is the seat of Johns Hopkins University, a leading institution of higher

learning. Connected with it is the widely known Johns Hopkins Hospital. Among other important educational establishments are the University of Maryland, Goucher College for Women, Loyola College, Morgan College, St. Mary's Seminary, and Notre Dame Academy. The Peabody Institute contains a valuable historical library.

Transportation and Commerce. In its magnificent system of railroads, its excellent harbor, and its extensive docks, Baltimore has every facility for railway and overseas transportation. Baltimore harbor, one of the largest on the continent with a minimum depth of 35 feet, is capable of accommodating large ocean steamers. Ocean steamers load and unload directly from and into railroad cars at the piers. Baltimore is the chief mercantile and jobbing city of the south Atlantic states and ranks as one of the leading export and import centers of the country. There is an extensive coastwise and intercoastal trade.

Manufactures. Baltimore ranks among the leading cities of the United States in total value of manufactures produced. The principal industries are the making of iron and steel products (the largest single group), shipbuilding, copper, petroleum and sugar refining, and the manufacture of clothing, aircraft, malt and distilled beverages, tin plate, fertilizers, chemicals, and copper products. There are also large establishments for canning fruits and for packing meats and oysters.

Baltimore owes its commanding position as regards manufactures to its easy access to domestic and foreign raw materials and to principal American and world markets.

History. The first settlement within the present limits of the city was made in 1662. The city was founded in 1729 and was incorporated in 1796. At the time of the American Revolution and especially during the Napoleonic wars, Baltimore attained prominence as a seaport. Its fame was spread throughout the world by its fast-sailing ships called "Baltimore clippers." During an unsuccessful attack by the British on Ft. McHenry, which guarded the city, Francis Scott Key, in 1814, wrote the "Star-spangled Banner."

Baltimore was the first American city to be lighted by gas (1821). The first gas company in America was established there in 1816. The construction of the first important line of railway in the United States, the Baltimore and Ohio railroad, was begun in Baltimore in 1828. Here, also, the first iron steamship was built. In 1844, the first electric telegraph line ever operated was strung between Baltimore and Washington. The first complete, practical electric street railway in the world was installed in Baltimore in 1888. Population, 1970, 905,759.

Bar Harbor. A summer resort in Maine, on the east shore of Mount Desert Island, which lies near the center of the state's coast line. Bar Harbor is partially within Acadia National Park. The scenery in the vicinity is enriched by mountains, by numerous small inlets on the coast, and by many picturesque lakes. Population, 1970, 3,716.

Baton Rouge (*băt'ŭn rōōzh'*). The capital of Louisiana, located on the east bank of the Mississippi River, about 85 miles northwest of New Orleans. The river is spanned at this point by a $10 million bridge. The city occupies a picturesque site on the river bluff, and receives additional charm from its sub-tropical foliage trees and old houses in the Spanish style. The imposing Capitol, dedicated in 1932, has a 33-story tower. South of the city on a 3100-acre campus is the State University. Baton Rouge also is the home of Southern University, said to be the largest and oldest primarily Negro university. By reason of its fine deep-water harbor, Baton Rouge carries on an extensive shipping trade. Its manufacturing interests include sugar and rice mills, wood-working factories, and extensive chemical and petroleum plants. Population, 1970, 165,963.

Battle Creek. A city of south central Michigan, situated about midway between Detroit and Chicago. The city lies in the center of a rich agricultural region and has become noted for its manufacture of cereals. Other manufactures include industrial trucks, valves, cartons, and therapeutic appliances. The Battle Creek Sanitarium is visited by thousands of persons yearly. Population, 1970, 38,931.

Bay City. A city of eastern Michigan, on the Saginaw River, some 4 miles from Saginaw Bay, an arm of Lake Huron, and about 100 miles northwest of Detroit. Bay City has excellent transportation facilities, both by rail and by water, the river being navigable for the largest lake vessels. The surrounding farming district produces large crops of sugar beets. Among the principal industries are automobile parts, electrical and other machinery, fabricated houses, cement, and beet sugar. Recreation facilities include the large Bay County Veterans Memorial Park. First settled in 1837, Bay City received its charter in 1865. Population, 1970, 49,449.

Bayonne (*bā'yŏn'*). An industrial city of New Jersey, situated on New York harbor 7 miles southwest of New York City. Bayonne is one of the world's most important centers for the refining of petroleum. It is the terminal of oil pipe lines leading to New York and other eastern cities. The Bayonne Port terminal offers docking facilities among the finest in the New York area. Population, 1970, 72,743.

Beaumont (*bō'mŏnt*). A deep-water port of southeastern Texas, on the Neches River, about 84 miles northeast of Houston. Beaumont is the center of an important rice growing district, and there are great oil fields and large pine and cypress forests in the vicinity. The chief industries are oil refining, lumbering, shipbuilding, and the cleaning and the marketing of rice. Beaumont is the seat of Lamar State College of Technology. Population, 1970, 115,919.

Bellingham. A port of northwestern Washington, located on a natural harbor on Bellingham Bay. It is the commercial center of an extensive agricultural, poultry and lumbering region. Salmon fishing is an important industry. The leading manufacturing establishments include lumber, pulp, and paper mills, salmon and fruit canneries, and cement and sugar beet factories. The city is the seat of the Western Washington State College. Population, 1970, 39,375.

Berkeley (*bûrk'lĭ*). A city of California, situated on San Francisco Bay opposite the Golden Gate and adjoining Oakland, which lies to the south. Berkeley's site overlooking the bay and the equable climate unite to make the city highly attractive from a residential point of view.

Berkeley is the seat of the University of California, the largest university in the world. Excellent transportation facilities and low-priced electrical power have favored the development of various industries. The manufactures include soap, toilet articles, drugs, inks and printing material, pastry products, and chemicals. Berkeley was first settled in 1868, and was incorporated as a town in 1878. Population, 1970, 116,716.

Bethlehem (*bĕth'lê-hĕm*; *-lê-ĕm*). A manufacturing city of eastern Pennsylvania, 52 miles northwest of Philadelphia. It is built on two hills separated by the Lehigh River. The leading industries are steel, foundry and machine products, and silk. Other products include flour, knit goods, radios, electrical equipment, and furniture. Founded in 1741 by Moravians, Bethlehem is the center of the Moravian sect in America. The city celebrates an annual musical festival which is sometimes styled the American Bayreuth. Bethlehem is also the seat of Lehigh University and Moravian College. Population, 1970, 72,686.

Billings. A city in southern Montana on the Yellowstone River, in the heart of an irrigated region noted especially for the raising of sugar beets. Tourist attractions include Beartooth National Forest, the Black Otter Trail, and the Yellowstone Historical Museum. Principal industries are oil refining and diversified manufacturing. Rocky Mountain and Eastern Montana colleges are located in Billings. Population, 1970, 61,581.

Biloxi. A city of Mississippi, about 12 miles east of Gulfport, on a peninsula extending into the Gulf. It is known as a seafood center, with extensive seafood canneries, as well as being a resort area. Biloxi is the site of Keesler Air Force Base and of Beauvoir, the last home of Jefferson Davis. At three times, Biloxi was the capitol of the French province of Louisiana. It was founded by the French in 1699. Population, 1970, 48,486.

Binghamton. A city located in a heavily industrialized area of New York, about 125 miles southwest of Albany. Binghamton is situated at the confluence of the Chenango and Susquehanna rivers. It is the seat of New York State University of Binghamton and Roberson Center for the Arts and Sciences. The birthplace of International Business Machines (IBM), Binghamton is also noted for its manufacture of shoes and photographic equipment and supplies. Binghamton was founded in 1800 by Joshua Whitney, land agent for William Bingham, a wealthy Philadelphia merchant and U.S. Senator from Pennsylvania. It was incorporated as a village in 1834 and became a city in 1867. Population, 1970, 64,123.

Birmingham. A city of Alabama, slightly north of the center of the state. Being situated in the midst of immense coal and iron deposits, Birmingham has risen to high rank among the iron and steel producing centers of the country. Steel and steel products and coke account for a high percentage of the city's extensive output of manufactures, although in recent years the industries of Birmingham have become considerably diversified. The tonnage of its freight is said to be greater than that of all the rest of the South combined. Birmingham is also the trade center of a large and highly productive agricultural district.

The city is substantially and handsomely built, and has many fine streets, beautiful residences, and imposing public buildings, and also numerous commercial structures of the skyscraper type. The municipal park system contains upwards of 39 public parks. Among the most prominent of these are Wilson, North Birmingham, East Lake, Lake View, and Highland parks.

Birmingham is a notable product of the industrial transformation that has taken place in the South since the Civil War. In 1870, the site of the city was a cotton field. In 1871, following the discovery of valuable coal and iron ore deposits in the vicinity, a land company founded Birmingham. Growth at first was slow, but the population rose from about 3000 in 1880 to more than 26,000 in 1890. Population, 1970, 300,910.

Bismark (*bĭz'märk*). The capital of North Dakota, situated on the east bank of the Missouri River, slightly southwest of the center of the state. The most notable buildings include the State Capitol and the Bismarck Civic Arena. The Missouri River is spanned at Bismarck by a bridge. The city's industries include printing, trucking, and the manufacture of farm machinery and concrete products. Population, 1970, 34,703.

Black Hills. A picturesque, mountainous region in South Dakota and northeastern Wyoming. Its 6000 square miles are rich in minerals, particularly gold, and embrace the Black Hills National Forest (970 square miles) and Custer State Park (168 square miles). The highest point is Harney Peak (7216 feet). On Mount Rushmore was begun in 1927 a huge memorial depicting in colossal sculpture the figures of Washington, Jefferson, Lincoln, and Theodore Roosevelt

Black Rock Desert. A dreary waste fully 70 miles long and in some places 20 miles wide, extending northeast from Pyramid Lake in northwestern Nevada. This area, which embraces nearly 1000 square miles, is an alkaline flat or sink, practically devoid of vegetation. During winter, portions are covered with shallow water, whence the name "mud lake," sometimes applied to the region.

Bloomfield. Located 4 miles northwest of Newark, New Jersey, and 11 miles west of New York City, Bloomfield was a part of Newark until 1812. The city is heavily industrialized, with such manufactures as paper and paper products, plastics, rubber goods, textiles, and tile. There is a Revolutionary War soldiers' training ground, now a park, in Bloomfield. Population, 1970, 52,029.

Bloomington. A city about 50 miles southwest of Indianapolis in Indiana. Bloomington is the center of a rich dairy farming region and of the limestone industry, with many quarries in the area. The city has various manufactures. Incorporated in 1876, Bloomington is the seat of Indiana University. Population, 1970, 42,890.

Blue-Grass Region. A district in central Kentucky, lying between the low plains of the west and the mountains on the east. This region is devoted largely to stock raising and is famous for its thoroughbred horses. It is so named because of the prevalence and fine quality of its blue-grass pastures, a common feature of the landscape.

Boise (*boi'sĭ*). The capital of Idaho, located on the Boise River in the southwestern quarter of the state. The surrounding country is rich in minerals and in agricultural products, and the city is an important inland wool market. The varied industries utilize hydroelectric power from the celebrated Arrowrock Dam, constructed 22 miles east of the city and having a height of 349 feet. Boise is unique among cities in possessing a natural supply of hot water from a flowing well. This is used for heating houses and in part for supplying one of the city's outdoor swimming pools. Population, 1970, 74,990.

BOSTON. The capital of Massachusetts, the chief city of New England, is situated on Boston Bay, at the mouth of the Charles and the Mystic rivers, about 230 miles northeast of New York City.

Site. The original site of Boston was a peninsula marked by three historic hills, Beacon hill, Copp's hill, and Fort hill, and contained about 780 acres. By leveling portions of the hills and by filling in various inlets and tidal marshes, this original area was gradually expanded to 1800 acres. The city now contains an area of more than 30,000 acres, or about 50 square miles.

Metropolitan District. Modern Boston consists of the city proper and of the populous metropolitan district of which it is the center. The cities of Somerville and Cambridge extend almost to the heart of Boston, and the fine suburb of Brookline lies almost wholly within the city. These are closely surrounded by other large suburban communities. The center of population in the state of Massachusetts lies within the metropolitan district.

Streets. The narrow, irregular streets, characteristic of the old town, now form but a small section of the North End, mainly an Italian center. The modern city contains about 700 miles of paved streets, which, in the newer districts, are handsomely laid out. Beacon Street, rich in historic associations, and Commonwealth Avenue, one of the finest boulevards in America, are representative of Boston's finest residential avenues.

Parks. Boston ranks high among American cities in the development of parks and playgrounds. This has two distinct phases, municipal and metropolitan. The municipal park system covers 3500 acres, or more than one-tenth of the city's total area. It embraces the historic Common, 48 acres in extent, set aside in 1634, now in the heart of the city, and includes a chain of parks in various other sections, connected by beautiful parkways. These almost encircle the city.

The Metropolitan parks district includes, with Boston, about 40 municipalities. These are administered by a state commission. The Metropolitan parks plan includes such reservations as the Middlesex Fells, 1900 acres; the Blue Hills, 4900 acres; Stony Brook Woods, 460 acres; and Lynn Woods, 2000 acres. The scheme embraces reservations with connecting parkways covering upwards of 10,000 acres.

Monuments. Boston is noted for its monuments and statues, embracing some of the finest sculptural work in America. The most striking is Bunker Hill Monument, a granite obelisk, about 220 feet high, in Charlestown. In the Common is the great Army and Navy Memorial, by Milmore, and the monument commemorating the Boston Massacre, by Kraus. In the Public Gardens is an equestrian statue of Washington, by Ball; and the Ether Monument, commemorating Dr. W. T. G. Morton's experiments, by J. Q. A. Ward. Facing the Capitol is the impressive Shaw Memorial by Saint Gaudens. There are many others.

Buildings. The newer portions of Boston contain some of the finest examples of modern architecture in the United States. Among many notable buildings may be mentioned the Capitol, the Public Library, Federal Building, Prudential Center, Trinity Church, Holy Cross Cathedral, the First Church of Christ Scientist, and the Museum of Fine Arts. The Customhouse, with a tower 505 feet high, is one of the landmarks of the city.

Educational Institutions. Boston is unsurpassed as an educational center. Among its leading institutions are Boston University, Boston College, Simmons College, the New England Conservatory of Music, the Harvard Medical and Dental schools, Northeastern University, and the art school in connection with the Museum of Fine Arts. Harvard University, Radcliffe College, and the Massachusetts Institute of Technology are located across the Charles River in Cambridge. Tufts College, Wellesley College, and other noted institutions are in nearby suburbs. Boston is the home of many important historic, scientific, literary, and musical societies. The Boston Symphony Orchestra is one of the leading organizations of its kind.

Transportation. In large measure, Boston owes its commercial prominence to excellent transportation facilities. It is the chief railway center of New England, and its harbor is one of the finest and best equipped on the continent. It has 8 miles of wharfage, giving 40 miles of berthing space.

Commerce. Boston is the chief seaport of New England and one of the foremost in the United States. The exports are chiefly provisions and manufactures of cotton, wool, leather, iron and steel, and rubber. Among the principal imports are wool, cotton, fibers, sugar, hides, tea, tin, wood products, and chinaware. There is an extensive coastwise trade, and the city has become the leading fish market in the United States. Among the world's wool markets, Boston ranks second only to London. As a chief distributing point for New England, Boston conducts an enormous wholesale trade. The city is also the center of immense mining, railway, and insurance interests.

Manufactures. As a manufacturing center, the Boston area ranks about tenth among the industrial regions of the United States. While no single industry predominates, the city is a leading center for the manufacture of boots and shoes, clothing, confectionery, cocoa products, books, textile and electrical machinery, edge tools, shipbuilding, and numerous specialties.

Points of Interest. Boston, with its environs, offers the traveler an immense number of points of historic and literary interest. Many of the more famous of the earlier buildings have been carefully preserved. Among these are Christ Church (Old North), dating from 1723, Faneuil Hall, the old statehouse, King's Chapel, and the Old South Meetinghouse. Bunker Hill Monument and the navy yard are within the city. In the environs to the northwest are Concord and Lexington, and farther away to the southeast are Plymouth and Plymouth Rock.

Many great writers and scientists lived in or near Boston, including Longfellow, Lowell, Emerson, Holmes, Hawthorne, Thoreau. Dana, Aldrich, Parkman, Prescott, Motley, and Agassiz. Numerous homes and other places of interest connected with the lives of these men are readily accessible.

History. In a large sense, the history of Boston is the history of New England. Founded in 1630 by Puritans under the leadership of Governor John Winthrop, it was made the capital of the Massachusetts Bay Colony, and has since remained the dominant center of New England. In 1704 the *Boston News Letter*, the first regular newspaper printed in America, began publication. In 1765 began the resistance to the Stamp Act, which culminated in the Revolution. In 1770 occurred the "Boston Massacre," and, in 1773, the famous "Boston Tea Party." At the beginning of the Revolution, Boston was occupied by British troops who defeated the colonists at the battle of Bunker Hill, 1775, but early in 1776 Washington forced the British to evacuate the town Boston received its charter as a city in 1822. During the greater part of the 19th century, Boston was regarded as the literary center of America. Population, 1970, 641,071.

Boulder. A city of northern Colorado, 30 miles northwest of Denver, at the foot of the Rocky Mountains. It is a research and development center, most notably in the area of atmospheric sciences. Manufactures include computer components, technical equipment for satellites, cutlery, and chemicals. The city owns 6000 acres of mountain park land, including Arapahoe Glacier, from which the municipal water supply is obtained. Boulder Canyon nearby possesses great scenic interest. The city is a noted summer and health resort, and is the seat of the University of Colorado. Population, 1970, 66,870.

Bridgeport. The chief manufacturing city of Connecticut, situated in the southwestern part of the state on a natural harbor of Long Island Sound. The city is noted for the diversity of its manufactures, which include electrical machinery, sewing machines, and airplanes. It first attained importance as the seat of the manufacture of sewing machines and as the headquarters of P. T. Barnum's circus. The park system includes Seaside Park, with its two-mile boulevard along the sea wall. The University of Bridgeport has cooperated with the American Shakespeare Festival Theatre to form the Shakespeare Institute, bringing cultural interest to the area. Bridgeport is also the seat of Sacred Heart University. Population, 1970, 156,542.

Brockton. A manufacturing city of eastern Massachusetts, about 20 miles south of Boston. Brockton was one of the largest shoe manufacturing centers in the United States. Other industries include the manufacture of elastic goods, shoe machinery, shoe blacking, nails, and tools. Brockton was settled in 1700, became a town in 1821, and a city in 1881. Population, 1970, 89,040.

Brookline. A town of eastern Massachusetts, on the Charles River, about 3 miles west of Boston. Brookline is chiefly a residential place and ranks among the most beautiful and wealthy suburban towns in America. It produces some manufactures, among which may be mentioned furniture, scientific instruments, and textile products. Brookline is the seat of Cardinal Cushing College and Hebrew Teachers College. Population, 1970, 58,886.

Brooklyn. See *New York*.

Brownsville. A city of southern Texas, located on the Rio Grande River. It is an important port of entry, tourist resort, industrial center, shipping point, and agricultural area. It has excellent transportation facilities, manufactures bricks, and cans fruits and vegetables grown in the surrounding area. Founded in 1848 on an old Mexican settlement, Brownsville was an important port during the Civil War. Population, 1970, 52,522.

BUFFALO. A city of New York state, situated at the eastern end of Lake Erie, 22 miles south of Niagara Falls. It occupies a commanding site facing westward on Lake Erie and the Niagara River, and southward to the valley of Buffalo Creek.

Streets and Buildings. The city is regularly laid out, with mostly broad streets crossing each other usually at right angles. There are, however, several great diagonal thoroughfares radiating from the commercial center.

Among the many fine edifices are the Federal Building, an impressive granite structure in the French Romanesque style; the County Courthouse; Buffalo and Erie County Public Library; the 32-story City Hall costing $7 million; New York State Building; the William J. Donovan State Office Building; Roswell Park Memorial Institute; the Liberty National Bank, Rand, Marine Midland Trust, Federal Reserve, and Tishman buildings; the 174th Infantry and the 106th Field Artillery armories; the Museum of Natural History and Science, the Buffalo Historical Society Building; the Albright-Knox Art Gallery, an excellent example of refined classical architecture; the modern Kleinhans Music Hall, a $8.7 million Memorial Auditorium; and Saint Joseph's Cathedral. In the adjoining suburb of Lackawanna is the beautiful Basilica of Our Lady of Victory, a national shrine of the Roman Catholic Church.

Parks and Monuments. The municipal park system consists of a chain of parks and parkways which nearly encircle the city, covering in all an area of more than 1250 acres. In these are golf links, lakes and ponds, and numerous other facilities for recreation. Delaware Park·365 acres, with an artistic blending of lake, field, and natural forest, ranks scenically among the leading American parks. The Front and Centennial park, two beautifully landscaped tracts, overlook the outlet of Lake Erie into the Niagara River.

The principal public memorials are the McKinley Monument in Niagara Square and the Soldiers' and Sailors' Monument in Lafayette Square. In Forest Lawn Cemetery, there are monuments in memory of the Indian-chief Red Jacket and of President Fillmore.

Educational Institutions. The chief educational institutions are the State University of New York at Buffalo, Canisius College, D'Youville College, the Buffalo Seminary, State University College at Buffalo, Roswell Park Memorial Institute, and the Buffalo Fine Arts Academy which runs the Albright-Knox Art Gallery. In nearby suburbs are Rosary Hill College in Snyder and Erie County Community College in Williamsville.

Transportation. Buffalo's unique situation on the Great Lakes, combined with highly developed transportation facilities, gives the city its rank as a world port. The harbor, protected by an immense breakwater, is one of the best on the Great Lakes. The New York State Barge Canal forms a continuous water route to the Hudson River. The Welland Canal, 20 miles northwest of Buffalo, gives water connection with Lake Ontario and the Saint Lawrence Seaway. A railroad bridge and the Peace Bridge for general traffic connect the city with Canada. Moreover, Buffalo is one of the most important railway centers of the nation, being served by 7 major railroads. Thus, by rail as well as by water, Buffalo is on the direct line of communication between the lake ports and the Atlantic seaboard. A segment of the New York State Thruway passes directly through Buffalo.

Commerce. In tonnage and in extent of traffic, Buffalo ranks with the leading American and European ports. The water-borne traffic from the West consists principally of grain, iron ore, flour, and general merchandise. Wheat is the chief commodity received, with iron ore second, the two constituting more than half of the total. The water-borne traffic to the West is comprised mostly of manufactured goods, sugar, and anthracite. The total value of goods entering and leaving the port exceeds a billion dollars annually. Besides this large lake and barge canal traffic, immense quantities of merchandise are received and distributed by rail. The city is an important center for the transshipment of grain, its grain elevators having a capacity of about 30 million bushels. Buffalo is also the general trade and wholesale distributing center of a large and highly populous region.

Manufactures. In manufactures, Buffalo usually ranks eighth among the cities of the United States. The city's industries are extensive and varied and their growth has been substantial and enduring. The production of iron and steel and various iron and steel products constitutes one of the chief industries. Storage and milling of grain have always been major activities along Buffalo's busy water front. Among other noteworthy manufactures are automobile parts, rubber tires, chemicals, food preparations, books, linseed oil, and furniture. Buffalo owes its eminence in manufactures to an abundance of electric power, to large supplies of natural gas, and other readily available fuel; and to unexcelled transportation advantages for the distribution of its products.

Points of Interest. The pre-eminent feature of scenic interest in the vicinity of Buffalo is Niagara Falls. There are also many points of historical interest in connection with the early settlement of the Niagara frontier and of the conflict with the British and Indians in the War of 1812–14.

History. La Salle visited the site of Buffalo as early as 1679. The first white settlement was made about 1788 by Indian traders. In 1801–02, a village called New Amsterdam was laid out at the mouth of Buffalo Creek. This village was incorporated and renamed Buffalo in 1810. Three years later it was captured and practically destroyed by the British. It was rebuilt but grew slowly until the completion of the Erie Canal in 1825. Since that date·

Buffalo's progress has been continuous and substantial. In 1832, Buffalo received its charter as a city. The first grain elevator in the world was built in Buffalo in 1843. The city has given to the United States two presidents, Millard Fillmore and Grover Cleveland. In 1901, the Pan-American Exposition was held at Buffalo. Population, 1970, 462,768.

Burbank. A city of southern California, 12 miles north of Los Angeles, noted for its motion-picture and aviation industries. Population, 1970, 88,871.

Burlington. A city of Vermont, located at the approximate center of the east shore of Lake Champlain. Among its manufactures are textiles, armament systems and components, dyes, and apparel. In the vicinity are large quarries of limestone. The city is the seat of the University of Vermont, chartered in 1791, Trinity College for Women, and St. Michael's College. It is headquarters of the Champlain Transportation Company, reputedly the oldest steamship corporation in the world. Greenmount Cemetery contains the grave of Colonel Ethan Allen. Population, 1970, 38,633.

Butte (*būt*). A city of Montana, situated in a mountainous region at an elevation of 5500 feet above sea level. Incorporated in 1879, Butte is the center of an extremely rich copper mining region. Recognition of the city's indebtedness to Marcus Daly, discoverer of the rich copper veins, is expressed in the form of a statue by St. Gaudens. The famous Anaconda mine, said to be the largest copper mine in the world, and many other valuable mining properties are located within a radius of a few miles. Besides copper, the principal product, manganese, gold, silver, lead, and zinc are obtained. The total value of the mineral output to date is approximately $2 billion. The city has an extensive local trade, entertains numerous tourists, and is the seat of the Montana College of Minerals and Technology. Population, 1970, 23,368.

Cambridge. A city of Massachusetts, situated on the Charles River opposite Boston. Cambridge is exceedingly rich in historical, literary, and educational associations.

The Washington elm, under which Washington took command of the American army, stood in Cambridge until 1923, when it was blown down. Elmwood Park commemorates the home of James Russell Lowell Craigie House, once the headquarters of General Washington, became the home of Henry Wadsworth Longfellow. Among the illustrious figures once resident in Cambridge were Oliver Wendell Holmes, Louis Agassiz, and John Fiske. The city is the seat of Harvard University, the oldest university in the United States, of Radcliffe College, of the Massachusetts Institute of Technology, and of the Andover Theological Seminary. A beautiful system of parks includes nearly the entire river front.

The city has numerous important industries, among which are printing and publishing, and the manufacture of electrical machinery, rubber goods, structural ironwork, chemicals, soap, candy, and bakery products.

Cambridge was settled in 1630 by Governor Winthrop and others as Newe Towne. In 1638, Newe Towne was renamed Cambridge; in the same year, Harvard College (founded in 1636) was opened. In 1639, the first printing press in English-speaking North America was set up in Cambridge. The first book printed here was "The Bay Psalm Book," which appeared in 1640. Population, 1970, 100,361.

Camden. A city of southwestern New Jersey, located on the east bank of the Delaware River, opposite Philadelphia. The city occupies a level site, covering an area of about 10 square miles. The park system contains Farnham Park and about 40 other parks or playgrounds. Among the leading industries are shipbuilding and the manufacture of radios, phonographs, canned soups, and worsted goods. Other important manufactures include iron and steel forgings, foundry products, linoleum, chemicals, and pens. In the suburbs are immense market gardens. The city is connected with Philadelphia by steam ferries and by two great bridges: one, the Benjamin Franklin bridge, on its completion in 1926, was the greatest suspension bridge in the world; the other, the Walt Whitman bridge costing $86 million, was opened in 1957.

First settled by Quakers, Camden was organized and named in 1773, and became a city in 1828. Population, 1970, 102,551.

Canaveral, Cape. See *Kennedy, Cape.*

Canton. An industrial city of northeastern Ohio, famed for its manufacture of roller bearings and other iron and steel products, particularly those made from stainless steel. Second only in importance to its metal-working plants are its brick and tile factories. Canton was the home and is the burial place of President McKinley, in whose honor a national memorial has been erected in West Lawn Cemetery. The first home of the National Football League, Canton is now the seat of the Professional Football Hall of Fame. Population, 1970, 110,053.

Carlsbad Caverns National Park. A cavern in southeastern New Mexico, believed to be the largest and deepest in the world. It is entered at the foot of a cliff in the Guadalupe Mountains about 20 miles south of Carlsbad, New Mexico, and 130 miles east of El Paso, Texas.

The cave was formed by water filtering through overlaid rocks and slowly dissolving out beds of rock salt, limestone, and gypsum. The dripping water carrying dissolved minerals has formed stalagmites and stalactites of unrivaled beauty. One of the most impressive portions is the "Big Room," about 4000 feet long with a maximum width of 625 feet. At one point the ceiling is 300 feet high. The "Giant Dome" resembles the leaning tower of Pisa. It is estimated to be 60 million years old. The lowest known point in the cave is some 1350 feet below the earth's surface.

The cave is known to extend at least 25 miles, approximately a third being accessible to the public over carefully marked trails. Artistically concealed electric flood lights emphasize the natural beauty of the cavern. The temperature is constant throughout the year at 56°F.

The most interesting feature of animal life within the cave is a huge colony of bats, estimated to number 3 million, which issues forth from the entrance each evening of summer like a thick cloud. It was this cloud of bats which led to the discovery of the cave in 1901 by Jim White, a cowboy. Milk-white crickets have been found in the cave.

In 1923, an area of about 719 acres surrounding the mouth of the cavern was set aside as a national monument. This was made into a national park in 1930, and its area was subsequently enlarged to about 73 square miles.

Carson City. The capital of Nevada, picturesquely located near the foot of the Sierra Nevada, 14 miles from Lake Tahoe. It contains the Capitol, a Federal building, and a museum containing a series of mastodon skeletons which were discovered nearby. In the vicinity are the State Penitentiary and a government Indian school. Population, 1970, 15,468.

Casa Grande (*kä'sä grän'dā*). The remains of a prehistoric building, situated near the south bank of the Gila River, about 12 miles west of Florence, Arizona. The first white man to visit this impressive structure was Father Kino, a Jesuit missionary. In 1694, he said Mass there. It became a national monument in 1918.

The principal edifice is about 45 by 60 feet in extent. The height of the walls indicates that there were at least three stories, each having various rooms. Above the third story was a smaller room, apparently a watch tower. This structure is only one of many blocks of buildings whose former existence nearby is marked by mounds of debris.

The exterior walls of the Casa Grande building are rough and very much eroded. The interior walls, however, are smoothly plastered. The structure is built of a natural cement, called *caliche* by the Mexicans, composed of lime, earth, and pebbles. This was made into blocks laid in courses.

Casa Grande was probably built about 1350 by the Salado Indians and was occupied by them and the Hohokams for nearly a century before being abandoned.

Casper. A city of Wyoming, in the east central part of the state, on the North Platte River, 150 miles northwest of Cheyenne. It is the site of Fort Caspar, and has extensive commercial interest in the cattle, sheep, wool, and petroleum produced in the surrounding districts. The refinement of petroleum is the chief industry. Casper owns a 440-acre mountain park 5 miles south of the city. Population, 1970, 39,361.

Castle Gate. The entrance to Price River Canyon in central Utah, 115 miles southeast of Salt Lake City. This gatelike passage is formed by two immense pinnacles of sandstone, 450 to 500 feet in height. These pinnacles, strikingly colored, rise like two castles sheer from the narrow canyon bed, barely leaving room for the railway and the river to pass.

Catskill Mountains. A group of mountains in the southeastern portion of New York State about 100 miles north of New York City. The system is about 50 miles long, north and south, and has a breadth of some 30 miles. The highest peak is Slide Mountain, 4204 feet in elevation. In order to supply New York City with water, two creeks on the southern slopes of the Catskills have been impounded: the Esopus by the Ashokan Dam and the Schoharie by the Gilboa Dam. From the resulting reservoirs, which connect by the 18-mile Shandaken tunnel, water is conveyed to New York City by the Catskill aqueduct, which includes a 17-mile tunnel.

Cedar Rapids. A manufacturing city and railway center of east central Iowa, situated on the Cedar River, 220 miles west of Chicago. Its 200 industries include meat packing and the manufacture of cereals, corn products, machinery, and electronic equipment. In total value of manufactures, Cedar Rapids ranks first among the cities of the state. The city is the mercantile center for a rich agricultural region, and enjoys an extensive wholesale trade. The first settlement was made in 1838 at the rapids of the Cedar River. These furnish the water power which has been an important factor in the city's growth. Cedar Rapids is the seat of Coe College. Population, 1970, 110,642.

Champaign. A city in a rich agricultural region of Illinois, about 127 miles southwest of Chicago. It adjoins Urbana, Illinois, Urbana being primarily a residential area, and Champaign, an industrial and commercial area. The University of Illinois is located in Urbana. Champaign manufactures drop forgings, soybean oil, road machinery, deep freezers, air conditioners, and many other items. Population, 1970, 56,532. Population of Urbana and Champaign, 89,332.

Champlain, Lake. An important lake, lying between New York and Vermont, draining through the Richelieu River into the Saint Lawrence. Lake Champlain is about 110 miles long and, at its broadest northern portion, about 13 miles wide. It has a total area of about 600 square miles, two-thirds of which is in Vermont. Its greatest depth is about 300 feet, and it is navigable for the largest vessels.

Lake Champlain is connected with the Hudson River by a canal from Whitehall and serves as a link in New York's extensive system of inland waterways. Among the towns along its shores are Rouses Point, Plattsburg, Port Henry, Crown Point, and Whitehall in New York, and Burlington in Vermont.

Discovered by Champlain in 1609, the lake and its environs became the scene of many stirring events in the French and Indian War and in the Revolutionary War. The decisive naval battle of Lake Champlain was fought off Plattsburg in 1814.

Charleston. The only seaport city of South Carolina, situated 7 miles from the ocean on a peninsula between the Ashley and Cooper rivers. The estuary of these rivers forms a fine landlocked harbor—one of the deepest and most spacious on the Atlantic coast.

The attractive appearance of the city is enhanced by such features as Washington Park, with its pre-Revolutionary statue of William Pitt; Hampton Park; the Customhouse, built of white marble at a cost of $3.4 million; White Point Gardens; and the Esplanade, comprised of the broad, beautiful promenade of the Battery seawall drive.

Manufacturing in Charleston County is widely diversified, including products of wood, metal, tobacco, concrete, paper, asbestos, rubber, chemicals, plastics, and fabrics. An average of more than one hundred ships per month enter and leave the Port of Charleston, and the value of imports and exports is in excess of $200 million annually. Wool is a very important item, with two large wool scouring plants nearby. The port facilities, being fully modernized, handle everything from heavy machinery to tropical fruits. Charleston is one of the country's leading banana ports.

The vicinity of Charleston was the scene of the earliest attempts at colonization in South Carolina. A temporary settlement was made by the French in 1562. The first settlement on the present site of the city was made by English colonists in 1670, who were joined in 1686 by groups of Huguenot refugees. In 1755, a colony of 2000 deported Acadians settled in Charleston.

During the American Revolution, Charleston was captured by the British. The city suffered immense damage in the final campaign of the Civil War in 1865. On August 31, 1886, a heavy earthquake caused great destruction of life and property. After each period of devastation, the city was rebuilt more substantially than before. Charleston has preserved, to a remarkable degree, her interesting historic places and features.

Possessing a well-equipped navy yard, Charleston is an important center of military activity. Located in the immediate vicinity are the Minecraft Base, the Charleston Air Force Base, the U.S. Naval Ammunition Depot, and the U.S. Army Transportation Corps Depot. The system of harbor defenses includes Fort Sumter, whose bombardment in 1861 marked the beginning of the Civil War.

Among the city's leading educational institutions are the College of Charleston, the Medical College of South Carolina, and the Citadel, or State Military College. Population, 1970, 66,945.

Charleston. The capital of West Virginia, situated at the junction of the Kanawha and Elk rivers in a region rich in coal deposits and in petroleum and natural gas. In addition to steel manufactures the city has become noted as a source of nylon, synthetic rubber, resin, and various other chemical products, particularly those having to do with defense. The ready accessibility of silicon, salt brine, and coal-tar products has made this a natural location for such industries. The city's increased activity has been reflected in the completion of the Kanawha County Airport, located on Coonskin Hill. A local educational institution is Morris Harvey College. Charleston was incorporated in 1794, and became the capital of the state in 1870. Population, 1970, 71,505.

Charlotte (*shär'lŏt*). A cotton manufacturing city of North Carolina, located in the rich cotton growing district of the southwestern part of the state. It is at the heart of the hydroelectrical development in the state, and, besides cotton textile mills, has dye and engineering works and automobile assembly plants. The city has a monument erected to the memory of those who, at Charlotte in 1775, signed the Mecklenburg Declaration of Independence. The leading educational institution is Queen's College. Charlotte is the birthplace of President Polk. Population, 1970, 241,178.

Charlotte Amalie. The capital of the Virgin Islands, on the southern side of the island of Saint Thomas, about 40 miles east of Puerto Rico and 1440 miles southeast of New York. Situated on Saint Thomas harbor, one of the finest in the Antilles, it commands strategically the important Virgin Passage.

Charlottesville. A city of central Virginia, built on the Rivanna River, about 70 miles northwest of Richmond. Charlottesville is the seat of the University of Virginia. This was founded by Thomas Jefferson, whose home at Monticello is only 3 miles distant. The city is beautifully located in a rich agricultural and fruit growing region. It was settled in 1744, and the vicinity abounds in historical associations connected with the Revolutionary War. Population, 1970, 38,880. See *Monticello*.

Chattanooga (*chăt'ă-nōō'gă*). A railroad center and manufacturing city of southeastern Tennessee, situated on the south bank of the Tennessee River. Nearby deposits of coal and iron together with abundant hydroelectric power, marketed at low cost by the Tennessee Valley Authority, facilitate the operation of many industries. Of these, the most important are the manufacture of steel, steel products, and textiles. Near the city stands Lookout Mountain, from whose summit seven states can be seen. Several important battles of the Civil War were fought in the vicinity of Chattanooga. The educational institutions include the University of Tennessee at Chattanooga and the Chattanooga State Technical Institute. Population, 1970, 119,082.

Chautauqua (*shă-tô'kwă*) **Lake.** A small lake in the extreme southwestern part of New York. It is about 18 miles long and 2 miles wide, and drains through Conewango Creek into the Allegheny River. It lies about 1300 feet above sea level, and 730 feet above Lake Erie, which is only a few miles distant but separated by a range of hills. Chautauqua Lake is noted for its beautiful surroundings and for the widely known Chautauqua summer school located on its banks.

Chelsea (*chĕl'sē*). A city of eastern Massachusetts, situated on the Mystic River, about 3 miles northeast of Boston. Chelsea has substantial industries. These include the manufacture of lithographs, shoes, paper, car wheels, and rubber products. First settled in 1642, as Winnisimmet, Chelsea was incorporated under its present name in 1739. In 1908, a great fire destroyed a large portion of the city. The devastated area, however, was rapidly rebuilt. Population, 1970, 30,625.

Chester. A manufacturing city of southeastern Pennsylvania, located on the Delaware River, about 13 miles southwest of Philadelphia. The chief industrial interests include steel products, munitions, locomotives, automobiles, chemicals, paper, petroleum, machinery, and textiles. It has also one of the largest shipbuilding yards in the country. The city has three parks, also the Deshong Memorial grounds. It is the seat of Pennsylvania Military College. Chester was first settled about 1640 by Swedes. Of historic interest are the City Hall, built in 1724, and the house of William Penn. Population, 1970, 56,331.

Cheyenne (*shī-ĕn'*). The capital of Wyoming, site of America's first ICBM base, is situated in the southeast part of the state, 106 miles north of Denver. The city was founded in 1867 by engineers of the Union Pacific railroad. Because of its central location in an extensive stock-growing section, the city is an important shipping point for beef cattle and for sheep. Among the chief buildings are the State Capitol, the Federal Building, and the governor's mansion. A three-mile boulevard extends from the city to Fort Francis E. Warren, an important government military post. Population, 1970, 40,914.

CHICAGO. The chief city of Illinois, the metropolis of the Middle Western states, and the second most populous city in the United States. It is situated on the southwestern shore of Lake Michigan and on the Indiana boundary, about 185 miles northeast of Springfield, the capital of the state.

SITE. Chicago occupies a remarkably level site, extending along the lake shore for 24½ miles. The city extends inland, at its widest point, for a distance of about 10 miles and embraces a total area of some 212 square miles.

By the Chicago River, a small stream, and by its two branches, the city is divided into three principal districts. The branches of the river unite about a mile west of the lake and approximately midway between the north and the south boundaries of the city. The district lying north of the river and the north branch is called the North Side; that lying south of the river and the south branch is called the South Side; and the much larger district lying west of the two branches is known as the West Side.

STREETS. With few exceptions, Chicago's streets cross at right angles and in east-and-west and in north-and-south directions. Chicago is noted for its exceedingly long and straight streets. Many continue in a direct line for from 5 to 10 or more miles. Some, as, for example, Western Avenue and Halsted Street, extend without deviation for practically the entire length of the city, a distance of 25 miles.

The chief commercial and mercantile center lies south of the river between its south branch and the lake. Here, in an area approximately a mile square, are found most of Chicago's great public edifices, office buildings, and department stores. Many of these are grouped within the so-called "loop," a section surrounded by elevated railroads. On the north it is bounded by the two-level Wacker Drive. State Street contains the great department stores, and, with Wabash and Michigan avenues, constitutes the chief shopping district. LaSalle Street, the center of the financial district, is sometimes styled the "Wall Street" of Chicago. Franklin and Market streets are the principal center of the wholesale trade. The most notable street of the commercial district is Michigan Avenue. For more than a mile this overlooks Grant Park, and its massive buildings, when viewed from Lake Michigan, dominate the city's sky line. Extending northward over the Link Bridge, which spans the Chicago River, it becomes the beautiful Lake Shore drive.

BUILDINGS. Near the center of the business district is the magnificent Civic Center. This is a twin structure of limestone and granite, built in the French Renaissance style. The United States Courthouse, one of the largest structures erected by the United States government outside of Washington, covers an entire city square, about 320 by 400 feet. It is built of granite, 16 stories high, and is surmounted by a massive dome nearly 300 feet high. The Field Museum, on the lake front, erected at a cost of $8 million, ranks among the finest museum buildings of the world. Nearby, on an artificial island, is the Adler Planetarium, the first to be erected in America (1930). Among other notable structures are the Public Library, the great stadium, on West Madison street, the Municipal Pier, the Wrigley Building, the Tribune Tower, the Pure Oil Building, the Board of Trade Building, the Field Building, the Hilton Hotel, the Merchandise Mart, and a $21 million Post Office.

PARKS AND MONUMENTS. Chicago has a magnificent park system embracing about 486 large and small parks, with a total area of more than 7300 acres. The major parks are connected by a system of boulevards and parkways, aggregating 162 miles in length. The circuit through the park system affords one of the finest drives in America. The larger units of the system are Lincoln, Humboldt, Garfield, Douglas, Marquette, Washington, Jackson, Burnham and Grant parks. Among the parkways and drives which link these units into one organic whole are Lake Shore Drive, Sheridan Road, the Outer Drive, and Diversey Avenue on the North Side; Humboldt, Jackson, and Washington boulevards on the West Side; and Eriksen Drive, Michigan Avenue, Grand, Drexel, South Shore Drive, and Garfield Boulevard on the South Side.

Grant Park, on the lake, in front of the business district, contains the Art Institute and the beautiful Buckingham Fountain. Lincoln Park contains a large conservatory and zoological garden and notable statues of Grant and Lincoln, the latter an impressive work by Saint Gaudens.

Jackson Park, the largest of all, overlooks the lake on the South Side. Along the Midway plaisance, connecting Jackson and Washington parks, are the buildings of the University of Chicago. In this plaisance is the impressive sculptural group "Fountain of Time," by Lorado Taft.

Besides the extensive recreation grounds within the city, a metropolitan park district has been created outside of the city. For the purpose of establishing an outer ring of parks, several large forested areas, aggregating more than 37,800 acres, have been purchased.

EDUCATIONAL INSTITUTIONS. Chicago is one of the important educational centers of the country. It is the seat of the University of Chicago, noted for its large post-graduate school. Northwestern University, in the adjoining suburb of Evanston, has most of its professional departments in the city. Other important institutions are Loyola University, De Paul University, the Illinois Institute of Technology, the Lewis Institute, and the art school in connection with the Art Institute.

TRANSPORTATION. Chicago is the chief railway center of America, being the terminus of railway systems embracing about half the total railway mileage of the country. No railroad runs through Chicago, for all of the 22 trunk lines, radiating to all parts of the United States, have terminals in the city. The business district is surrounded by a ring of great passenger stations. A series of belt lines around the city connects the different railroads, forming a complete transfer system. Chicago's 640-acre O'Hare airport is the terminus of numerous converging airplane routes. Meigs and Midway airports are also located in Chicago.

Chicago has also the advantage of inland water transportation, and ranks as one of the chief ports on the Great Lakes. There is a well protected harbor, with docking facilities furnished by the Municipal pier, which extends 3000 feet into the lake. The river and its branches have been deepened so that an immense tonnage, greater than that passing through the Panama Canal, is handled at wharves within the city. By the construction of the Chicago drainage canal, whereby the waters of the river are made to flow outward from the lake into the Des Plaines river, an all-water route to the Mississippi and to the Gulf of Mexico has been made possible.

Local transportation is served by an extensive system of elevated electric railway. The elevated railways radiate from the central loop in the commercial district to all sides of the city. In addition, there is an extensive system of motor bus transportation. Chicago is served also by a large number of suburban electric lines.

COMMERCE. Chicago owes its supreme position in American inland commerce to superior advantages of location and to marvelously developed facilities for transportation. It is situated at the crossroads between the populous industrial sections of the northeastern states and the rich agricultural districts of the Mississippi valley and the great Northwest. The city is the center of shipment of western produce to the East and of eastern manufactures to the West. It is the greatest distributing point in the United States for dry goods, foodstuffs, clothing, household articles, and general merchandise. In Chicago was developed the now extensive business of mail order merchandising.

MANUFACTURERS. Chicago is the industrial as well as the commercial metropolis of the Mississippi Valley region. Among American cities, it stands second only to New York in value of manufactures. Chicago's manufactures normally exceed $3.5 billion in value, or more than two-thirds that of New York's manufactures. Chicago is the world's greatest meat packing center, and leads the country in the manufacture of farm implements, farm machinery, and railroad cars. Its other industries are extensive and exceedingly varied.

HISTORY. In 1803, John Kinzie, the first American settler, built a house on the north bank of the river. In 1804, Fort Dearborn was erected. During the War of 1812, this fort was captured and the settlers massacred by the Indians. Fort Dearborn was reconstructed in 1816, but the village around it grew very slowly until the building of the Illinois and Michigan canal in 1830.

Made a town in 1833, Chicago was incorporated as a city in 1837 with a population of 4170. In 1852, the first railway from the East reached Chicago. Following this event the city's growth was rapid, rising from 28,000 in 1850 to 109,000 in 1860, and to 298,000 in 1870. Since 1870, Chicago has increased in population at the rate of more than a half million in each decade.

In 1871 occurred the "great fire," the most appalling disaster that as yet had befallen an American city. Within a few years the devasted areas were rebuilt and made more substantial than before. In 1893 was held the World's Columbian Exposition, erected at a cost of about $43 million. The centennial of Chicago's incorporation as a town was celebrated by the Century of Progress Exposition in 1933. Population, 1970, 3,366,957.

Chicopee. A manufacturing city of southwestern Massachusetts, located on the Connecticut River, at the mouth of the Chicopee, about 4 miles north of Springfield. Abundant water power is furnished by the Chicopee River for the city's varied and extensive industries. These include the manufacture of firearms, cotton and knit goods, bronze statuary, knitting machines, rubber goods, athletic goods, regalia, swords, and many other articles. Westover Air Base is located nearby. Population, 1970, 66,676.

Chillicothe (*chĭl'ĭ-kŏth'ē*). Capital of the former Northwest Territory and once capital of Ohio, Chillicothe is situated on the Scioto River 45 miles south of Columbus, in the middle of a rich agricultural region. It is also in the center of the Mound City group of prehistoric earthworks which have yielded many artifacts revealing some early American civilization. Chillicothe's manufactures include aluminumware, paper and paper products, shoes, and floor tiling. Camp Sherman was built here during World War I. The city is the site of the Chillicothe Correctional Institute and a U.S. Veterans' hospital. Population, 1970, 24,842.

Cicero. A town of Illinois, partially surrounded by Chicago, of which it is an industrial suburb, being about 7 miles west of Chicago's "loop." Manufactures comprise chiefly electrical equipment, pumps, engines, iron castings, and enamel ware. Population, 1970, 67,058.

CINCINNATI (*sĭn'sĭ-năt'ĭ*). A city in Ohio, situated on the north bank of the Ohio River, 120 miles southwest of Columbus.

Site. Cincinnati is environed by a semicircular range of high hills. From the river bank, it rises in two great terraces or steps, finally reaching a height of 450 feet above the river. Several fine bridges connect the city with Covington, Newport, Ludlow, and other towns on the Kentucky side. Through the center of the city passes Central parkway, a 4½-mile boulevard on the site of the old Miami and Erie canal. The picturesque residential sections of Mount Auburn, Mount Adams, Fairview, Avondale, Hyde Park, College Hill, and Clifton are reached by motor bus lines and by splendid highways.

Buildings and Institutions. Among the more notable buildings are the Post Office, the Public Library, the Music Hall, the County Courthouse, Carew Tower (48 stories, 574 feet high), the Union Central Life building (34 stories, 495 feet high), Saint Peter's Cathedral, and a magnificent terminal station costing about $42 million. Of public monuments, the most artistic are the Tyler-Davidson Fountain, in Fountain Square, and the Barnard Lincoln statue, in Lytle Park. The extensive park system, embracing over 2800 acres, includes Mount Airy Forest, Eden Park, Burnet Woods, Ault, Mount Echo, and various smaller parks.

The city has been long known as an educational, art, and musical center. Among the principal institutions are the University of Cincinnati, a state university; the Ohio Mechanics' Institute; the Art Academy and Art Museum, in Eden Park; Saint Xavier University; Hebrew Union College, Our Lady of Cincinnati College; and the Cincinnati College Conservatory of Music. For many years the May Musical Festivals, held annually, and the annual season of summer opera at the municipally owned Zoological Gardens, have been an indispensable feature of the city's cultural life. The widely known Cincinnati Symphony Orchestra is a well-endowed, permanent organization.

Manufactures. Cincinnati ranks high as a manufacturing city, and owes much of its success as such to its advantageous location midway on the great Ohio River. In addition, the city has the service of eight trunk lines of railway, one of which, the Cincinnati Southern, 338 miles long, is owned by the municipality itself. It is an important air-route center and is an outlet for the bituminous coal fields of Kentucky and West Virginia and for fruits and vegetables grown in the South. Cincinnati's most important manufactures include machine tools, playing cards, soap, building materials, cans, chemicals, clothing, coffins and burial cases, conveyors, cosmetics, electric motors, food products, jet engines, malt and distilled liquors, mattresses, motor vehicles and parts, paper, pianos and organs, plastics, inks, meat products, printing, metal products, shoes, and ceramic products, including the famous Rockwood pottery.

History. In 1788, a village called Losantiville was laid out on the present site of the city. The name of this village was changed in 1790 to Cincinnati, which, in 1802, became incorporated as a town. Its steady growth dates from 1816, when steam navigation was inaugurated on the Ohio River. Cincinnati was incorporated as a city in 1819. Few large cities in the United States have a larger proportion of native-born inhabitants. Population, 1970, 452,524.

Citrus (*sĭt'rŭs*) **Belt.** The name applied to those parts of the states of California and Florida in which the leading citrus fruits—oranges, lemons, and grapefruit—are chiefly produced. Many counties in various parts of California grow oranges on a small scale, but by far the largest part of the state's commercial crop of all citrus fruits is grown in seven counties in the southern part of the state. These are Los Angeles, San Bernardino, Orange, Tulare, Riverside, Ventura, and San Diego counties. Santa Barbara County is an important producer of lemons, and, farther north, Fresno, Sacramento, Butte, Tehama, and Glenn counties produce and market substantial quantities of oranges.

The citrus belt of Florida comprises about 15 counties in the central part of the peninsular portion. It extends across the state from the Gulf of Mexico to the Atlantic Ocean, its center lying a short distance north of Tampa. In this belt the chief citrus fruits produced are oranges and grapefruit. The leading counties in the production of oranges are Polk, Orange, DeSoto, Brevard, Lake, Hillsborough, Volusia, and Pinellas. These counties produce about two-thirds of the total orange crop of the state. The counties leading in grapefruit are Polk, Manatee, Pinellas, Lee, DeSoto, and Saint Lucie. These counties produce about two-thirds of Florida's total yield of grapefruit.

California produces practically all of the lemons, about 70 per cent of the oranges, and some 13 per cent of the grapefruit grown in the United States. Florida grows about 60 per cent of the grapefruit and about 28 per cent of the oranges produced in the country. Texas and Arizona also rank high in grapefruit production, each growing between 10 and 20 per cent of the nation's crop.

Clarksburg. A trade center in the north central part of West Virginia. Among various manufactured products it is noted for articles made of glass, particularly glass tumblers. Clarksburg was founded in 1782. It is the birthplace of "Stonewall" Jackson, after whom one of its leading hotels is named. A Veterans' hospital was opened in 1951. Population, 1970, 24,864.

CLEVELAND. The chief city of Ohio, situated on Lake Erie at the mouth of the Cuyahoga River. It is located in the northeastern part of the state, about 625 miles by rail northwest of New York, and some 360 miles east of Chicago.

Site. Cleveland occupies a beautiful site on elevated ground sloping gently toward the lake, along which it has a frontage of 14 miles. The city is divided unequally by the windings of the Cuyahoga River into a larger portion on the east side and a smaller portion on the west side. The highest point reaches an elevation of about 300 feet above the level of the lake; the lowest points are in the valley of the river and along the lake shore. Immense viaducts, spanning the deep valley of the river, connect the eastern and the western sections. Among the most notable of these are the High Level and Main Avenue bridges and the Abbey Street, Clark Avenue, Lorain-Central, and Harvard-Denison viaducts.

Streets and Buildings. Cleveland is well laid out with many broad, well shaded streets and handsome boulevards. At the intersection of Superior Avenue and Ontario Street, in the heart of the city, is the Public Square. There are also streets connecting with the great viaducts leading to the west side of the city. The chief business section extends from the lower part of the river eastward. The manufacturing districts are mostly along the lake front, in the low flat valley of the river, and along various lines of railway.

A notable architectural feature in the heart of the city is the array of buildings forming the "Municipal Group," or civic center. The project, designed by leading American architects, includes the erection of structures of beautiful and harmonious architecture on a T-shaped tract of land, known as the Mall. The buildings include the County Courthouse, the City Hall, the Federal Building, the Auditorium, the Board of Education Building, and the Public Library. The city is noted for its superb office buildings. Among noteworthy structures are the Museum of Art, the Auditorium, the Keith Building, Federal Reserve Bank, the Union Station with its associated buildings, including the 708-foot Terminal Tower building, the Medical Arts Building, and the Builders Exchange.

Parks. Cleveland's public park system covers a total area of about 3000 acres and includes upwards of 40 miles of connecting boulevards. Important units in the park system are Gordon, Edgewater, Brookside, Garfield, Monumental, Washington, Rockefeller, Wade, and Woodland Hills parks. Among attractive drives are Euclid Avenue, Fairmont and Shaker boulevards on the east side and, on the west side, Lake Avenue and Clifton Boulevard. About the three landward sides of the city extends a belt of boulevards and natural park lands, known as Metropolitan Park.

Educational Institutions. Prominent among Cleveland's cultural institutions are Case-Western Reserve University, John Carroll University, Cleveland State University, Fenn College, the Museum of Art, and the Museum of Natural History. Unique as a means of public education is Cleveland's "Health Museum." In 1949, two new theaters were constructed in the city by nonprofit groups. The Cleveland Orchestra is nationally known.

TRANSPORTATION. The harbor, which is protected by an immense breakwater nearly 6 miles long, is one of the most spacious on the Great Lakes. There is a total lake dock frontage of more than 13 miles, and the Cuyahoga River is also lined with docks. These are equipped with facilities for handling iron ore, coal, and lumber, and there is ample dockage at special piers for the extensive passenger service. Cleveland is also one of the great railway centers of the country, with direct lines to most of the leading cities of the United States. It is also an important point of transcontinental air routes. To its already commodious airport facilities for large commercial craft, the city has added a lake-front landing field for light planes.

COMMERCE. Cleveland owes its commanding position in commerce and industry to superior advantages of location. It is situated at the economic focus for the assembly of the raw materials of iron and steel. It is said to be the largest ore market in the world. Within a short distance to the southeast lie iron mines, limestone quarries, and immense coal fields. From the northwest, by cheap all-water transportation, are received enormous supplies of Lake Superior iron ore. In consequence, the city's railways and lake steamer lines handle an immense tonnage of raw materials and distribute manufactured products valued at hundreds of millions of dollars. It is estimated that the total shipments handled at Cleveland aggregate in value more than a billion dollars annually.

MANUFACTURES. Cleveland is one of the great manufacturing centers of America. It ranks fifth among the cities of the United States, being surpassed only by New York, Chicago, Philadelphia, and Detroit. While there is an immense diversity of manufactures, the chief industries are concerned with the manufacture of iron and steel and their products. Other important manufactures are automobile parts, machine tools, household appliances, packed meats, clothing, electrical machinery, and refined petroleum. The Standard Oil Company, which began its operations in Cleveland, has immense refineries in the city. Cleveland is one of the greatest wire and bolt manufacturing centers in the world.

HISTORY. Cleveland was laid out in 1796 and was incorporated in 1814. In 1818, the first newspaper began publication. The Ohio Canal was opened to Akron in 1827, and in 1832 was completed to the Ohio River. This stimulated the growth of Cleveland, which received its city charter in 1836. Since the discovery of iron ore in the Lake Superior region and the construction of the first railroads, 1850–60, Cleveland's growth has been rapid and continuous. The centennial of its status as a city was celebrated by the Great Lakes Exposition in 1936. Population, 1970, 750,903.

Cleveland Heights. A city of northeastern Ohio, being a residential suburb of Cleveland, which it adjoins at Cleveland's eastern boundary. Between 1920 and 1930 it increased in population from 15,236 to 50,945. Population, 1970, 60,767.

Cohoes (*kō-hōz'*). A manufacturing city of eastern New York, located on the Hudson River and the State barge canal, at the mouth of the Mohawk River, about 9 miles north of Albany. Abundant water power and hydroelectric power have led to the development of extensive industries. Cohoes leads all other cities of the United States in the manufacture of knit underwear. Other industries include the manufacture of paper products, shirts and collars, machinery, and building materials. Population, 1970, 18,613.

Colorado Desert. An arid region in southeastern California. It is separated from the Mojave Desert, which lies to the north, by the San Bernardino and the Chocolate ranges, and is bounded on the south by the San Jacinto, the Santa Rosa, and the Superstition mountains.

From the eastern entrance of San Gorgonio pass, the desert extends to the Colorado River, from which it takes its name. It is more than 100 miles long, in some places more than 20 miles wide, and covers an area of about 2000 square miles. Much of this region lies below the sea level. The lowest portion is known as the Salton Sink. In this lies the salt lake, called the Salton Sea, the surface of which is about 280 feet lower than that of the Gulf of California. Parts of the desert show traces of volcanic activity, and there are mud volcanoes and numerous thermal springs.

As in the case of the Mojave Desert and Death Valley, lofty mountain ranges on the west cut off the vapor-laden breezes from the Pacific. Consequently, the Colorado desert is a region of extreme aridity,—in fact, one of the driest and hottest in the world. The normal rainfall ranges from 3 to 4 inches, and summer temperatures as high as 130° have been recorded.

The scanty vegetation is typical of southwestern deserts, it includes the creosote bush, mesquite, cat's-claw, smoke tree, paloverde, and numerous kinds of cactus. In a few canyons at the western end of this desert are the only known groves of the native American fan palm, or Washington palm. Among characteristic desert animals are the chuckwalla lizard and the sidewinder, or horned rattlesnake.

Wherever irrigation is practicable, much of this seemingly worthless desert will produce immense crops of fruits, alfalfa, cotton, and grains. In consequence, prosperous towns and agricultural communities grew up in various parts, notably the rich and populous Imperial Valley. In many points this California desert resembles Arabia or Egypt. Here, as in those ancient countries, the date palm, long-fiber cotton, and alfalfa flourish. The desert is traversed from end to end by the Southern Pacific railway, and by the Los Angeles-Yuma and other highways. See *Mojave Desert, Palm Canyon, Salton Sea.*

Colorado Springs. A city of central Colorado, situated near the eastern base of Pikes Peak at an elevation of 6000 feet above the sea. The city is a noted health and pleasure resort and has a beautiful system of parks, covering some 3000 acres. Among places of historic and scenic interest in the vicinity are Pikes Peak, Ute Pass highway, the Garden of the Gods, Cave of the Winds, Manitou Springs, Phantom Cliff Canyon, and Will Rogers shrine, halfway up Cheyenne Mountain. The city is the seat of Colorado College, the Colorado Springs Art Center, and the United States Air Force Academy. Population, 1970, 135,060.

Columbia. A city of Missouri, located about 125 miles northwest of St. Louis. Columbia is primarily an educational center, the seat of the University of Missouri and Stephens College for women. The city is in an agricultural area and has light manufacturing. Columbia was incorporated in 1826. Population, 1970, 58,804.

Columbia. The capital of South Carolina, situated near the center of the state on the high eastern bank of the Congaree River. The State capitol, built of granite at a cost of $6 million, is modeled after the national Capitol. Radiating from the capitol are four wide, well-shaded avenues. The most important industry is the manufacture of cotton. Electricity is provided by large hydroelectric developments in the vicinity, including the huge Saluda Dam. The city is the seat of the University of South Carolina and five colleges. The site of Columbia was settled about 1700; it was chosen for the capital, and the town was laid out in 1786. The legislature first met there in 1790. Population, 1970, 113,542.

Columbia River Highway. An important scenic highway constructed along the south side of the Columbia River in Oregon. It extends west from Portland through Astoria to Seaside on the Pacific Ocean, and east from Portland to Hood River, northeast of Mount Hood, a total distance of about 150 miles. This skirts the Columbia River by running around mountains, over hills, through tunnels, across viaducts, and along embankments.

At some points the highway reaches a height of 700 feet above the river, affording magnificent views. The highway passes near many beautiful cataracts, running immediately beside the celebrated Multnomah Falls, 607 feet high, and so close to Horse Tail Falls that the spray keeps the roadway moist.

Columbus. A city of southern Georgia, about 95 miles southwest of Atlanta, situated at the head of navigation of the Chattahoochee. The falls of this river provide power for the city's industries, and a channel connects the river with the Gulf of Mexico. Columbus played an important role in manufacturing army supplies for the Confederate Army during the Civil War, and is still an important industrial city, producing chiefly cotton textiles among its many manufactures. Fort Benning, the largest infantry post in the United States is located nearby. Population, 1970, 154,168.

Columbus. The capital of Ohio, located in the central part of the state, about 135 miles southwest of Cleveland and 120 miles northeast of Cincinnati. Surrounded by a productive agricultural region and by rich coal, iron, and natural gas fields, the city has developed into an important industrial and commercial center. The leading manufactures include agricultural, electrical, mill, and mining machinery, steel and steel products, boots and shoes, drugs, caskets, meat and other food products.

Columbus is laid out in a form somewhat resembling a Maltese cross. Parks and public grounds cover more than 9300 acres. Columbus is the seat of Ohio State University, which has a stadium capable of seating nearly 100,000 persons. Other educational institutions are the Capital University, Ohio Dominican College, the Josephinum College, and the Columbus College of Art and Design. On spacious grounds in the center of the city is the massive Doric capitol. Bordering the beautiful civic center is the Le Veque Lincoln Tower. Civic center buildings also include the City Hall and state and federal government buildings. An important junction point of the nation's airways, Columbus is the site of Port Columbus and the Rickenbacker Base Hospital for the U.S. Air Force.

Comparable to the growth of its educational institutions is the development of related activities which have made Columbus a center of scientific research. The internationally known journal *Chemical Abstracts* is published at the Ohio State University. The Battelle Memorial Institute, a foundation with affiliated laboratories in Frankfurt and Geneva, conducts basic research in chemistry, metallurgy, physics, fuels and combustion, and ceramic technology.

The first permanent settlement on the present site of the city was made in 1797. Columbus was laid out and was made the capital of the state in 1812. In 1816, the legislature first met in Columbus. Population, 1970, 539,677.

Concord. A town of Massachusetts, rich in historical and literary interest, situated some 20 miles northwest of Boston. Concord was founded in 1635. It was the British objective in the fighting at Lexington and Concord, which was the first armed conflict of the Revolution. The battle of Concord began at the Old North bridge. Here, April 19, 1775, the "embattled farmers fired the shot heard round the world." The town contains various memorials of the struggle, the most notable of which is the statue of "The Minute Man." Concord is celebrated also as the home of a number of distinguished figures in American literature, including Emerson, Hawthorne, Thoreau, and Louisa M. Alcott. Antiquarian House contains many mementos of the city's rich history. Population, 1970, 16,148.

Concord. The capital of New Hampshire, located in the Merrimack River Valley on a rolling and varied terrain. Industries include printing, electronics, research and development, and the manufacture of paper carton machinery. The famous Concord stagecoaches were made here during the days of Westward expansion in the United States. The impressive State Capitol is built of fine white native granite. Settled in 1725, the village, first called Pennacook and then Rumford, later changed its name to Concord. It became a city in 1853. It was the home of Mary Baker Eddy, founder of Christian Science. Population, 1970, 30,022.

Coney Island. A narrow island five miles in length, situated at the southwestern point of Long Island, near the entrance to New York harbor. The island is the most popular seashore resort in the United States. Coney Island is divided into four well-defined districts: West Brighton, which is provided with numerous popular means of amusement; Brighton Beach, containing a race track; Manhattan Beach, which is partly residential; and Sea Gate, the home station of the Atlantic Yacht Club.

Continental Divide. The crest or height of land in the United States which separates the waters draining into the Atlantic Ocean from those draining into the Pacific. This extends from the Mexican boundary northward across western New Mexico and then somewhat eastward to Rocky Mountain National Park in north central Colorado, its easternmost point. Thence the "great divide" trends northwest through northern Colorado and western Wyoming to Yellowstone National Park. Continuing westward and northward across Montana, it passes through Glacier National Park to the Canadian boundary. In some parts of its course, the Continental Divide is at the crest of the loftiest ranges; in others, it is on gently rolling uplands at the summit of high plateaus, usually 7000 feet or more above sea level.

Corn Belt. The fertile region in the east central United States which is largely devoted to the growing of corn. The most productive area embraces western Ohio, Indiana, Illinois, Iowa, Missouri, eastern Nebraska, eastern Kansas, and southeastern South Dakota. Adjoining parts of Kentucky, northern Oklahoma, and southern Minnesota, which produce large yields of corn, are usually considered as belonging to the Corn Belt. More than half of the corn crop of the United States is grown in this central zone.

Corpus Christi. A city and seaport of southern Texas, situated at the mouth of the Neuces River on Corpus Christi Bay. A deep-water channel to the Gulf of Mexico gives access for ocean ships to the city's well-equipped port facilities, opened in 1926. Corpus Christi Harbor Bridge spans the channel and is the highest bridge in Texas. Corpus Christi's industries and its exports, which include cotton, aluminum, petroleum, and seafoods, are based largely on the resources of the surrounding territory. Corpus Christi was chartered as a city in 1876. After the opening of the port, it grew rapidly, almost doubling its inhabitants in the decade of 1930–40. The University of Corpus Christi is located here. Population, 1970, 204,525.

Cotton Belt. The extensive region in the southern United States in which the immense cotton crop is produced. The zone of greatest productivity embraces eastern North Carolina, most of South Carolina, Georgia, Alabama, and Mississippi, parts of Arkansas, western Tennessee, northern Louisiana, and southern Oklahoma, and much of the northeastern half of Texas. Texas, Mississippi, and Arkansas are the leading states. The Cotton Belt produces about three-fifths of the world's supply of cotton.

Council Bluffs. A railroad, manufacturing, and commercial city of southwestern Iowa, located on the Missouri River opposite Omaha, Nebraska. For the most part, the city, which is well laid out, lies upon a plain largely surrounded by lofty bluffs. There are several parks, of which the chief one is Fairmount. Railroads, and vehicle bridges over the Missouri River, and also electric lines, connect the city with Omaha. Served by 8 major railroads, the city is a leading grain marketing center and has varied industrial interests, including the manufacture of truck bodies, farm implements, freight car wheels, bee supplies and cereals. The name Council Bluffs is said to have been given because of the council held at this point in 1804 between the Indians and the explorers Lewis and Clark. Population, 1970, 60,348.

Covington. A city of Kentucky, situated on the Ohio River, opposite Cincinnati. Covington occupies a beautiful site, partly surrounded by lofty hills, and contains many fine streets and homes. It has excellent transportation facilities by rail and by river, and is connected with Cincinnati by three bridges. While largely residential, Covington has substantial industries, including meat packing and the manufacture of machine tools, canvas goods, hardware, and structural iron. Devon Park, 550 acres, on the outskirts, has a large natural amphitheater. St. Mary's Cathedral, patterned after Notre Dame in Paris, has one of the largest stained-glass windows in the world. Covington, the seat of Thomas More College, was settled in 1812, and became a city in 1834. Population, 1970, 52,535.

Crater Mound (now **Meteor Crater**). A remarkable geological formation in central Arizona, about 40 miles southeast of Flagstaff. First known as Coon Butte and later as Meteorite Mountain, Crater Mound ranks as one of the most remarkable geological features of the West.

Viewed from the Santa Fe railway, which passes some miles to the north, it appears as a low ridge. Upon close approach, this ridge is found to be circular in form and to enclose an immense crater-like hole or depression 4000 feet in diameter and 600 feet deep. The encircling ridge, 100 to 150 feet in height, is composed of fragments of rock and sand blown up from the hole. The beds of rocks in the walls of the hole are limestone above and sandstone below, both more or less upturned near the hole and in part considerably shattered.

The cause of this great hole was long a mystery. The occurrence of many small masses of meteoric iron in the vicinity suggested that it was made by the impact of a meteorite. All efforts to locate the main body of such a meteorite failed until 1932, when with the aid of electrical instruments, geophysicists located the metallic mass at a depth of 680 feet.

Crawford Notch. A picturesque gorge between Mount Webster and Mount Willey, in the White Mountains of New Hampshire. In a narrow passage, at an elevation of about 1900 feet, the Saco River traverses the Notch, which is notable for its fine rock scenery.

Cumberland. A city of western Maryland, situated on the Potomac River, about 155 miles northwest of Baltimore. Cumberland is located in a mountainous region near important coal fields. It ships immense quantities of semibituminous coal, highly valued for steaming purposes, and has other extensive industries. The principal manufacturing establishments are railway repair shops, rubber tire, cellulose and glass factories, and silk, flour, and lumber mills. Population, 1970, 29,724.

Cumberland Road, or the National Road or Great National Pike. Originally envisioned by George Washington, the project to connect the East and the central West was initiated by Thomas Jefferson in 1806. Beginning as a federal government project, it was completed as such only from Cumberland, Md., to Wheeling, W. Va. It was then connected with older pikes in the East and with newer ones in the West, with individual states assuming responsibility for maintenance of the road. The Cumberland Road is still a means of travel from Chesapeake Bay, its easternmost point, to St. Louis, Mo., its western limit.

Currecanti Needle. One of the striking scenic features of the Black Canyon of the Gunnison River, in southwestern Colorado. It is a massive pinnacle of highly colored rock, hundreds of feet in height, and tapering at the top to a somewhat pointed spire, whence the name "needle."

Dallas. The second largest city of Texas, located on Trinity River, in the northeastern part of the state, about 185 miles northeast of Austin. Dallas is located in an exceedingly fertile agricultural region, the chief cotton growing district of the state. The city is in the center of the world's largest oil field. It is the largest inland cotton

market in the United States, and the leading wholesale and jobbing center southwest of Saint Louis. Dallas is the chief distributing point in the Southwest for farm implements and automobiles. In manufactures, Dallas ranks first among the cities of the state. The principal industries include oil refining, meat packing, printing and publishing, the manufacture of oil well and cotton ginning machinery, airplanes, automobiles, cottonseed oil, saddlery, harnesses, and cotton goods. Its fine commercial structures include the 42-story Southland Tower and the 36-story Republic National Bank Building.

The city's parks embrace an area of more than 15,500 acres, and there are extensive boulevards and drives. The state fair, held annually in the city, attracts more than three million visitors. The city is the seat of the Southern Methodist University, University of Dallas, Baylor Dental School, Dallas Art Institute, and museums of fine arts and natural history. Dallas was settled in 1841 and chartered as a city in 1856. Population, 1970, 844,401.

Danbury. A city of Connecticut, about 13 miles northwest of Bridgeport. Danbury is noted for manufacturing hats, especially felt ones. It was the site of several significant incidents during the Revolutionary War. Danbury was chartered as a city in 1889. Population, 1970, 50,781.

Davenport. A commercial and manufacturing city of eastern Iowa, situated on the slope of a steep bluff of the Mississippi River, opposite Rock Island, Illinois. The chief manufactures include aluminum products, meat products, and farm implements. An extensive business is carried on in flour and grain by river as well as by rail transportation. The city has a municipal art gallery, a public museum, and an excellent park system. Educational institutions include St. Ambrose College, Marycrest College, and Palmer College of Chiropractic. Founded in 1835, Davenport was incorporated as a town in 1838 and received its charter as a city in 1851. Population, 1970, 98,469.

Dayton. A manufacturing city of southwestern Ohio, situated on both banks of the Miami River, about 50 miles northeast of Cincinnati. Among the leading manufactured products are cash registers, envelopes, electric motors, electrical refrigeration machinery, and automobile accessories. A great contribution to the city's prestige has been made by the airplane industry, founded by the Wright brothers, to whose memory a beautiful monument has been erected in the city. Other structures of note include the Art Institute and Museum and the Deeds' Carillon Tower with 32 bells. Wright field accommodates the experimental laboratories of the U. S. Air Corps. Patterson Field and the Fairfield Air Depot are also located here.

First settled in 1796, Dayton became a city in 1841. In 1913 a disastrous flood caused great destruction of property and loss of life. The devasted sections were rebuilt, and a system of five reservoirs, costing $32,000,000, was constructed to prevent a repetition of the disaster. Population, 1970, 243,601.

Daytona Beach. A year-round resort city of Florida, situated on the Halifax River, 53 miles south of St. Augustine. Well-known automobile speed trials are held on the city's 23-mile, hard-packed, white sand beach. Tourism is the chief industry. Population, 1970, 45,327.

Dearborn. A city of southeastern Michigan, ten miles west of Detroit, of which it is a residential suburb. Henry Ford had his home there, his birthplace being on a farm in the vicinity. This farm he restored to its early appearance and he built there a village museum, "Greenfield village," consisting of old buildings collected from all parts of the United States and from England. An outstanding example of modern architecture is the Ford Rotunda exhibit hall. Population, 1970, 104,199.

Death Valley. An extremely arid desert in eastern California, near the Nevada boundary, containing the lowest point of dry land in the Western Hemisphere. The name was given by a survivor of a party of 30 "forty-niners," most of whom perished of thirst in its sands. It lies in a north-and-south direction, is about 150 miles long, and varies in width from 4 miles to 16 miles. On the west it is bordered by the high Panamint Range; on the east it is flanked by the Funeral, the Black, and the Grapevine mountains. The lowest point in Death Valley is 282 feet below sea level. In a direct line, this lowest point is about 86 miles east of Mt. Whitney, 14,496 feet high, the loftiest peak in the United States outside Alaska.

The valley is in the sink of the Amargosa River, a stream that is dry for the greater part of the year throughout much of its course. The eastern side of the valley was formerly the bed of a salt lake. In the entire area, drinkable water can be obtained in only a few places. The salty bottom of the valley is destitute of vegetation, but the bordering slopes have a sparse growth of desert shrubs. The annual rainfall averages 1.66 inches; the average humidity is very low—no dew ever forming, and the summer temperatures, reaching 134°, being the hottest authentically recorded in America. See *Colorado Desert, Mojave Desert.*

Decatur (*dē-kā'tŭr*). Located on the Sangamon River, almost in the center of Illinois, Decatur lies in the corn and soy bean belt. The city's chief industrial establishments include railway shops, metal and wood-working plants, soy bean processing plants, and factories for the making of tractors, graders, air conditioners, window glass, and gas and water systems. Decatur is the seat of Millikin University. Recreation is afforded by a 160-acre park system and by a lake 12 miles long formed by a dam across the Sangamon River. The city was named for Stephen Decatur, naval hero. Population, 1970, 90,397.

Delaware Water Gap. A picturesque gap and narrow gorge in the Kittatinny Range, near Stroudsburg, Pa., on the borders of Pennsylvania and New Jersey. The steep sides of the mountain here rise to an elevation of 1400 feet above the Delaware River, which flows through the gap.

Denver. The capital of Colorado. It is situated at the junction of Cherry Creek and South Platte River. The site, which has an altitude of one mile above the level of the sea, slopes back from both banks of the river and commands a magnificent view of the Rocky Mountains. Denver is the largest city between the Missouri River and the Pacific coast. It is also one of the most important railway centers of the West, to which fact, in great measure, it owes its growth and prosperity.

The city is handsomely planned and contains many fine public buildings and substantial private residences. Among the former may be noted the State Capitol, the Auditorium, the United States Mint, and the Civic Center, whose 5 million-dollar City and County building is said to have the largest bronze doors in the world. The Fitzsimons General Hospital for army tubercular patients is one of the largest buildings in Colorado. Some of the principal educational institutions are the University of Denver, Regis College, Westminister College, and Colorado Woman's College. The City Park, which covers 408 acres, has a zoological garden, a lake, a museum, aviary, and speedway. The park system, including about 40 parks in all, is one of the finest in the United States and is supplemented by a system of 38 municipal mountain parks in the vicinity.

Denver is the principal center of mercantile supply for the agricultural, stock raising, and mining districts of Colorado and New Mexico. The chief industries include meat packing, flour milling, railway car construction, printing and publishing, and the manufacture of iron and steel products, structural iron, clothing, paints, automobile accessories, and chemicals. Population, 1970, 514,678.

Des Moines (*dē moin'*). The capital of Iowa, built on both banks of the Des Moines River, in the central part of the state. Des Moines is the commercial center of an exceedingly fertile farming region, with which it carries on an extensive marketing and wholesale trade. Surrounded by rich farm lands, the city has developed numerous and varied industries, prominent among which is the production of machinery, food products, and clothing. Many important farm journals and other publications are printed in Des Moines, which is also the center of large insurance interests.

Chief among many imposing public buildings is the Capitol, built on a slight eminence, and approached by Capitol Extension park. Adjoining this park is the fine State Historical Building. The city's park system includes 58 parks and covers 1500 acres. To this total may be added the 600 acres comprising the State fairgrounds. Des Moines is the seat of Drake University and of the Des Moines College of Osteopathy and Surgery.

By reason of its central location, together with ample hotel and auditorium facilities, Des Moines is a favorite meeting place for conventions. The city's unique civic center consists of a landscaped area taking in the opposite banks of the river. In the group of buildings are the Post Office and Library, the City Hall, the Federal Court Building, the Y.M.C.A., and the municipal armory.

Around Fort Des Moines, which was established in 1843, settlers, in 1846, built a village. This village was incorporated in 1851 as the town of Fort Des Moines. In 1856, the town was made the capital of the state. In the following year, it was chartered as the city of Des Moines. Population, 1970, 200,587.

DETROIT. The chief city of Michigan and the fifth most populous in the United States, situated on the Detroit River, 18 miles from Lake Erie. It lies some 90 miles southeast of Lansing, the capital of the state, and is about 250 miles west of Buffalo and 285 miles east of Chicago. The city occupies a nearly level but gently rising site, extending some 12 miles along the river front, and containing an area of about 138 square miles.

Streets and Buildings. The city is regularly laid out, with wide streets, most of which cross at right angles on the checkerboard plan. There are, however, several broad avenues, 100 to 200 feet wide, which radiate from the Campus Martius and the Grand Circus in the heart of the city.

The commercial district is located mainly around and near the Grand Circus and the Campus Martius. The former is a small, semicircular park, and the latter is a large plaza. These are situated near each other and give an air of openness and spaciousness to the business center of the city. Griswold Street, lined with great office buildings and banking houses is the "Wall Street" of Detroit.

The chief public buildings are located on or near the Campus Martius. Within it is the Michigan Soldiers' and Sailors' monument, facing the City Hall. Nearby is the skyscraper City-County Building. Numerous great office buildings, of the finest modern type, are built around portions of the Grand Circus. Among many notable buildings may be mentioned the General Motors Building, the Veterans Memorial Building, the Ford Auditorium, the Fisher Building, the Federal Building, the Board of Commerce, the Michigan Central Station, the Masonic Temple, the Ford, Penobscot, Stroh, First National Bank, and Majestic buildings, the Public Library, Bank of the Commonwealth, and the Detroit Institute of Art.

Parks and Boulevards. The municipal system contains upwards of 242 parks, embracing an area of about 3600 acres. The most notable of these is the island park, Belle Isle, with an area of 1000 acres, where is situated one of the country's best zoological gardens. This lies opposite the eastern part of the city, with which it is connected by a bridge. River Rouge Park is the largest, 1204 acres in area. In addition to the numerous small parks, many triangles at diagonal street intersections have been improved and ornamented, and there are numerous boulevards.

Educational Institutions. Detroit is the seat of Detroit University, Wayne State University, the Detroit College of Law, the Michigan College of Medicine, the Michigan State Auto School, and various other educational institutions.

Transportation. The city owes its greatness, in a large part, to unique advantages in transportation both by lake and by rail. It is situated midway on the inland waterway system of the Great Lakes. The deep Detroit River, sometimes called the "Dardanelles of America," affords a spacious harbor, accommodating the largest lake vessels. There is a numerous passenger fleet, and the city is a port of call for all steamers from Buffalo to the upper lakes. The tonnage passing through the Detroit River is more than double that passing through the Suez Canal, and is immensely greater than the tonnage arriving at and leaving any other inland seaport in the world.

Local transportation is effected by a comprehensive system of municipally owned street railways and bus lines. The city is connected with Windsor, Canada, by a tunnel and the great Ambassador suspension bridge.

Commerce. Enormous quantities of iron ore, copper products, grain, and coal are handled by the lake traffic. There is a large export trade to Canada and Europe, chiefly foodstuffs, automobiles, and steel products. The city is the commercial center of a great interior district with which it carries on an immense distributing trade. In addition, it ships the products of its vast industries to all parts of the country.

Manufactures. Detroit is the greatest automobile manufacturing center in the world. Its phenomenal growth in the early 20th century corresponded with the vast development of the automobile industry. In value of manufactures, Detroit stands fourth among the cities of the United States. The greater part of this production is automobiles and automobile accessories and parts. There are numerous other substantial industries. Detroit is a leading center for the manufacture of aircraft, brass and bronze products, adding machines, stoves and furnaces, malleable iron, and aluminum castings. Other important manufactures include railway cars, machine tools, electrical apparatus, drugs, chemicals, engines, paint, tobacco, and rubber goods.

History. The first settlement at Detroit was made in 1701 by Cadillac, the French governor of Michillimackinac, who built Fort Pontchartrain. During the French and Indian War, this was captured, 1760, by the British. The first act of Pontiac's conspiracy, 1763, was an unsuccessful attempt to seize this important fort. Detroit was incorporated in 1802 and became the capital of Michigan territory in 1805. In 1812, William Hull surrendered the town to the British, who evacuated it the following year.

Detroit was chartered as a city in 1824, continued as the capital of the territory until 1835, and was the capital of the state, 1835–47. Its growth until 1910 was continuous and substantial. In the decade 1910-20, the city more than doubled in population and more than quadrupled in value of manufactures. Population, 1970, 1,511,482.

Diablo (*dē-ä'blō*; *dī-ăb'lō*), **Mount.** A mountain of west central California, situated on the edge of the great interior valley, about 30 miles air-line distance nearly due east of San Francisco. Its general domelike outline and isolated position have given the erroneous impression that Mount Diablo is an old volcano. It is, in fact, the higher portion of a great overturned arch of sedimentary rocks.

Because of its visibility for long distances in many directions, Mount Diablo has been a noted landmark since the days of the "forty-niners." Through it run the meridian and the base line from which the land surveys of a large part of California are reckoned. While of moderate height, the elevation being 3849 feet, its unique situation makes it one of the finest scenic viewpoints in the state.

Dismal Swamp, Great. A tract of marshy land in southeastern Virginia and northeastern North Carolina. It begins a short distance south of Norfolk, Virginia, extends southward for about 30 miles, and embraces a total area of some 750 square miles. Near its center is Lake Drummond, about 2 miles in diameter and very shallow. The remainder of the swamp is covered, for the most part, with heavy timber and a thick tangled undergrowth. The swamp originally contained an area of about 2200 square miles, but much of it has been reclaimed and placed under cultivation.

Dobbs Ferry. A village of New York State, on the Hudson River 20 miles north of New York City. Here are located two schools for girls—the Masters School and the Sacred Heart Academy. In the Livingston Manor here Washington and Rochambeau planned the Yorktown campaign. Opposite this village the American flag was saluted for the first time by a British sloop of war. Population, 1970, 10,353.

Dover. The capital of Delaware, located slightly north of the center of the state. Dover is surrounded by a rich fruit growing country, the chief crops being apples, grapes, melons, and peaches. The principal industry is the canning of plum pudding, poultry, and other foods. There is an impressive State Capitol and a handsome monument erected to the memory of Cæsar Rodney, one of the signers of the Declaration of Independence. The Archives Building houses Delaware's earliest records. Silver Lake Park and Dover Green are other features of interest. Dover was laid out in 1717 and became the capital of Delaware in 1777. It became a town in 1829; a city in 1925. It is the seat of Delaware State College. Population, 1970, 17,488.

Dubuque (*dŏŏ-bŭk'*). A city of northeastern Iowa, built on the west bank of the Mississippi River, about 200 miles northeast of Des Moines. Dubuque lies in a fertile farming district and the surrounding region is rich in lead and zinc deposits. Dubuque has substantial manufacturing industries, and is the center of a large marketing and distributing trade by river and by rail. The city is situated partly on a terrace 20 feet above the river and partly on a hill, which rises to a height of 200 feet.

Among the notable features are Eagle Point park which has a very large ledge garden. There is also a monument to Julien Dubuque, who settled on the site of the city in 1788. The first permanent settlement dates from 1833. The village was incorporated as a town in 1837, and, in 1840, was chartered as a city. The educational institutions include Loras and Clarke colleges and the University of Dubuque. Population, 1970, 62,309.

Duluth. An important lake port and the third largest city of Minnesota. It is built on steep and picturesque slopes overlooking a fine natural harbor at the western end of Lake Superior. Enjoying the advantages of exceptional railroad and port facilities, Duluth handles an annual tonnage of grain and iron ore of stupendous proportions. Impetus to its further expansion has come from the newly-developed Taconite industry and the completion of the St. Lawrence Seaway. Hydroelectric power, available in abundance, contributes to a large industrial activity, which includes the manufacture of steel, wood products, clothing, cement, and food products.

The city's natural beauty is enhanced by 106 miles of scenic drives, by 3216 acres of parks, 74 in all, including Minnesota Point, which extends 7 miles into the lake, and by facilities for summer and winter sports. The chief public buildings cluster about the attractively designed civic center. Population, 1970, 100,578.

Durham. A city of central North Carolina, 25 miles northwest of Raleigh. It is one of the leading tobacco centers of the country, both for marketing and manufacturing. Cotton and hosiery mills constitute a second industry of large proportions. Durham is the seat of Duke University, developed from Trinity College and richly endowed by James B. Duke, a large tobacco manufacturer and developer of hydroelectric power. The city contains also North Carolina College at Durham and is the headquarters of the country's leading life insurance company for Negroes. General Johnston surrendered to Sherman at Durham in 1865. Population, 1970, 95,438.

East Chicago. A city of northwestern Indiana on Lake Michigan. It adjoins Hammond, Gary, and Whiting and is 20 miles southeast of the center of Chicago, of which it is an industrial suburb. The part of the city along the lake is known as Indiana Harbor, and handles a large traffic of incoming coal, iron ore, and limestone with shipments of gasoline and steel products. The chief industries are steel manufacture and oil refining. Population, 1970, 46,982.

East Orange. A city of northeastern New Jersey, adjoining Newark, and about 11 miles west of New York City. East Orange is mainly residential, being populated largely by persons doing business in New York and Newark. The city has wide, well shaded streets, and contains many attractive homes and public buildings. There are substantial industries and the chief manufactures include electrical machinery, valves, tools, sewer pipe, and knit goods. East Orange was separated from Orange in 1863 and became a city in 1899. It is the seat of Upsala College. Population, 1970, 75,471.

East St. Louis (*lōō'ĭs*; *lōō'ĭ*). A city of southwestern Illinois, built on the east bank of the Mississippi River, opposite Saint Louis. The city is an important railway and manufacturing center. It is also a leading market and distributing point for live stock, especially horses, mules, and hogs. The leading industries include meat packing, flour milling, and the manufacture of iron and steel products, aluminum, baking powder, glass, paints, chemicals, and refined petroleum. Population, 1970, 69,996.

Edison. A rapidly growing residential and industrial suburb in Middlesex County, New Jersey, 27 miles southwest of New York City. Here are located the Menlo Park Museum and the Edison Tower, erected on the site of Thomas A. Edison's laboratories, where the incandescent lamp, the phonograph, and other inventions were developed. Industries include an automobile assembly plant and factories for the fabrication of electronic equipment and plastic and ceramic products. Population, 68,000 (est.).

Elizabeth. A manufacturing and suburban residential city of New Jersey, lying 12 miles southwest of New York City. It is connected with Staten Island by Goethals Bridge, opened in 1928. Among important industries are oil refining and the manufacture of sewing machines, chemicals, and electrical machinery. Elizabeth was settled in 1664 and still preserves many examples of colonial architecture. From 1755 to 1757 the city was the capital of New Jersey. Population, 1970, 112,654.

Elmira (N.Y.). From the village originally called Newtown, which was established in 1790, Elmira grew into a flourishing center of commerce, with water shipping connections by way of the Chemung and Susquehanna rivers and the Chemung Canal. The Erie Railroad was built here in 1849. Elmira's most famous citizen, by marriage and adoption, was Mark Twain, whose wife, Olivia Langdon, lived here. During many summers which they spent at Quarry Farm, the home of Mrs. Theodore Crane, Olivia's sister, Mark used a study that was built for him in the shape of a pilot house on a Mississippi River steamboat. The study is now on the campus of Elmira College. In Woodlawn Cemetery is a monument to Mark Twain, erected at his burial site.

Elmira has extensive manufacturing industries. The more important products include steel bridges, prefabricated houses, television tubes, milk containers, coaster brakes, and aviation equipment. A glider contest is held annually on Harris Hill nearby. Population, 1970, 39,945.

El Monte. A city in California, located 13 miles east of Los Angeles Civic Center, settled by pioneers who found water here at the end of the Sante Fé Trail. There are many hop fields and walnut groves in the area. Although El Monte is primarily residential, nearby South El Monte is heavily industrialized. Population, 1970, 69,837.

El Paso (*ĕl păs'ō*). An important railway center and manufacturing and commercial city of western Texas, about 1200 miles by rail from New Orleans and 800 miles from Los Angeles. El Paso is situated on the Rio Grande River opposite Ciudad Juarez, and is the largest city on the Mexican border.

The chief industries include smelting, flour milling, railway car repairing, box making, meat packing, cotton milling, and the manufacture of cement and garments. The city has extensive wholesale and jobbing establishments, and carries on a substantial trade in copper, silver, lead, wool, hides, and live stock. Trade with Mexico amounts to many millions of dollars annually.

Located at an elevation of about 3800 feet in a region of almost perennial sunshine, El Paso has become a noted health resort. Buildings show a pronounced Mexican influence. Much of the surrounding district is irrigated by the great Elephant Butte Dam, and produces large crops of grains, fruits, vegetables, and cotton, which are marketed chiefly through El Paso. El Paso is the seat of The University of Texas at El Paso.

The first settlement was made in 1829, the town was incorporated in 1869. Population, 1970, 322,261.

Enchanted Mesa (*mā'sə*). A remarkable castle-like rock or, more accurately speaking, a butte, situated near the Indian pueblo of Acoma in west central New Mexico. It is an immense mass of buff sandstone, with perpendicular sides, rising boldly from an arid plain. In shape it is elongated, the length measuring about 2000 feet and the width from 100 to 350 feet. At the base there is a sloping heap of rock debris, 100 to 200 feet high, above which towers the vertical wall to an elevation of 430 feet above the plain.

Evidence of former human occupation is slight, but Acoma Indians believe that their remote ancestors inhabited a pueblo built on the flat-topped summit.

Endless Caverns. A large cave two miles south of New Market, Virginia. Its name indicates that its farthest reaches are unknown.

The cave was discovered by two boys on October 1, 1879. Among the marvelous formations within the cave are "Skyland," recalling by its coloring the play of sun and cloud in the sky, "Alpine Pass," the "Arctic Circle," "Diamond Lake," and "Oriental Palace."

Erie. A manufacturing city of northwestern Pennsylvania, situated on a large natural harbor on Lake Erie. The harbor is protected by Presque Isle, a peninsula about 11 miles long and a mile wide, on which there is a 3100-acre forested state park. There is considerable lake commerce; the leading articles of shipment include pulpwood, sand and gravel, petroleum, and manufactured goods. Among the city's varied manufactures are foundry and machine shop products, engines, excavating machinery, and paper. Erie has 19 parks, one of which, Presque Isle State Park, near the harbor entrance, is the site of an old French fort, erected in 1753. The original site is now occupied by a blockhouse, built by the state in order to commemorate Anthony Wayne, who died at the old fort in 1796. In the War of 1812, Erie was Commodore Perry's headquarters. Population, 1970, 129,231.

Eugene (*ū-jēn'*). A city of western Oregon, located at the head of navigation on the Willamette River, 110 miles south of Portland. It is the commercial center of an extensive farming and stock raising region, and its industrial products include lumber products and canned fruit and vegetables. Eugene was first settled in 1864 and is the seat of the University of Oregon. It is at the head of the Willamette flood control basin. Population, 1970, 76,346.

Evanston. A city of northeastern Illinois, situated on Lake Michigan at the northern boundary of Chicago, of which it is a residential suburb. Evanston is the seat of Northwestern University, including a large technological institute. It is also the national headquarters of the Women's Christian Temperance Union. Manufactures include steel tubing, toys, chemicals, and paper. Population, 1970, 79,808.

Evansville. A manufacturing and commercial city of southwestern Indiana on the Ohio River, about 180 miles southwest of Indianapolis. The city is situated on a high bank of the river and has many fine parks, streets, and drives. It is surrounded by a rich agricultural district, and within the vicinity of the city are numerous coal mines. The chief industries include the manufacture of agricultural equipment, refrigerators, steam shovels, and grain products. Founded in 1816, Evansville became a city in 1847. Population, 1970, 138,746.

Everett. A city of eastern Massachusetts, located on the Mystic River, about 3 miles north of Boston. While mainly a residential suburb, containing many fine streets and homes, Everett is also the seat of important industries. Among these are the manufacture of coke and petroleum products. Everett was settled in 1643, but until 1873 was known as South Malden. In 1892, it was chartered as a city. Population, 1970, 42,485.

Everett. A city of northwestern Washington, with a good harbor on Puget Sound, about 28 miles north of Seattle. The surrounding region is heavily timbered, and there are extensive agricultural, mining, sporting and fishing interests. With these, the various enterprises of the city are chiefly connected. Among leading industrial products are the manufacture of lumber, pulpwood, paper, aircraft, stoves, and machinery. Population, 1970, 53,622.

Everglades. An immense marshy tract in southern Florida, covering an area about 140 miles by 50 miles. Drainage canals have been cut through various parts of the swamp, and some of the higher portions have been rendered suitable for agriculture. It is estimated that some 5000 square miles may eventually be reclaimed. Over 2000 square miles of it was made a national park in 1947.

Fairbanks. A city of Alaska lying in the Tanana River valley, on the banks of the Chena River. It is the terminus of the government railway from the coast, has a large airport, and was once the center of an extensive gold-mining district. It is also the seat of the University of Alaska. Population, 1970, 14,771.

Fall River. A manufacturing city and seaport of southeastern Massachusetts. It is built on the shore of Mount Hope Bay, at the mouth of Taunton River, about 50 miles south of Boston. Fall River is a leading center for dyeing and finishing textiles and for the manufacture of garments, curtains, lighting fixtures, and latex and aluminum products. The city is well laid out and substantially built. Many of the buildings are constructed of fine granite quarried in the vicinity. There are several parks with beautiful drives. The population in 1970 was 96,898.

Fargo. A city of North Dakota, situated on the Red River, somewhat south of the center of the state near the Minnesota boundary. Fargo is the commercial center of a large wheat growing and mixed farming region, and is a leading distributing point for farm implements. Industries include meat packing and manufacture of steel products. It is the seat of North Dakota State University and other educational institutions. There are a number of fine parks totaling 480 acres in area and several beautiful drives. Population, 1970, 53,365.

Finger Lakes. The name given to a group of beautiful lakes in west central New York. These lakes, which are long, narrow, and somewhat finger-like in shape, were formed by the blocking up of deep river valleys with glacial materials. They lie somewhat parallel to each other, extend in a general north and south direction, and give a distinctive character to a fine scenic region.

The largest are lakes Seneca and Cayuga, each of which is about 40 miles long and from 2 to 3 miles wide. Others of the group are lakes Canandaigua, Owasco, Skaneateles, and Otisco. Oneida lake, northeast of Syracuse, and Lake George, in eastern New York, are of similar formation.

Fitchburg. A manufacturing city of northeastern Massachusetts, built on a branch of the Nashua River, about 48 miles northwest of Boston. Fitchburg is attractively located and has many fine homes, public buildings, and parks. The city's extensive manufactures include cotton and woolen goods, turbines, plastics, furniture, paper, saws, bicycles, hardware, and shoes. The city is the seat of Fitchburg State College. Fitchburg was settled in 1719, was incorporated in 1764, and became a city in 1872. Population, 1970, 43,343.

Flagstaff. A city of north central Arizona, located at an altitude of 6907 feet, near the southern base of the San Francisco Mountains. It is the commercial center of a lumbering, mining, and stock-raising district, has large lumber mills, and carries on a trade in Indian curios and blankets. Lowell Observatory is situated on a high mesa near the city.

By reason of its fine climate and varied scenic attractions, Flagstaff is also a tourist resort. Ten miles north are the San Francisco Peaks, of which Humphrey's Peak is the highest, 12,670 feet. The mountains are remnants of an extinct volcano. The region contains ancient lavas and is interspersed with numerous cinder cones. One of the most conspicuous is Sunset Crater, a large cone tipped with bright red cinders, giving it the appearance of being illumined by the setting sun.

About 8 miles east of Flagstaff are the remarkable sink holes in the Kaibab limestone, known as the "Bottomless Pits." In the near vicinity also is the Walnut Canyon national monument containing prehistoric cliff dwellings. Population, 1970, 26,117.

Flint. A manufacturing city of southeastern Michigan, situated on the river of the same name, about 70 miles northwest of Detroit. Flint is, after Detroit, the world's largest center of automobile manufacture. Its industries center around various subsidiaries of the General Motors Corporation, including the Chevrolet, Buick, and Fisher Body divisions. The 42 public parks of the city have a total area of 1275 acres. Population, 1970, 193,317.

Fort Knox. A United States fort in eastern Kentucky directly south of Louisville and 600 miles west of New York City. It is noted as the repository of the greater part of the monetary gold stock of the United States, its location west of the Allegheny Mountains making it comparatively secure from a hypothetical invader from the East. The gold storage building is constructed with walls of solid granite two feet thick, behind which are fabricated coils of steel set in concrete. The building, having a floor area of 10,000 square feet, is two stories high, the second set back so as to leave a parapet at each corner of which machine guns are mounted. The gold vault is 90 feet long, 50 feet wide, and two stories high. All parts of the vault's exterior are visible to guards from all angles by means of mirrors. Microphones and automatic alarms communicate with the guard room, from which messages may be sent to a motorized unit of the army in the adjacent fort. The first shipment of gold was taken to Fort Knox in 1937. Population, 1970, 37,608.

Fort Lauderdale. A flourishing commercial, industrial, tourist, and residential center in the lower east coast area of the Florida peninsula. Its business district is between two and three miles of the Atlantic Ocean. The city's transportation needs are served by two railroads and by major bus and truck lines. Adjacent are the Ft. Lauderdale-Hollywood International Airport and the steamship terminal, Port of Everglades. Because of its favorable climate and excellent visitor accommodations and the transportation facilities, Ft. Lauderdale has become a favorite convention center. Population, 1970, 139,590.

Fort Wayne. A railroad center and manufacturing city of northeastern Indiana. It is built at the confluence of the St. Joseph and the St. Mary's rivers which here join to form the Maumee River. Car shops, car wheel works, foundries, hosiery mills, clothing, motor truck, copper and enamelled wire factories, electrical machinery works, and oil tank shops are among the chief industrial interests. Among the largest buildings is the office of the Lincoln National Life Insurance Company, occupying an entire block. The city encloses the site of a fort built in 1794 by Anthony Wayne, to whom a monument has been erected. Population, 1970, 177,671.

Fort Worth. An important commercial city and railway center of northeastern Texas, situated in the midst of a rich agricultural and oil producing territory. The city is one of the great cattle and grain markets of the United States and one of the world's greatest petroleum pipe-line centers. Seventeen railways enter the city. Industries include oil refining, meat packing and the manufacture of flour, textiles, cement, and cottonseed products.

Of unique distinction is the Casa Manana Theatre, a structure of geodesic design built of aluminum and supported by steel struts. Educational institutions include the Texas Christian University and the Texas Wesleyan College. The city has 101 parks, covering 10,116 acres. Population, 1970, 393,476.

Franconia Notch. A narrow picturesque passage in the Franconia range of the White Mountains in New Hampshire, through which the Pemigewasset River flows. Entering the notch from the east is a narrow passage excavated in the rock, called the "flume." Nearby is the "great stone face" celebrated by Hawthorne. The territory is embraced in a 6000-acre state park.

Frankfort. The capital of Kentucky, situated on the Kentucky River, in the rich "Blue-Grass" and limestone region, somewhat northwest of the center of the state. Its manufactures include lumber, shoes, brooms, twine, tobacco, and concrete pipe. Many thoroughbred trotting horses are raised in the vicinity. In a setting of rare beauty is the State Capitol, behind which is the large Capitol Annex Building.

Frankfort was founded in 1786, and, in 1792, when it had a population of less than 500, was made the capital of the state. The city contains the grave of Daniel Boone and is rich in historical associations. Population, 1970, 21,356.

Fresno (*frĕz'nō*). Commercial center of a noted fruit growing district, Fresno is located in the irrigated portion of the fertile San Joaquin Valley, about 200 miles southeast of San Francisco. In addition to peach growing, in which it excels, the country surrounding Fresno has a high yield of grapes and raisins. Other important crops are alfalfa, flax, cotton, sugar beets, grain, vegetables, and some tropical fruits.

The industrial and commercial activities of the city are centered chiefly upon handling and marketing the county's staple productions. Places of interest in the vicinity are King's River Canyon, Roeding Park, and Kearney Park, the last an irrigated experimental farm belonging to the University of California. Population, 1970, 165,972.

Gadsden. A city of northern Alabama, on the Coose River, 58 miles northeast of Birmingham, to which Gadsden is second in importance in Alabama in industry, manufacturing iron and steel products, rubber products, and many other items. The city has good transportation facilities and is in the midst of an agricultural and mining region. Population, 1970, 53,928.

Gainesville. A city of Florida, located about midway between the Atlantic Ocean and the Gulf of Mexico. It is noted for manufacture of tung oil, used in paints, and as a shipping center for many of the products (such as tobacco, citrus fruits, and pecans) grown in the area. Located in Gainesville are the Florida State Museum and the University of Florida. Population, 1970, 64,510.

Galveston. The world's largest cotton and sulphur port, situated in southeastern Texas. It is built on the east end of Galveston Island between Galveston Bay on the north and the Gulf of Mexico on the south.

The excellent natural harbor facilities have been further improved at vast expense, and the port has been fortified by modern coast defensive works. Manufactures include flour, ships, and steel wire. Since a disastrous flood, caused by a hurricane in 1900, the level of the city has been raised, a sea wall has been built along the shore facing the Gulf, and two 2-mile causeways have been constructed joining the city with the mainland. The Medical School of the University of Texas is situated in the city. In 1901, Galveston adopted the commission form of government, which has since been widely adopted by other American cities. Population, 1970, 61,809.

Garden of the Gods. A small region of about 500 acres, near Colorado Springs, Colorado, noted for its curiously shaped rock formations and for its magnificent views of Pikes Peak. By the action of wind and water, the red and the white sandstone strata have here been worn into many grotesque shapes. To these, various fanciful names have been given, such as "Cathedral Spires," "Balanced Rock," "Siamese Twins," and the "Seal and the Bear." The gateway to these interesting examples of erosion consists of two massive pinnacles of red rock, 300 feet high, which, at their bases, leave barely room for a vehicle to pass between them.

Gary. A steel manufacturing city of northwestern Indiana, at the southern end of Lake Michigan, about 30 miles southeast of Chicago. The city was founded in 1906 and is virtually the creation of the United States Steel Corporation. It contains immense steel works, tin and rail mills, and a cement plant, each of which is among the largest of its kind. The city is well planned with broad boulevards, giving an air of spaciousness. Its 18 parks cover 700 acres, Marquette Park being particularly attractive. A civic gateway, flanked by twin-designed Courthouse and City Hall, leads to the great steel mills over an area traversed by trunk-line railroads. Nearby is the Indiana Dunes State Park. The so-called Gary plan of elementary education originated in the public schools of the city. Population, 1970, 175,415.

Gettysburg. A town of southern Pennsylvania, located about 35 miles southwest of Harrisburg. Gettysburg occupies a picturesque site in a hilly but fertile farming country. President Eisenhower, bought a farm here shortly after his election.

In the vicinity was fought, July 1-3, 1863, one of the most decisive battles of the Civil War. Here the Union army under General Meade defeated the Confederate forces under General Lee. The entire battlefield, comprising 3409 acres, has been converted into a national military park, in which are marked the sites where particular actions took place; a cyclorama painting within a circular building depicts the battle. On Cemetery Hill is the National Cemetery, dedicated by Lincoln in his famous Gettysburg Address. An eternal light peace memorial was dedicated on the battlefield by President Roosevelt in 1938. Population, 1970, 7275.

Glendale. A city of southern California, adjoining Los Angeles on the north. Its elevation varies from 400 feet to 2400 feet. It is a popular residential suburb, but has rapidly expanding industrial interests which include pottery, electronic equipment, and drugs. A feature of particular interest in Forest Lawn Memorial Park, the court of which has a stained glass window design copied from Da Vinci's "Last Supper." Glendale was incorporated in 1906. Population, 1970, 132,752.

Gloucester (*glŏs'tẽr*). A seaport of northeastern Massachusetts, built on the south side of the Cape Ann peninsula, about 30 miles northeast of Boston. The city is an important fishing port, with a large fleet engaged in taking cod, haddock, halibut, redfish, and mackerel. There are various other industries, largely connected with the fisheries. By reason of its picturesque location, quaint, old-fashioned streets, and interesting historic associations, the city is a favorite travel and summer resort, especially for artists. A well-known piece of sculpture there is the famous Fisherman's Memorial. Gloucester was founded in 1623, incorporated in 1642, and became a city in 1874. Population, 1970, 27,941.

Gloversville. A city of east central New York, noted as the chief glove manufacturing center in the United States. Its factories, together with those of the neighboring town of Johnstown, produce a substantial percentage of the gloves made in the country. The leather glove industry is said to have been first introduced into the United States by Sir William Johnson, who, in 1760, settled several families of Scotch glove makers on his lands near the site of Gloversville. Other manufactured products include silk and knitted goods, phonograph records, leather, and lumber. Population, 1970 19,677.

Grand Canyon of the Colorado. The most magnificent scenic spectacle of its kind in the world. This immense gorge, the greatest example of stream erosion known, has been cut by the Colorado River in the high plateau of northern Arizona. The deeper portion is 217 miles long; its vast chasms range from 4000 to 6000 feet in depth from the uppermost rim to the river; and its width from rim to rim varies from 4 to 18 miles.

The canyon consists of two distinct parts: the broad, outer, upper portion, which has been eroded through stratified rocks; and the narrow, inner, lower portion, which has been worn down through unstratified rocks. The outer or upper walls are carved in alternating layers of limestones, sandstones, and shales. These descend in successive benches or escarpments, displaying a multitude of beautifully castellated, temple-like forms, banded in splendid colors, and finally reach the top of the gloomy inner gorge. This is irregularly cut in tough dark granite, and, at its bottom, extending usually from wall to wall flows the foaming, torrential river.

The descent throughout the entire length of the canyon is so great that the river is broken into many rapids and semirapids. These, rushing between almost vertical walls of rock, make navigation, even for the staunchest boats, exceedingly dangerous. The current rolls great boulders along the bottom of the narrow channel, and, at some points, the noise of their grinding in the rocky river bed can be heard above the roaring of the waters.

The most impressive portion of the canyon is included in Grand Canyon National Park. Its area, 1052 square miles, embraces 105 miles of the Grand Canyon, stretching from east to west from its beginning at the mouth of the Little Colorado River. From rim to rim this part of the canyon is from 8 to 15 miles wide; it is more than a mile deep measured from the north rim, which averages nearly 1000 feet higher than the south rim. The eastern boundary includes the lofty, richly colored walls east of which lies the Painted Desert. The western boundary of the park includes the broad Cataract canyon, entering from the south. In this tributary canyon is the Havasupai Indian reservation and a group of five waterfalls.

The first white man to see the Grand Canyon was Cardenas, a member of Coronado's party, who, in 1540, visited the south rim. The first successful passage of the Grand Canyon by boat was made in 1869 by Major John Wesley Powell. An isolated plateau known as Shiva's Temple, believed to have been cut off in the glacial age 12,000 to 35,000 years ago, was explored for the first time in 1937 by Dr. Harold E. Anthony who conducted an investigation into the effects produced on animal life there by its long separation from outside influences.

Grand Coulee Dam. One of the largest dams in the world, backing up the Columbia River in Washington into a lake that extends 151 miles to the Canadian border. The height of the dam is 553 feet and its length is 4200 feet. Into its construction went 11.5 million cubic yards of concrete, an amount of construction unmatched by any other engineering work. The dam is designed to produce 1,974,000 kilowatts of electricity and to irrigate 1,250,000 acres of land. The cost of the dam and power plant, opened in 1941, was 181 million dollars. An additional 209 million dollars was allocated to irrigation canals.

A peculiarity of the dam is that, to be useful for irrigation, a reservoir of water must be created 280 feet above the level to which the dam raises the river. Power developed at the dam is used to pump water into such a reservoir, which, when full, is 23 miles long and covers 2300 acres.

Grand Junction. A city of southwestern Colorado, 255 miles southwest of Denver, at the junction of the Colorado and the Gunnison rivers. Located in the midst of uranium-producing industries, it is also the commercial center of a fertile farming and fruit growing district, watered by a large irrigation canal. The city lies 4600 feet above sea level, and is surrounded by some of the most noted scenic points in Colorado, notably Colorado National Monument and Grand Mesa. Population, 1970, 20,170.

Grand Rapids. A city of Michigan, built on both banks of the Grand River, about 150 miles west of Detroit. The city takes its name from the rapids of the river, which here descends 18 feet in about a mile. While maintaining numerous important industries, Grand Rapids is noted chiefly as a center for the manufacture of furniture. Although exceeded in volume by New York and Chicago, Grand Rapids is distinguished for the design, quality, and finish of its product. In the heart of the city there are large exposition buildings for displaying furniture samples for wholesale buyers.

Among other leading manufactures are automobile parts, carpet sweepers, house furnishings, chemicals, textiles, and gypsum plasters. Public parks cover 1245 acres.

Grand Rapids was settled in 1833, became a village in 1838, and a city in 1850. Educational institutions include Aquinas and Calvin colleges. Population, 1970, 197,649.

Great Falls. The leading manufacturing city of Montana, picturesquely situated at the Great Falls of the Missouri River, about 100 miles north of Helena. The development of immense hydroelectric power in the center of a rich mining and agricultural region has been the chief factor in the growth of the city's manufactures.

Among the leading industrial establishments are copper reduction works, smelting and refining works, and flour and cereal mills. The city is also an important market for wool, shipping several million pounds annually. The municipal park system embraces 48 parks with a total area of 952 acres. Great Falls is a "jumping off" point for motorists driving north to connect with the Alaska Highway. Population, 1970, 60,091.

Great Salt Lake. A salt-water lake in northwestern Utah. Situated at an altitude of 4218 feet above sea level, it has an area of about 1750 square miles with a maximum length of 75 miles and a width of from 30 to 50 miles. Its mean depth is about 20 feet with a maximum of 40 feet. The lake has no outlet, but is fed by the Jordan, Weber, and Bear rivers. Variations in rainfall have a very pronounced effect on its size and on its salinity, the latter fluctuating from 12 to 27 per cent accordingly as the water is high or low. Since the salinity of the ocean is about 3.44 per cent, Great Salt Lake is from four to six times as salty as the ocean. Common salt is the chief mineral constituent of the water, and its recovery is the basis of an active industry. Sodium sulphate and gypsum are also obtained. It is impossible for a bather to sink in the water of the lake.

Great Salt Lake was first accurately described by John C. Frémont in 1845. Geological observations indicate that the lake is the shrunken remnant of an inland sea, Lake Bonneville, which, centuries ago, covered some 20,000 square miles. Great Salt Lake contains nine islands, the longest being 16 miles in length. It is crossed by the Southern Pacific railroad over the Lucin cutoff, a trestle and gravel fill about 27 miles long.

Greeley. A city of northern Colorado, 50 miles north of Denver, on the Cache la Poudre River. It is situated in a fertile agricultural district, and its industries are chiefly based on agriculture. They include sugar refining, flour milling, cold storage warehousing, and canning. Named for Horace Greeley, the place was settled in 1870 by the "Union Colony," composed mainly of New England people. By establishing irrigation, these pioneers transformed an almost barren wilderness into a highly productive region. Greeley is the seat of the University of Northern Colorado. Population, 1970, 38,902.

Green Bay. A city of eastern Wisconsin on high level ground on both sides of the Fox River where it empties into Green Bay, an arm of Lake Michigan. Dating from 1745, it is the oldest settlement in Wisconsin, and Tank Cottage, in Washington Park, is said to be the oldest house in the state. Paper manufacture is prominent among the varied industries. The city is a busy port, shipping chiefly cheese, grain, and fish, and receiving coal, sulphur, steel, and motor cars. Green Bay became a city in 1854. Population, 1970, 87,809.

Greensboro. A manufacturing city in the north central part of North Carolina. The chief products are textiles, cigarettes, machinery, furniture, and hosiery. The city is spacious and open, with 425 acres of parks. It is the seat of Guilford College and two colleges for women—Greensboro and North Carolina. Greensboro was founded in 1809 and named for General Nathanael Greene, hero of the battle of Guilford Court House, which is memorialized by a national military park six miles to the northwest. Population, 1970, 144,076.

Greenville. A city of northwestern South Carolina, built on the banks of the Reedy River, about 110 miles northwest of Columbia. Greenville is an important textile manufacturing center and contains many large cotton mills. Other industrial establishments include foundries, dye works, and garment, textile machinery, and furniture factories. Greenville is the seat of Furman University. Population, 1970, 61,208.

Greylock, Mount. The highest summit in Massachusetts, situated in the Berkshire Hills, on the western border of the state, about 5 miles southwest of North Adams. The broad, flat top, which rises to an elevation of 3500 feet, is accessible by highway and by many beautiful trails. A tract of about 8600 acres on the upper part of the mountain has been purchased by the state for a permanent park.

Gulfport. A port, city, and resort of southeastern Mississippi, on Mississippi sound, an arm of the Gulf of Mexico. It is about midway between New Orleans and Mobile. The shore is protected by a 26-mile concrete sea wall surmounted by a four-lane scenic highway. Gulfport is the second largest banana terminal in the world and also receives sugar, hemp, and other products. It ships locally produced chemicals and fertilizer. Population, 1970, 40,791.

Hagerstown. A city of western Maryland, built on Antietam Creek, 72 miles northwest of Baltimore. It is the trade center for a large agricultural district and has extensive and varied industries. The city's industrial products include silk and knit goods, shoes, pipe organs, aircraft, cement, fertilizers, and sheet metal. In the vicinity are Fort Frederick and the battlefields of Antietam and Gettysburg. Population, 1970, 35,862.

Hamilton. A manufacturing city of southwestern Ohio, on the Miami River, 25 miles north of Cincinnati. Its principal manufactures are machinery, machine tools, paper, stoves, office fixtures, safes and bank vaults, engines, and woolen goods. The city is said to have been the first in the country to own its waterworks, gas plant, and electric light plant. Hamilton was the boyhood home of novelist William Dean Howells. Population, 1970, 67,865.

Hammond. A city of northwestern Indiana, on Lake Michigan, 18 miles southeast of the center of Chicago, of which it is an industrial suburb. Hammond arose as a packing center, George Hammond having established a plant there in 1868. After 1900, steel and railroad car manufacture became of chief importance, and immense oil refineries were built. Other industries include printing, bookbinding, and the making of railroad equipment and chemicals. Population, 1970, 107,790.

Hamtramck (*hăm-trăm'ĭk*). A city of southeastern Michigan, existing as an island municipality within the city of Detroit. Hamtramck owes its rapid growth to the immense development of automobile industries. The city has extensive manufactures of automobile accessories, iron and aluminum castings, wheels, radiators, brass goods, and paints. Population, 1970, 27,245.

Hannibal. A city of northeastern Missouri, situated on the Mississippi River, about 120 miles above Saint Louis. It is the trade center of an agricultural district, and there are coal mines in the vicinity. The chief manufactures include Portland cement, lime, structural steel, lawn mowers, and food products. Hannibal was settled in 1819 and became incorporated in 1839. During boyhood, Mark Twain lived in Hannibal, and his early home is the property of the city. A statue of him stands in the 200-acre Riverview park. The Mark Twain memorial bridge spans the Mississippi at Hannibal. Population, 1970, 18,609.

Harpers Ferry. A historic town 60 miles northwest of Washington in the extreme eastern part of West Virginia, where the state line borders Virginia and Maryland. It occupies a site of remarkable scenic beauty at the junction of the Shenandoah and Potomac rivers, at the point where the latter stream flows through a gap in the Blue Ridge Mountains. Here, in 1859, John Brown attempted his famous raid. During the Civil War, the town was alternately in the possession of the Union and of the Confederate forces. In 1944, it was authorized as a National Monument, and in 1963, made a National Park. Population, 1970, 423.

Harrisburg. The capital of Pennsylvania, situated on the Susquehanna River, in the southeastern part of the state. The city is noted for its diversified manufactures, chiefly of steel and of steel products, and for the extensive railway roundhouses, repair shops, and freight yards, which have made Harrisburg a great distribution center.

The most beautiful of the city's fine buildings is the State Capitol. This impressive edifice, constructed of steel and faced with granite and marble, and decorated with elaborate sculptures, was erected at a cost of $13,000,000. East of it lies Memorial Park, where there are four monumental-type office buildings and a half-mile viaduct in memory of Pennsylvanians who served in the World Wars. Since 1900, extensive civic improvements have won for Harrisburg the sobriquet of the "Model City." The park system covers 1100 acres, of which 666 acres are included in the picturesque Wildwood Park. A beautiful riverside park and boulevard borders on the Susquehanna.

Harrisburg was named for John Harris, an English trader, who settled on its site in 1719. It was incorporated in 1791, and in 1812 became the capital of the state. Population, 1970, 68,061.

Hartford. The capital of Connecticut, built on the west bank of the Connecticut River, in the north central part of the state. The city occupies a commanding site on rolling ground, affording fine views of the Connecticut valley.

Hartford is laid out with wide, well shaded streets and beautiful boulevards. The city is noted for its artistic homes and for its excellent public buildings. In the old State House, designed by Bulfinch, the Hartford Convention of 1814 met. The State Capitol adjoins Bushnell Park, and nearby are the State Library and Supreme Court Building, the State Office Building, the State Armory, Bushnell Memorial Hall, and the Soldiers' and Sailors' memorial arch. Five highway bridges span the Connecticut River.

Its important industries include the manufacture of firearms, typewriters, brushes, precision tools, oil burners, and counting devices. For a long period, Hartford has been one of the leading insurance centers of the country, containing the home offices of nearly 50 companies. The Travelers Insurance Company tower is 527 feet in height. Hartford is the seat of Trinity College and the Wadsworth Atheneum, said to be the oldest free public art museum in America. It has a famous municipal rose garden and celebrates a rose festival annually.

Prior to the settlement of the town in 1635–36 by English colonists from Massachusetts Bay under the leadership of Reverend Thomas Hooker, the Dutch had a trading post and fort at Hartford. Here, in 1639, were drawn up and adopted the "Fundamental Orders of Connecticut," said to be the first written constitution of modern times. In 1687 occurred the attempt of Governor Andros to seize the charter of the colony, and its alleged concealment in the famous "Charter Oak." Hartford was the capital of Connecticut colony until 1701, when it was made joint capital with New Haven. In 1873, Hartford became the sole capital of the state. Population, 1970, 155,868.

Haverhill (*hā'vĕr-ĭl*). A manufacturing city of northeastern Massachusetts, built on both banks of the Merrimack River, about 30 miles north of Boston. Haverhill is one of the chief centers in the United States for the manufacture of boots and shoes. The city was settled in 1640–41 and almost since its founding has been noted for the manufacture of shoes. It now makes about one-sixth of all the women's shoes produced in the United States. The city contains many fine parks, lakes, and drives; also many handsome residences and public buildings. It is the birthplace of John Greenleaf Whittier. Population, 1970, 46,120.

Helena (*hĕl'ĕ-nà*). The capital of Montana, situated in the west central part of the state. The city overlooks an arable valley, the scene of extensive cattle raising, and is surrounded by a mountainous region, rich in gold and other valuable metals. Helena was founded by mining prospectors in 1864 on Last Chance gulch and was incorporated in 1881. From this gulch gold was extracted to the value of $40 million. The industries include lead and zinc smelting.

The per capita wealth of the inhabitants is very high and is reflected in the many fine residences of the city. Among the chief buildings are the State Capitol, the Federal Building, Consistory Temple, Civic Center and Saint Helena Cathedral. Especially noteworthy are the Veterans' and Pioneers' Memorial Building and the Russell Art Gallery. Many points of scenic interest exist in the neighborhood, notably the "Gates of the Mountains," named by Lewis and Clark in 1805. The educational institutions include Carroll College. Population, 1970, 22,730.

Hibbing. A mining village of northeastern Minnesota, in the center of the state's Mesabi Iron Range, 75 miles north of Duluth. It is the site of the world's largest open-pit iron-ore mine and the nation's only "triple divide" watershed. The Greyhound Bus Company originated here in 1914. Population, 1970, 16,104.

Highland Park. A city of southeastern Michigan completely within Detroit, of which it is an industrial suburb. Highland Park was at one time the headquarters of the Ford Motor Company and owes its growth largely to the automobile industry. In 1900, it was a village of 427 inhabitants. Population, 1970, 35,444.

High Point. A manufacturing city of central North Carolina, 99 miles northwest of Raleigh. It is the chief southern center for the manufacture of furniture. The Southern furniture exposition, held there four times annually, is visited by buyers from all parts of the United States. Other important industrial products include textiles, tile, and tobacco. Population, 1970, 63,204.

Hoboken (hō'bō-kĕn'. A manufacturing city of northeastern New Jersey. It is situated on the Hudson River opposite New York, with which it is connected by ferries, and the Holland and Lincoln vehicular tunnels. Hoboken is a large seaport, and is the terminus of several important transatlantic steamship lines. Its industrial output includes coffee, marine equipment, furniture, and pencils. The city is the seat of the Stevens Institute of Technology. The first steam-propelled ferry-boat was invented and put in operation at Hoboken. Population, 1970, 45,380.

Hodgenville. A town of central Kentucky, situated about 50 miles almost due south of Louisville in a fertile region devoted to growing grain, tobacco, and live stock. Three miles distant from the town is the national historic site, Abraham Lincoln Birthplace. Here a beautiful memorial building preserves the log cabin in which President Lincoln was born. Population, 1970, 2562.

Hollywood. A residential and winter resort community in southeastern Florida, 18 miles north of Miami, and 7 miles south of Fort Lauderdale. It has two yacht basins and Port Everglades, a port of entry for southern Florida. Industry is growing in the city, and there are numerous citrus groves in the area. Hollywood was founded in 1921 and incorporated as a city in 1925. Population, 1970, 106,873.

Holy Cross, Mountain of the. A high peak of the Rockies, 30 miles northwest of Leadville, Colorado. The emblem from which this mountain takes its name appears about midsummer. At that time the snow has melted from the higher slopes and ridges and is retained only in two deep canyons, which, by their intersection, form an immense cross high up on the side of the mountain. This white cross remains in view until late autumn, when the entire crest is again covered with snow.

Holyoke (*hol'yok*). A planned industrial city of southwestern Massachusetts, built on the west bank of the Connecticut River, 97 miles southwest of Boston. Immense water power, derived from falls in the river, promoted the rise of extensive industries. These are concerned chiefly with the manufacture of paper, paper products, and textiles. Holyoke is one of the largest producers of fine writing papers and envelopes in the United States. Because of the number and size of its mills, it has long been styled the "Paper City."

The total value of the city's paper products is, however, exceeded by that of its textile products. These include cotton and woolen goods, thread, knit goods, alpaca, and silk. Among other important manufactures are machinery, blank books, and school supplies. Mount Tom and Mount Holyoke are among the many points of interest in the vicinity. Population, 1970, 50,112.

Homestead. A manufacturing city of western Pennsylvania, located on the Monongahela River, about 7 miles southeast of Pittsburgh. Its chief manufacture is steel, and its vast steel plants rank among the largest in the country. Among the "Homestead steel mills," in and around Homestead, is the Carnegie-Illinois strip steel mill, costing 60 million dollars, one of the largest of its kind in the world. Homestead was settled in 1871 and in 1880 was incorporated. Population, 1970, 6309.

Honolulu (*hŏ'nō-lōō'lōō*). The capital and chief commercial center of Hawaii, situated on a good harbor on the south coast of Oahu. Honolulu is noted for its delightful climate and for its luxuriant tropical gardens. It possesses fine clean streets, spacious open squares, and many handsome public buildings. The University of Hawaii, a state institution, is located in Honolulu.

Representative of the city's industries are pineapple canneries, sugar factories, iron foundries, and artificial ice plants. The native population is industrious and self-supporting. Honolulu occupies a vantage ground of immense importance on the trade routes of the Pacific, and, from a strategic point of view, is of great value as a naval station of the United States. Honolulu harbor was discovered in 1794. The modern town was founded in 1816, and in 1820 it was made the capital of the islands. The population is composed of a mixture of various races, among which predominate Hawaiians, Japanese, Chinese, and Portuguese. Population, 1970, 324,871.

Hood, Mount. A peak of the Cascade range in northern Oregon, about 50 miles east of Portland. It is of volcanic origin and rises symmetrically to a height of 11,225 feet, the loftiest elevation in the state. The lower slopes are forested but the peak is snow capped and there are glaciers on the upper slopes. The summit, which may be ascended without serious difficulty, commands magnificent views of the Columbia River valley and also of many great peaks of the Cascades, including mounts Rainier, Adams, and Jefferson.

Hood River. A town of northern Oregon on the Columbia River, 67 miles east of Portland. It is the trade center and shipping point of the Hood River valley, which extends southward 25 miles to Mt. Hood. This valley, protected by Cascade ranges and provided with a constant flow of gravity-irrigation water, is excellently adapted to fruit growing. Hood River apples and pears are famed throughout the continent and command maximum prices. The Bonneville Dam, 24 miles down the Columbia River, backs the water up to Hood River, thus forming a pool for water sports and recreation. Population, 1970, 3991.

Hoquiam (*hō'kwĭ-ăm*). A city of western Washington, situated on Gray's Harbor, about 90 miles by rail southwest of Tacoma. It adjoins Aberdeen, with which it shares the distinction of being one of the greatest seaports of the world for shipment of forest products. The industries include lumber mills. wood product factories, and fisheries. Population, 1970, 10,466.

Hot Springs. A health and travel resort, located in central Arkansas 53 miles southwest of Little Rock. The city is picturesquely situated in a narrow valley sheltered by two ridges of the Ouachita Mountains. It surrounds Hot Springs National Park, celebrated for its numerous hot springs having valuable medicinal properties. There are numerous large hotels, sanitariums, and sumptuous

bathhouses. Hot Springs Medical Center is one of the tallest buildings in Arkansas. The resort is nearly surrounded by Lakes Catherine and Hamilton, created by power dams in the Ouachita River. Population, 1970, 35,631.

Houston (*hūs'tŭn*). A city of Texas, situated in the southeastern part of the state. It is about 50 miles northwest of Galveston, on a sluggish stream formerly known as Buffalo bayou. This has been widened and deepened into a canal called the Houston ship channel, which permits large ocean steamers to reach the city's wharves.

Houston is the commercial center of a rich agricultural and lumbering region and is one of the world's richest oil producing territories. The city is one of the greatest cotton markets and ports in the United States. In manufactures Houston ranks first among the cities of the state. Its varied industries include petroleum refining, sugar, rice and flour milling, and the manufacture of fertilizers, cement, and chemicals.

The city is laid out with wide, shaded streets, beautiful parks, handsome residences, and imposing public and commercial buildings. The Humble Oil and Gulf buildings are among the tallest in the south. Houston is the seat of Rice University, the University of Houston, and the University of St. Thomas, and has a magnificent Museum of Fine Arts. Houston's Astrodome, built at a cost of $31.6 million, was the world's first air-conditioned all-weather stadium. Its plastic dome is 208 feet high. Houston was settled after the battle of San Jacinto, which was fought near its site in 1836. Incorporated in 1837, it became the capital of the former republic of Texas in 1840. Population, 1970, 1,231,394.

Huntington. A city in West Virginia, located on the Ohio River in the western part of the state. It lies in a rich coal and oil producing region and is an important trade and manufacturing center. It has extensive railroad shops and manufactures nickel, clay products, textiles, optical goods, and mining cars. Huntington is the seat of Marshall College. Population, 1970, 74,315.

Huntsville. An historically interesting city in northern Alabama. In 1811, its earlier name of Twickenham was changed to honor John Hunt, early settler and Revolutionary soldier. At present Huntsville's typical industrial activities are overshadowed by its contribution to America's space program through the Redstone Arsenal. Population, 1970, 137,802.

Imperial Valley. A former desert area in southeastern California, which has been made remarkably productive by irrigation. It lies east and south of the Salton Sea and extends southward to the Mexican border. The improved district is about 40 miles long, with a maximum breadth of 30 miles, and embraces a total area of approximately 500,000 acres.

Water for irrigation is taken from the Colorado River near Yuma, and conducted to the south end of the valley. Thence it is distributed in a network of waterways covering the district. The soil is largely composed of the silts of an ancient delta of the Colorado river. It is of unmatched and seemingly of inexhaustible fertility. Owing to the warm climate and almost continuous sunshine, the growing season is not only very long but also very rapid. By rotation, two or more crops a year are often produced from the same field.

The Imperial Valley has become widely noted for the production of long-staple cotton of unexcelled quality. The district produces also immense quantities of melons, lettuce, asparagus, onions, grapes, oranges, and various other vegetables and fruits. Date culture on a commercial scale is becoming established.

Independence. A city in the western part of Missouri, located in an agricultural district adjacent to Kansas City. Recently, it has become well known as the home of President Harry S. Truman and the site of the Harry S. Truman Library. In an earlier period it was important as a supply point for caravans of pioneers who were going west over the Oregon Trail or the Santa Fe Trail. Population, 1970, 111,662.

Indianapolis. The capital of Indiana, situated on the White River, near the center of the state, about 185 miles southeast of Chicago. In population, transportation facilities, and volume of business transacted, Indianapolis is a major wholesale and retail trade center.

The city occupies a nearly level site, is regularly laid out, for the most part with broad streets, and is substantially and handsomely built. Indianapolis, preeminently a city of homes, is widely noted for its advantages as a residential city.

The park system, which embraces a total area of more than 4564 acres, contains 90 parks. Of these, Eagle Creek, is the largest, covering some 2600 acres. The soldiers' and Sailors' Monument, in Monument Place, a lofty shaft of stone and bronze, 285 feet high and richly decorated with sculptures, is one of the notable military memorials in America. Among numerous fine buildings are the Capitol, the Federal Building, the Riley Public Library, Christ Church, the Indianapolis Art Museum, the Scottish Rite Cathedral, and Indiana State Library. A 15-million dollar World War Memorial Plaza occupies five blocks in the downtown district of the city. The principal structure is the magnificent Shrine Building. A cenotaph stands in the north square at the head of a mall two blocks long. In the northeast corner is a four-story building of Greek architecture which houses the national headquarters of the American Legion. The city's educational institutions include Butler University, Indiana Central College, several professional schools of Indiana University, and several schools of Purdue University.

Indianapolis owes its prominence largely to three important advantages. First, it is the center of a large and highly productive agricultural region; second, it lies near immense supplies of coal, insuring cheap fuel, and third, it possesses unusually excellent transportation facilities. The city is served by numerous railway and air lines radiating in all directions and by very extensive truck and bus systems. A feature for which the city is widely noted is the Indianapolis Motor Speedway. Among the chief industries are meat packing and the manufacture of drugs, motor vehicle engines and parts, aircraft engines, refrigerators, electrical and telephone equipment, television and radio sets, apparel, furniture, and inner tubes for tires.

The site on which the city is located was selected for the state capital and named Indianapolis in 1821. The legislature first met there in 1825. Population, 1970, 743,155.

Inland Empire. A name popularly given to a rich agricultural, stock raising, and mining region of the northwestern United States, lying between the Rocky and the Cascade mountains. It embraces a considerable part of the Columbia River plateau, including eastern Washington, northeastern Oregon, the northern part or "panhandle" of Idaho, and the extreme western part of Montana. The chief railway and commercial center in this large region is Spokane.

Iowa City. A city of eastern Iowa, on the Iowa River, about 120 miles east of Des Moines. The city is primarily a college community (the seat of the State University of Iowa) in the midst of a rich farming and cattle-raising region. The university has excellent medical-research departments cooperating with local hospitals to provide medical service for the state. This city was once the capital of the Territory of Iowa, and from 1846 to 1857 was capital of the state of Iowa. Population, 1970, 46,850.

Irvington. A town of northeastern New Jersey. It is a residential suburb of New York and Newark, which it adjoins on the southwest. It has various industries, including foundries and facilities for the manufacture of chemicals, tools, plastics, and electronic equipment. Settled in 1692, it was called Camptown until 1852, and was then renamed in honor of Washington Irving. Its incorporation as a village dates from 1835, and, as a town, from 1898. Population, 1970, 59,743.

Isleta (*ĕs-lā'tă*). An Indian town situated on the west bank of the Rio Grande River, about 10 miles south of Albuquerque, New Mexico. The present town was founded early in the 18th century.The inhabitants, who are of Tanoan Indian stock, retain much of their aboriginal social organization. By primitive means of irrigation, they produce from an arid soil excellent crops of corn, fruits, and vegetables. Population, 1970, 1080.

Itasca (*ī-tăs'kă*), **Lake.** A small lake in north central Minnesota. It consists of three long narrow arms, from the northern one of which emerges the Mississippi River. The region immediately surrounding the lake, embracing an area of about 35,000 acres, has been made a state park. Its waters abound in many kinds of fish, beavers are abundant, and a band of elks has been established in the park.

Ithaca. A city of west central New York, located at the south end of Cayuga Lake, about 40 miles south of Syracuse. While the city conducts a substantial trade and maintains various local industries, it is noted chiefly as the seat of Cornell University, with which is connected the New York State Agricultural College. This important educational institution occupies a magnificent campus on East Hill, an eminence rising about 400 feet above the lake and lower city, and commanding unexcelled views of a highly picturesque region. Ithaca was founded in 1789, and was chartered as a city in 1888. Population, 1970, 26,226.

Jackson. A city of southern Michigan, built on both banks of the Grand River, about 70 miles west of Detroit. Jackson is an important railway center, and is situated in the midst of a rich agricultural region. It carries on an extensive trade in grain, fruit, and vegetables, and has substantial industries. The city's manufactures include automobile parts, tires, machine tools, machinery, airplane wheels, and food products. Nearby is a cascade 500 feet long and 64 feet high which is illuminated each

night in summer. Jackson was settled in 1829, became a village in 1843, and a city in 1857. The Republican party was organized and named at Jackson in 1854. Population, 1970, 45,484.

Jackson. The capital of Mississippi, located on the Pearl River, about 40 miles east of Vicksburg. Possessing both railway and water transportation, Jackson has become a commercial center for agricultural and manufactured products, with an extensive trade in cotton. The chief local industries include cottonseed oil mills, foundries, lumber mills, and woodworking shops. Among the prominent public buildings are the Capitol and the Carnegie Library. Jackson is the seat of Millsaps College, Belhaven College, and the James Observatory.

The site of Jackson was chosen for the state capital in 1821. During the Civil War, Jackson was the scene of many conflicts, and in 1864 was largely destroyed by General Sherman. Population, 1970, 153,968.

Jackson. A city of western Tennessee, about 80 miles northeast of Memphis. Jackson is the trade center of a rich farming and fruit growing district, is an important cotton and fruit market, and has substantial local industries. Among the city's manufactures are cotton goods, cottonseed oil, lumber, aluminum products, and furniture. Jackson is the seat of Union University and of Lambuth and Lane colleges. Population, 1970, 39,996.

Jacksonville. A city and commercial center of Florida, situated on Saint Johns River, about 27 miles from its mouth. It has an excellent harbor, with a 30-foot channel to the ocean, and carries on an extensive coastwise and foreign trade in lumber, cotton, phosphates, fruits, and vegetables. The leading industries include shipbuilding and the manufacture of fertilizers, lumber, cigars, chemicals, and naval stores; also fruit packing, crab meat packing, and spice milling.

The city's streets, parks, and private residences are rendered attractive by the luxuriance of semi-tropical vegetation. By reason of its mild climate and nearby ocean beaches, Jacksonville is a favorite winter resort. Population, 1970, 518,131.

Jamestown. A manufacturing city of western New York, about 75 miles southwest of Buffalo. Jamestown occupies a hilly site on the outlet of Chautauqua Lake, with abundant water power. It is a leading center for the manufacture of furniture. Other important industries make bearings, automatic voting machines, metal office furniture, and automobile parts. The city is also an important dairy center. Population, 1970, 39,795.

Jamestown. The first permanent English settlement in the United States. It was founded in 1607 on the banks of the James River, in Virginia, about 32 miles above its mouth, and nearly opposite the present town of Williamsburg. The first legislative assembly held in America met at Jamestown in 1619, and here, in the same year, slaves were first introduced into the colonial territory.

During Bacon's Rebellion, 1676, Jamestown was burned to the ground. It was rebuilt and remained the capital of Virginia until 1698, when it was again destroyed by fire and was never reconstructed. The site of the settlement, originally a peninsula, later became an island. Of the former town, there remain only the ruins of the tower of the church of 1639, but the old church has been reconstructed, the foundations of many early structures have been exposed and marked, lot lines and streets have been re-defined, and a modern Visitor Center containing exhibits and an orientation film has been added.

Jefferson City. The capital of Missouri, situated on the south bank of the Missouri River, about 110 miles west of Saint Louis. The city is a trade and commercial center of a rich farming district and contains large railway shops. The chief manufacturing interests include shoe factories, flour mills, machine shops, and foundries. A fine steel bridge spans the Missouri at Jefferson City. Among prominent buildings are the State Capitol, erected at a cost of $4,215,000, the State Supreme Courthouse, and the State Office Building. The site was chosen for the state capital in 1821, the town was laid out in 1822, and the legislature first met here in 1826. Population, 1970, 32,407.

Jersey City. A city of New Jersey, built on the west bank of the Hudson River. It occupies 20.2 square miles directly opposite lower New York City, with which it is connected by four tubes under the Hudson and by the Holland vehicular tunnel.

Jersey City is the terminus of a large number of railroads, which link it with the South and West. As a shipping and receiving port, it is probably second in importance to New York. Among its numerous manufactures are electrical and scientific apparatus, jewelry, musical instruments, soap, radios, and drugs.

The city has many notable public buildings and several parks. John F. Kennedy Boulevard, 19 miles long and 100 feet wide, follows the crest of Bergen Hill, extends past West Side Park, and gives a splendid view of the river and upper New York. Population, 1970, 260,545.

Johnstown. A manufacturing city in southwestern Pennsylvania, about 75 miles east of Pittsburgh. Johnstown is located in a picturesque valley at the foot of the Allegheny Mountains, in a rich coal mining and iron producing region.

The city is one of the leading centers in the state for the manufacture of steel and steel products. Other manufactures include silk, radios, radiators, and paint. Johnstown has 230 acres in 14 public parks. On May 31, 1889, as a result of a flood caused by the bursting of a dam on the south fork of the Conemaugh River, Johnstown was largely destroyed and 2000 lives were lost. A reminder of this tragic occurrence is the Unknown Plot in Grandview Cemetery, where 777 unidentified victims of the flood are buried. Prompt outside aid was extended, and the city was soon rebuilt and its industries re-established. Population, 1970, 42,476.

Joliet (*jō'lĭ-ĕt*). A manufacturing city of northeastern Illinois, situated on the Des Plaines River, about 40 miles southwest of Chicago. The manufacture of steel products, chiefly rods and wire, and of wall paper are major industries. Other products include refined oil, chemicals, and stoves. The American Institute of Laundering is located there. Joliet is also noted for its quarries of fine building stone, known as Joliet limestone. Population, 1970, 80,378.

Juneau (*jo͞o'nō*). The capital of Alaska, and the supply center of mining, fishing, and lumbering camps. It is situated on a good harbor on the Gastineau Channel, in the "panhandle" portion of southeastern Alaska. Huge quantities of salmon, halibut, and other fish are shipped, mainly within the United States. A decline in gold mining has been accompanied by a growth of the pulp and lumber industry and fur farming. Population, 1970, 6050.

Kalamazoo. A manufacturing center of southwestern Michigan, in a rich agricultural district. Principal industries include metal working and the manufacture of pharmaceuticals, paper, printing machinery, and paper boxes. The city is the seat of Western Michigan University and Kalamazoo and Nazareth colleges. Population, 1970, 85,555.

Kansas City. A city of Kansas, built on both banks of the Kansas River at its junction with the Missouri. It lies adjacent to Kansas City, Missouri, with which communication is facilitated by a two-mile intercity viaduct connecting the higher levels of the cities. It is the second greatest live stock market and meat packing center in the United States. Flour milling is second in importance among the city's extensive industries, which include petroleum refining, soap making, car repairing, and the manufacture of structural ironwork, boxes, chemicals, cooperage, and fertilizers. Parks cover 330 acres, and nearby is Wyandotte County Park of 1400 acres with a 333-acre lake created by an earthen dam. First settled as a trapping post in the 1820's, it became a gateway to the West and was incorporated as a city in 1889. Population, 1970, 168,213.

Kansas City. A city of Missouri on the western border of the state, some 230 miles west of Saint Louis. It occupies a commanding site on the south bank of the Missouri River, at its junction with the Kansas River. The city is built on three levels, in a landscape of high bluffs. Kansas, City, Mo., and Kansas City, Kans., though separate in government, form a continuous settlement at the center of a six-county metropolitan area. Because of its location near the geographical center of the United States and its excellent transportation facilities, including an international airport, Kansas City is one of the most important warehousing and distribution centers in the United States.

Known for its leadership in agricultural enterprise, the city also has a strong and diversified industrial base and ranks high as a center for consulting engineering firms. Also important are its wheat market, cold storage facilities, production of vending equipment, distribution of vending machinery, and automotive assembly plants. Chief industrial products are refined oil, iron and steel products, paints, and chemicals.

Among prominent buildings are the municipal auditorium, city hall, the federal building, and the Nelson Gallery of Art. Here also are the Kansas City Philharmonic Orchestra, the Museum of History and Science, the Midwest Research Institute (operating in 20 fields of science), the Hall Library of Science and Technology, and the University of Kansas City. Population, 1970, 501,859.

Katahdin (*kȧ-tȧ'dĭn*), **Mount.** The highest mountain in Maine, located in Piscataquis county, slightly northeast of the center of the state. It rises to an elevation of 5267 feet, with precipitous slopes and massive cliffs of richly colored granite. The bare summit furnishes a grand view of forests, rivers, lakes, and mountains.

Kennedy, Cape. A cape on Florida's east coast midway between Jacksonville and Miami where the U.S. government maintains a launching site for space explorations. Its name was changed from Cape Canaveral in honor of President Kennedy after his assassination in 1963. In 1973 the cape was renamed Cape Canaveral. The space launching facility will still be known as the John F. Kennedy Space Center.

Kenosha (*ke-no'sha*). A city of fine homes and choice industrial sites in southeastern Wisconsin, overlooking a fine harbor on Lake Michigan, 34 miles south of Milwaukee. The city's extensive industries include the manufacture of automobiles, brass and copper products, tools, stainless steel fittings, wire rope, hosiery, and knit goods. Population, 1970, 78,805.

Key West. The southernmost city of continental United States, situated on Key West Island, one of the Florida Keys. This small coral island lies in the Gulf of Mexico, about 50 miles southwest of Cape Sable, Florida. It is connected with the mainland by an overseas highway built, in part, upon the chain of low islands, of which Key West is the terminal, and, in part, upon huge concrete causeways connecting the islands. There are large shipping interests and important fisheries. Population, 1970, 27,563.

Kings Mountain. A ridge 100 feet high and a mile long in South Carolina, about 30 miles southwest of Charlotte, N. C. Here on October 7, 1780, a British force of 1100 troops was defeated and captured by less than 1000 mountaineers, who thereby spoiled the strategy of Cornwallis and prepared the way for victory at Yorktown.

Knoxville. An industrial and educational center in eastern Tennessee, built on the north bank of the Tennessee River, about 160 miles east of Nashville. It lies between the Cumberland and Great Smoky mountain ranges in a rich coal mining, iron producing, and marble quarrying region, with which it conducts an extensive trade. Knoxville's industrial products include textiles and clothing, iron and steel products, furniture, plastics, and marble. The city is the seat of the University of Tennessee and Knoxville College. It is headquarters of the Tennessee Valley Authority. Population, 1970, 174,587.

La Crosse. A city of western Wisconsin, on the Mississippi River at the mouth of the La Crosse and Black rivers. Its site is on level ground extending about 2½ miles back from the Mississippi to bluffs which command fine views. Lumber manufacture, formerly the leading industry, has been replaced by a great variety of new industries including the manufacture of motor car instruments and farm machinery. It is the trade center for a rich dairying district. The numerous lakes, picturesque crags, and winding valleys nearby make La Crosse a popular center for tourist travel. Population, 1970, 51,153.

Laguna (*lä-gōō'nä*). The second largest Indian pueblo in New Mexico, located near the San Jose River, in an arid desert, 67 miles west of Albuquerque. The inhabitants, who are of Keresan stock, are industrious and self-supporting. By primitive methods of irrigation, they produce crops sufficient for their needs. Wool also is grown.

Lake Charles. A city of southwestern Louisiana, situated on the lake of the same name, about midway between New Orleans and Houston. It is an important seaport, connected with the Gulf of Mexico by a 33-mile deep-water channel. Principal industries are oil refining and chemical manufacturing. McNeese State College is located here, and just north of the city is the 1220-acre Sam Houston Park. Population, 1970, 77,998.

Lake Geneva. A summer resort town of southern Wisconsin, situated on a lake of the same name, about 40 miles southwest of Milwaukee. The lake is a fine body of water, 9 miles long and from 1 to 3 miles wide. Many residents of Chicago have villas on its shores. The town is the seat of a large sanitarium and a military school. Nearby is Yerkes Observatory, containing the great Yerkes 40-inch refracting telescope. Population, 1970, 4890.

Lake George. A small lake in eastern New York, one of the most picturesquely beautiful in America. It is fed chiefly by cold springs, and its waters flow into Lake Champlain through a series of cascades, with one abrupt fall of 30 feet at Ticonderoga.

Lake Mohonk (*mō-hŏngk'*). A popular summer resort, charmingly situated on a small lake of the same name in the Catskill Mountains, of Ulster County, about 75 miles north of New York City. Lake Mohonk is noted also as the seat of a long series of annual conferences on international arbitration, the first of which was held in 1895

Lake Placid. A beautiful small lake in the Adirondacks of northeastern New York. It is situated at the foot of Whiteface Mountain, some 10 miles northeast of Mount Marcy. The lake lies at an altitude of about 2000 feet.

Lakewood. A city of northern Ohio on Lake Erie and adjoining the western limits of Cleveland, of which it is a residential suburb. Lakewood was incorporated in 1911. Population, 1970, 70,173.

Lancaster. A city of southeastern Pennsylvania, about 65 miles west of Philadelphia. Lancaster is the trade center of one of the most productive tobacco and grain growing counties in the United States, and has varied and extensive industries. It is noted for its output of watches, umbrellas, locks, linoleum, cork, silk goods, cotton goods, and leather. Franklin and Marshall College and the Theological Seminary of the Reformed Church are located here. First settled in 1718, Lancaster became the center of a progressive community whose important historic contributions include the Pennsylvania rifle and the Conestoga wagon. It was the home of James Buchanan, 15th president of the United States. Population, 1970, 57,690.

Lansing. The capital of Michigan, built at the junction of the Grand and Cedar rivers, about 85 miles northwest of Detroit. Power developed from these streams is utilized in the city's extensive industries. In value of manufactures, Lansing stands fourth among the cities of the state. Of its industries, the manufacture of automobiles is the most important. Other manufactures are machine shop products and chemicals. Among important public buildings are the new capitol and the Lansing Public Library. Parks cover 1802 acres. East Lansing is the seat of Michigan State University. Lansing was settled in 1837, was laid out for the capital in 1847, and became a city in 1859. Population, 1970, 131,546.

Laredo (*le,ra'do*). A city of southern Texas, on the Rio Grande River, opposite Nuevo Laredo, Mexico, and connected with it by two international bridges. It is the largest port of entry on the U.S.-Mexico border, the distribution center for an area rich in petroleum production, cattle raising, and truck crops. Laredo is a tourist attraction with historical interest. It was founded in 1755 by the Spanish. Population, 1970, 69,024.

Lassen Peak. A volcanic mountain in northern California, situated at the north end of the Sierra Nevada range, about 135 miles north of Sacramento It stands at the extreme southwestern border of the great ancient lava beds which cover more than 200,000 square miles in the Columbia River plateau.

Long inactive and regarded as extinct, Lassen Peak in 1914 began to emit immense clouds of steam and smoke. An area of 167 square miles surrounding and including Lassen Peak has been created a national park. In this are smaller volcanoes, lava fields, cinder cones, fumaroles, hot springs, solfataras, boiling lakes, and other features characteristic of a volcanic region.

Las Vegas. A city in Nevada, located in the southeastern tip of the state. Having advantages of climate and nearness to points of scenic interest, such as Hoover Dam, it has become known as a residential, tourist, and convention city, specializing in entertainment for visitors. Its industries serve the AEC Nevada Test Site and other U.S. bases. Population, 1970, 125,787.

Lawrence. A city in eastern Kansas, on both banks of the Kansas River, about 40 miles west of Kansas City. Lawrence is the trade center of a rich agricultural region and has various local industries, including flour mills, pipe organ and box factories, nurseries, and canning works. It is the seat of the University of Kansas, and the Haskell Institute for Indians is also located here. Founded in 1854 by settlers from New England, Lawrence was the first of the Kansas Free State towns, and became an anti-slavery stronghold. It was sacked by a band of bush rangers from Missouri in 1856. In 1863, Quantrell, the Confederate raider, attacked the town, killing more than 100 of its citizens. Population, 1970, 45,698.

Lawrence. A manufacturing city of northeastern Massachusetts, built on both sides of the Merrimack River, about 26 miles north of Boston. The Merrimack Falls of the river at this point originally played an important part in building up the city's industries. In the production of worsted cloth, Lawrence leads all other cities of the United States. Here are located the huge mills of the American Woolen Company as well as the Pacific and Arlington mills Other manufactures include foundry and machine shop products, shoes, and paper. Population, 1970, 66,915.

Leadville. A mining city of central Colorado, located near the Continental Divide, at an elevation of 10,200 feet. First settled by gold prospectors in 1860, it was a prosperous gold mining center for a few years until the deposits at that time known were exhausted. Thereupon the place was practically abandoned. In 1877, exceedingly rich lead and silver ore bodies were discovered. As a result, the population, which had declined to about 300, increased to more than 6000 in 1878, and to about 35,000 in 1879. For a time thereafter, Leadville held first place in the United States in lead and silver production. During the period

1879–1940, the total value of its mineral output exceeded $550 million. Mineral production has declined to a small fraction of its former value. Nearby is a mine producing most of the world's molybdenum. Population, 1970, 4314.

Lewiston. A leading manufacturing city of Maine, built on the east bank of the Androscoggin River opposite the city of Auburn, about 35 miles north of Portland. The river here falls 60 feet; at the five million dollar Gulf Island dam it furnishes immense hydroelectric power which is utilized in the city's extensive industries. The chief manufacturing establishments are cotton and woolen mills, shoe factories, dye works, and bleacheries. The city is the seat of Bates College. Population, 1970, 41,779.

Lexington. The chief city of the "Blue-Grass region," situated about 80 miles southeast of Louisville. It is located in a highly productive agricultural and stock-raising district and is an important market for grain, tobacco, and livestock, especially thoroughbred horses. Lexington, named for the first battle of the Revolutionary War, is surrounded by beautiful countryside. It is the seat of Kentucky University, Transylvania University, and other educational institutions. It is also the site of a U.S. Veterans' Hospital and a U.S. hospital and farm for the treatment of drug addicts. Lexington was the home of Henry Clay, Mary Todd Lincoln, and General John Hunt Morgan. Population, 1970, 108,137.

Lexington. A town of northeastern Massachusetts, situated about 12 miles northwest of Boston. Lexington village, now chiefly residential, is noted as the scene of the first conflict between the colonists and the British in the Revolutionary War. In the village and its vicinity are many points of great historic interest. Among these are the first battleground of the Revolution; numerous houses, taverns, and other buildings associated with the conflict; and various monuments in commemoration of the men and of the events that made Lexington famous. Lexington was settled about 1642 and for some 50 years was known as Cambridge Farms. In 1839, the first normal school in the United States was opened in Lexington. Population, 1970, 31,886.

Lima. A city of western Ohio and center of oil pipe lines, located on the Ottawa River, 79 miles south of Toledo. Among its chief industrial products are cigars, locomotives, power shovels, electric motors, diesel engines, bus bodies, and steel castings. Population, 1970, 53,734.

Lincoln. The capital and second largest city of Nebraska, situated on a gently sloping site, about 55 miles southwest of Omaha. It is the center of a productive agricultural and stock-raising section, with which it carries on an extensive trade. The industrial products include food products, chemicals, brick, cement, and machinery. The city is regularly laid out, with wide streets. The Capitol is among the great architectural achievements of America. Parks, numbering 42, cover 4028 acres.

Lincoln is the seat of the University of Nebraska, Wesleyan University, and Union College. Fairview, the estate of William Jennings Bryan, is used as a hospital. The first permanent settlement on the site of the city was made in 1856, and in 1864 a village was laid out, called Lancaster. This, in 1867, was selected for the state capital and renamed Lincoln. Population, 1970, 149,518.

Lincoln Highway. A road extending entirely across the northern United States and named in honor of Abraham Lincoln. It was laid out in 1913 with the purpose of establishing a modern vehicular highway, national in character and free to the public at all points, connecting New York and San Francisco. For most of its length, the road is now known as U.S. 30 (Philadelphia to Salt Lake City). From Utah across Nevada into California, it is replaced by U.S. 50.

Little Rock. The capital and largest city of Arkansas, on the Arkansas River, near the center of the state. The name has reference to a bold cliff rising 50 feet above the river at this point. The city is the commercial center of a rich lumbering and cotton-growing district. It became an inland port in 1968 as part of the $1.2 billion Arkansas River Navigation Project. Two new navigation locks and dams are located only a short distance from the city. There are many fine public buildings, among which is the Capitol, built of native Arkansas marble. The park system covers 400 acres. Because of its profusion of roses, Little Rock is often called the "City of Roses." The city is the seat of Little Rock University and the University of Arkansas schools of medicine, nursing, pharmacy, and law. Population, 1970, 132,483.

Lockport. A city of western New York, situated on the State Barge canal, 26 miles northeast of Buffalo and in the center of the highly productive Niagara fruit belt. It occupies a commanding though somewhat uneven site, part of the city being built on a sloping terrace known as "Mountain Ridge." At this point the canal drops some 66 feet, from the level of Lake Erie to that of the Genesee River, by massive locks of masonry, and is crossed by one of the widest bridges in the world. The varied industries include numerous manufactures, notably automobile parts and pulpwood products, chemicals, and high-grade steel. There is a large trade in fruit and grain. The Niagara County Historical Center is located here. Population, 1970, 25,399.

Logan. A city of northern Utah, on Logan River, about 70 miles north of Salt Lake City. Logan is the commercial center of the Cache valley, a rich agricultural district, with some mineral deposits. Its industrial establishments include flour mills, cheese plants, and beet sugar and knitting factories. Utah State University is located there, and a Mormon temple with grounds of great beauty overlooks the city from a hilltop. Population, 1970, 22,333.

Long Beach. An industrial and tourist center on the coast of California, 22 miles south of Los Angeles. It is beautifully located, looking out on the harbor of San Pedro, while the beach from which it takes its name is one of the finest along the Pacific coast. Its harbor, elaborately improved, is the base of the Pacific battle fleet. It accommodates a large trade in fruit, canned fish, petroleum, and lumber, the last two being the chief products of the city's industry. Petroleum is extensively produced within the city limits and is used as fuel for an electric generating plant, one of the largest on the continent. Population, 1970, 358,633.

Lookout Mountain. A steep ridge which rises to an elevation of 2100 feet, overlooking the city of Chattanooga, Tennessee. This rocky height was the scene of the famous battle of the Civil War, sometimes called the "Battle above the Clouds." The summit commands a superb view of the Tennessee River and its valley, the city of Chattanooga, and the surrounding mountainous region.

LOS ANGELES (*lōs ăng′ gĕl-ĕs*; *lŏs ăn′jĕl-ĕs*). The chief commercial center of southern California and the third most populous city in the United States, Los Angeles is situated on the Pacific coast, about 475 miles southeast of San Francisco and about 10 miles south of the Sierra Madre mountains. Through it passes the Los Angeles River, a dry bed in summer but a considerable stream in winter.

Site. The city lies, for the most part, in a gently sloping plain, with an average elevation of about 270 feet. The site is fairly level, though there are a few steep eminences, and the northern suburbs extend into the foothills. Including extensions to the ocean and taking in San Pedro harbor, the total area of the city exceeds 457 square miles.

Streets and Buildings. The city is regularly laid out, with wide, straight streets, and an extensive system of boulevards and drives. About the old Plaza is the civic center, which includes the $10 million City Hall with a 464-foot tower surmounted by the Lindbergh beacon. Near the plaza is the union station, an $11 million structure. The railway terminals and manufacturing districts lie chiefly to the east and south of the business center, while the large and handsomely built residence sections flank it on the west and north. Los Angeles is preeminently a city of beautiful homes, with the Mission style of architecture, adopted from the Spanish, and the bungalow as characteristic types. The broad avenues and spacious grounds are luxuriant with evergreen foliage and a profusion of flowers which bloom throughout the year.

Parks and Boulevards. There are 112 public parks embracing a total area of more than 9600 acres. Among the more noteworthy of these are Griffith, Elysian, Westlake, Lincoln, Echo, Hollenbeck, Exposition, Central, and Plaza parks. Griffith park, a hilly, wooded tract of 4109 acres, is one of the largest municipally-owned parks in the United States. Many handsome boulevards and driveways connect the parks with various parts of the city and with fine scenic roads to the ocean, fruitful valleys, and mountain wildernesses.

Educational Institutions. Los Angeles is the seat of the University of Southern California, the University of

California at Los Angeles, Occidental College, Loyola University, and Los Angeles City College, The Museum of History and Science in Exposition Park, has a large display of skeletons of extinct animals. The County Museum of Art and the Music Center of the Performing Arts are recent additions to Los Angeles' cultural attractions.

TRANSPORTATION. Los Angeles owes its great growth in part to unusually complete transportation facilities. The city contains terminals of three transcontinental railways which enter the magnificent Union Station, completed in 1939 at a cost of $11 million. There is also a capacious harbor for coastwise and foreign shipping in its municipally-owned wharves at San Pedro. It is connected with the surrounding country by a system of bus lines, some of which reach towns 60 miles distant. Well paved public freeways form a huge network over country districts in all directions. One of the finest is the Arroyo Seco Parkway. These serve as thoroughfares for extensive regularly operated systems of autobuses and autotrucks.

COMMERCE. Los Angeles is the commercial center of the far Southwest and has extensive fruit growing, petroleum producing, manufacturing, and shipping interests. Its foreign and intercoastal shipping vies with that of New York City. The chief imports are lumber and raw materials such as rubber, silk, coffee, and cacao. Exports are largely petroleum and other minerals, food products, and factory goods. The city is a general market for one of the most productive horticultural and agricultural sections of the country. Among leading products handled are oranges, lemons, walnuts, olives, vegetables, beet sugar, beans, cereals, and cotton. Citrus fruits and petroleum are the chief products of the immediate district.

MANUFACTURES. By reason of cheap fuel, in the form of crude petroleum, and abundant hydroelectric power derived from the Hoover Dam, Los Angeles has grown at a prodigious rate as a manufacturing city. The motion picture industry is the best known. Hollywood, the chief center of this industry, is famous throughout the world. The Los Angeles area leads the country in aircraft manufacture. Other important manufactures include petroleum and metal products, lumber, packed meats and other food products, and furniture. The outdoor life and the importance of the motion picture industry have made Los Angeles a style center for sports and other clothes, and the manufacture of women's clothing has become a large industry.

FEATURES OF INTEREST. With its picturesque setting between the mountains and the sea, its numerous historic associations, and its many attractive suburbs, Los Angeles presents an immense number of points of interest. Among those within the city are the Old Plaza Church, China City and Chinatown, Griffith Observatory and Planetarium, Memorial Coliseum, with a seating capacity of 105,000, and the Hollywood Bowl, seating 18,000, Dodger Stadium, the Pilgrimage play, Radio Center, and La Brea pits in Hancock Park. In the near vicinity are San Gabriel Mission with its Mission Play theater, Mount Lowe, and Mount Wilson Observatory, Huntington Library and Art Gallery, and Palos Verdes hills. Attractive beach resorts include Santa Monica, Venice, Redondo Beach, Long Beach, and Santa Catalina Island. Interesting suburban cities include Pasadena, Riverside, Alhambra, Universal City, Glendale, Orange, Pomona, and San Bernardino.

HISTORY. In 1781, Los Angeles was settled by Spanish colonists from Mexico who named it *El Pueblo de Nuestra Senora la Reina de Los Angeles* (the City of Our Lady the Queen of the Angels). Until its final capture in 1847 by United States troops under General Stephan W. Kearny, it served alternately with Monterey as capital of the Mexican province of California.

Los Angeles was chartered as a city in 1850, and attained its first railway connection with San Francisco in 1876. Following the completion, in 1885, of the Santa Fe railway, giving direct access to the East, the growth of Los Angeles was rapid.

The genial climate, the great fertility of the surrounding region under irrigation, and large local supplies of natural gas and petroleum have been influential factors in this development. Two important municipal achievements have also contributed substantially to its rise as a great city. The first was the extension, in 1909, of the city to the ocean at San Pedro, making possible the establishment of a commodious, municipally controlled harbor. The second was the completion, in 1913, at a cost of $25 million, of a great aqueduct from the slopes of Mount Whitney in the Sierra Nevada, across the Mojave desert, and through the Sierra Madre range, by tunnel, to the city. In the 1930's, water from the Colorado River was made available through a 250-mile aqueduct, 108 miles of which was tunneled through the rock, the total cost being $220 million. A third source of supply was secured with the completion of the Mono Basin project in 1940 at a cost of $20 million. Population, 1970, 2,816,061.

Louisville (*loo'i-vil*). The chief city of Kentucky, located on the south bank of the Ohio River, 110 miles south of Cincinnati. Louisville occupies a commanding site opposite the rapids or "falls" of the river, at which point is an enormous fossil reef containing what is said to be the world's only exposed relic of the Devonian era, dating from 300 million years ago. A system of locks and dams has recently been added in the falls area.

The city's park system covers some 2177 acres. Cherokee Park, 409 acres, is cut into ravines by Beargrass Creek. Iroquois Park, the largest, 676 acres, rises to eminences of nearly 300 feet, affording views of the city and of the river.

Louisville has excellent transportation facilities by air, expressway, rail, and the Ohio River. It is the commercial center of a large agricultural region. Its leading manufactures include tobacco products, electrical appliances, farm implements, packed meats, whiskey, railroad cars, sanitary plumbing supplies, and gasoline. It leads the U.S. in the production of bathtubs, baseball bats, hickory handles, and wagons. The city is the seat of the University of Louisville and other educational institutions. It is widely known as the site of the Kentucky Derby and the Kentucky State Fair.

The town of Louisville was laid out and named in 1779 and became a city in 1828. Its growth, favored by river traffic, was greatly stimulated by the completion, in 1830, of the Louisville and Portland canal around the rapids. Near the city is the home and the grave of Zachary Taylor. Population, 1970, 361,472.

Lowe, Mount. A peak of the Sierra Madre in southern California. It is situated some 15 miles in direct line northeast of Los Angeles and rises to an elevation of 5650 feet above sea level. An electric scenic railway ascends almost to the summit, which affords superb views of the surrounding region.

Lowell. A manufacturing city of northeastern Massachusetts, situated at the junction of the Merrimack and Concord rivers, about 30 miles northwest of Boston. While electronics has replaced textiles as the main industrial base (many of the textile mills having moved south), manufactures are diversified, including food products, shoes, medicine, clothing, plastics, and paper products. Various civic improvements have recently been made within the city. Lowell is the seat of Lowell Technological Institute and Lowell State College. It is the birthplace of the artist James McNeill Whistler, whose home is now a museum. Population, 1970, 94,239.

Lubbock. A city in the Great Plains area of Texas, 295 miles northwest of Fort Worth. Located in a rich oil region, it is also in the center of an agricultural section whose major products are cotton, cottonseed, and sorghum. Principal educational institution, Texas Technological University. Population, 1970, 149,101.

Luray Cavern. A remarkable cave, situated near the town of Luray, Virginia, in the foothills of the Blue Ridge mountains. There are numerous galleries, rising above one another in tiers to a height of nearly 300 feet. Some contain stalactites and stalagmites of great size and unusual beauty of coloration. The cavern was discovered in 1878.

Lynchburg. A city of central Virginia, on the James River, 112 miles west of Richmond. The city is picturesquely located, sloping in steep terraces upward from the river, with the Blue Ridge and the Peaks of Otter as background. It is situated in a tobacco producing district, of which it is the trade center. Power developed from the river is utilized in various local industries, chiefly in the manufacture of shoes and clothing. Educational institutions include Randolph-Macon Woman's College and Lynchburg College. Population, 1970, 54,083.

Lynn. A manufacturing city of eastern Massachusetts, located about 10 miles northeast of Boston. The city is beautifully situated and admirably laid out. The commercial and industrial districts extend for about 3 miles along Massachusetts Bay, on which the city has a well-developed harbor, while the residential sections occupy the higher portions overlooking the harbor.

Lynn is one of the chief centers in the United States for the manufacture of women's and children's shoes. The city has other important industries, chiefly the manufacture of electrical machinery, jet engines, measurement devices, adhesives, boxes, and proprietary medicines. Lynn was settled in 1629 but was known as Saugus until 1637, when it was given its present name. Its great shoe industry had its beginnings about 1750. Population, 1970, 90,294.

McKeesport. A manufacturing city of Pennsylvania, on the Monongahela River, 14 miles southeast of Pitts-

burgh. Advantageously situated in a region rich in bituminous coal, iron, and natural gas, the city has become a leading center for the manufacture of iron and steel. It possesses one of the greatest steel tube and iron pipe works in the world, which has earned for it the name of the "Tube City." Among other industrial products are chromium sheet, tools, and other steel products. Population, 1970, 37,977.

Macon (*mā'kŏn*). A city of central Georgia, built at the head of navigation on the Ocmulgee River, about 80 miles southeast of Atlanta. Macon is the commercial center of a highly productive farming and fruit district, and is a leading market for peanuts, pecans, and peaches. Hydroelectric power, derived from the river, is utilized in the city's extensive industries, which include the manufacture of cotton and knit goods, cottonseed oil and cottonseed cake, brick, tile, lumber, flour, fertilizers, foundry and machine shop products, and packed meats. Macon has a municipal auditorium with a huge copper dome.

The city is the seat of Mercer University and Wesleyan College. Macon was first settled in 1822 and was incorporated as a city in 1832. It was the home of the poet Sidney Lanier. Population, 1970, 122,423.

Madison. The capital of Wisconsin, situated in the south central part of the state. The city occupies a picturesque site between lakes Mendota and Monona, in the so-called "Four-Lakes region." It is surrounded by a rich agricultural district, of which it is the trade and industrial center. Madison is noted for its beautiful parks, wide, heavily shaded streets, and scenic lake shore drives. Its industrial output includes meat and dairy products, dry cell batteries, and machine tools. There are many fine public buildings, the most imposing of which is the capitol, built of granite in the Renaissance style.

The city is the seat of the University of Wisconsin, which occupies a magnificent campus, more than a mile in length, bordering on Lake Mendota. Madison has a United States forest products laboratory, opened in 1910, the first in the world. The site of Madison was chosen for the state capital in 1836. Population, 1970, 173,258.

Malden. A city of eastern Massachusetts, built on the Malden River, 5 miles north of Boston. Malden is noted for its extensive manufactures of rubber boots and shoes, and contains some of the largest rubber shoe factories in the United States. Among numerous other manufactures may be mentioned knitted goods, soap, paints, chinaware, and precision instruments. Malden was first settled in 1641, was incorporated in 1649, and was chartered as a city in 1881. Population, 1970, 56,127.

Mammoth Cave. The second largest known cavern in the world, being exceeded in size only by Carlsbad Cave in New Mexico. Situated near the Green River, about 100 miles south of Louisville, Kentucky, it is located in a region which abounds in large caverns and whose surface is marked by thousands of sink holes. Through these depressions, drainage waters find their way to underground streams whose solvent and erosive action has largely produced the caves.

To the geologist, the cave is a laboratory and museum inexhaustibly rich in materials for the study of rock formations and the effects of erosion. For the tourist, the processes of geologic change have created a picturesque setting unlimited in interest and variety. In the St. Louis limestone, a layer of soluble rock capped by sandstone and sometimes reaching a thickness of 300 feet, underground waters have carved a series of pools and streams that are bordered by cathedral-like rooms and ornamental passageways. The walls are lined, not only with the usual rows of stalactites and stalagmites, but also with a panorama of symmetrical statues and grotesque gargoyles.

In more matter-of-fact terms, Mammoth Cave may be described as a complex series of caverns, including more than 200 so-called rooms, chambers, domes, pits, abysses, grottoes, avenues, and galleries, which extend for 9 miles underground. In the lower portions, there are rivers, waterfalls, and small lakes. Among the most interesting features are the vast pits or domes, which are caverns of unusual height. The largest of these, called the Chief City, is 450 feet long and 130 feet wide.

Cleveland Avenue, which extends for fully 2 miles, presents wonderful displays of crystals and incrustations. Stalactites and stalagmites in a great variety of grotesque shapes, many of which resemble architectural forms. When the incrustations are covered with crystals, as in Star Chamber, their sparkling effect when the cavern is lighted is impressive. Among the larger bodies of water within the cavern are the so-called Dead Sea, the Styx, Lethe Lake, Roaring River, and Echo River.

In the waters of the cave are 2 species of blind fish. These, together with crayfish and a few insects, make up the animal life. The temperature remains almost constant at about 54°. The cavern was discovered in 1809 by a hunter named Hutchins. In 1936, a tract including the site of the cave was created Mammoth Cave National Park, covering over 80 square miles.

Manchester. A city of New Hampshire, built on the Merrimack River, 18 miles south of Concord. A fall of some 50 feet in the river, formerly used as direct water power, now provides one of the units in a superpower system. The city's extensive industrial output includes cotton textiles, worsted dress goods, rayon mixtures, shoes, brushes, and cigars. The city has many fine parks, municipal buildings, and educational institutions, including the Manchester Institute of Arts and Sciences and the Currier Art Gallery. Recreation is provided by 35 parks. Population, 1970, 87,754.

Manitou (*măn'ĭ-tōō*) **Springs.** A health and pleasure resort, located at the foot of Pikes Peak, 6 miles northwest of Colorado Springs, Colorado. The town lies at an elevation of about 6300 feet in a region noted for picturesque scenery. The numerous features of interest in the locality include Pikes Peak, the Cave of the Winds, Soda Springs Park, the Garden of the Gods, and various canyons, Cliff Dwellers' ruins, waterfalls, and scenic drives. The famous radioactive mineral springs flow at the rate of a quarter million gallons daily. The summer population is estimated at 25,000. Resident population, 1970, 4278.

Mansfield. A city of north central Ohio, situated in an agricultural region, about 65 miles northeast of Columbus. Its manufactures include appliances, brass products, tires, and plumbing products. Of interest in and around Mansfield are two winter ski resorts; a monument to Johnny (Chapman) Appleseed, who is said to have used his influence to save the settlement from Indians; the Richland County Museum; Malabar Farm, a successful experiment of novelist Louis Bromfield's from the 1930's in farming on ecological principles; and Kingswood Center, a beautiful exhibit of flora and fauna. Population, 1970, 55,047.

Marcy, Mount. The loftiest summit of the Adirondack mountains and the highest peak in the state of New York. It is situated about 10 miles south of Lake Placid, and 30 miles southwest of Lake Champlain. It is a dome-shaped mountain rising to an elevation of 5344 feet. The slopes, except near the summit, are generally wooded. The summit and a portion of the upper northern slope are above timber line. The vegetation above the zone of trees consists of dwarfed and stunted heaths and willows and other plants peculiar to an arctic-alpine vegetation.

Marietta. The oldest town in Ohio, was founded, 1788, by General Rufus Putnam, acting for the Ohio Company. Located at the junction of the Ohio and Muskingum rivers, the city has enjoyed a flourishing river trade and a substantial industrial development. Its chief manufactures are furniture and metal products. It is the site of Marietta College. Population, 1970, 16,861.

Marion. A city of central Ohio, situated 44 miles north of Columbus, in a rich agricultural and limestone quarrying region. The city's extensive industries include the manufacture of power shovels, steel products, road rollers, farm implements, conveying machinery, cereal products, and electric refrigerators. Marion has many fine streets and buildings. The city was the home of President Harding. His tomb stands near the city within a circular colonnade surrounded by a beautifully landscaped tract of 100 acres. Population, 1970, 38,646.

Medford. A city of eastern Massachusetts, 5 miles northwest of Boston, of which it is a residential and manufacturing suburb. Medford was founded in 1630. It has some of the oldest examples of colonial architecture, including Wellington House, dating from 1657, and the Cradock House, built 1677–80. Medford is the seat of Tufts University, which has a campus of 80 acres. Population, 1970, 64,397.

Memphis. The chief city of Tennessee, built on the east bank of the Mississippi River, about 210 miles southwest of Nashville. The city occupies an undulating site, on Chickasaw bluff, about 450 miles by river south of Saint Louis and 740 miles by river north of New Orleans.

At Memphis, the river is spanned by three immense cantilever bridges, and railways radiate from the city in all directions. Because of its advantageous situation on the Mississippi River, in a rich agricultural and lumbering region, Memphis has become an important marketing, manufacturing, and distributing center. It is the chief center of hardwood lumber production in the United States, and is the principal inland cotton market of the South. The city's varied and extensive industries include the manufacture of cottonseed oil and cake, food preparations, lumber, cooperage, window screens, flavoring extracts, television sets, drugs, and automobile tires. The city owns its electric generating and distribution system.

Memphis is regularly laid out, with wide, well shaded streets and handsome residences, and contains many excellent public and commercial buildings. The city's park system, connected by a boulevard 11 miles long, is one of the finest in the South. This system covers a total area of 2500 acres. Important units are Riverside Park, 349 acres, and Overton Park, 357 acres, the latter containing an art gallery and a large zoological garden.

The city is the seat of Memphis State University and of the medical and law schools of the University of Tennessee. Memphis was laid out in 1818 by General Andrew Jackson and associates. It was incorporated in 1826, and, in 1849, received its charter as a city. Population, 1970, 623,497.

Meriden. A heavily industrialized city of Connecticut, 18 miles from Hartford, surrounded by a truck-farming region. It is the home of the International Silver Company, largest manufacturer of sterling and plated silverware in the world. Other manufactures include aircraft products, electronics, plastics, and printing presses. Population, 1970, 55,959.

Meridian. The second largest city of Mississippi, in the east central part of the state. It is the market center of a rich cotton, vegetable, and cattle district. The principal industries include the manufacture of cottonseed oil, cotton gins, lumber, bricks, knitted goods, and airplane tail assemblies. Population, 1970, 45,083.

Miami (*mī-ăm'ĭ*). A commercial and year-round resort city on the lower east coast of Florida on the shores of Biscayne Bay, an inlet of the Atlantic Ocean.

The second largest city in Florida, Miami is in a subtropical region of luxuriant vegetation, producing grapefruit, oranges, limes, guava, pineapples, avocados, mangoes, and coconuts. It is an important center for shipping fruit and winter vegetables to northern markets. Light industry has become increasingly important to Miami's development in recent years, with products ranging from novelties to garments, metal products, and furniture.

Miami, a terminus for two rail lines, has steamer connections with Nassau and other Caribbean ports. The Miami International Airport is said to handle more foreign cargo than any other airport in the United States. Its $26 million terminal was dedicated in 1958, and the $30 million Port of Miami, in 1967.

In adjacent Coral Gables is the University of Miami. Politically, Miami is the hub of a rapidly growing metropolitan center comprised of 27 municipalities, whose activities are co-ordinated by a central county government housed in the 27-story Dade County Court House. Population, 1970, 334,859.

MILWAUKEE. The chief city of Wisconsin. It is situated on Lake Michigan 93 miles north of Chicago. Its area is 96 square miles.

Site. Milwaukee occupies a commanding site overlooking Lake Michigan. Within the city three small rivers join before emptying into the lake—the Milwaukee from the north, the Kinnickinnic from the south, and the Menomonee from the west.

Streets and Buildings. Noteworthy streets include Lincoln Memorial Drive on the shore of Lake Michigan and Wisconsin Avenue, the leading business thoroughfare. MacArthur Square is the civic center plaza around which various public buildings are grouped.

Prominent among the city's imposing edifices is the Municipal Auditorium and Arena, comprising eight halls and covering an entire city block. Other impressive buildings include the City Hall, the Courthouse, the Federal Building, the Public Library, the Art Gallery, the Public Museum, and Northwestern Mutual Life Insurance Building.

Parks. The park system of Milwaukee covers about 1300 acres. Among its 100 units are Mitchell Park, noted for its floral displays; Washington Park, containing a fine zoological garden; and Gordon Park, with recreational facilities.

Commerce. The city's harbor is protected by a long breakwater. Its facilities are well suited to the handling of increased commerce resulting from the opening of the St. Lawrence Seaway. Shipping trade is very extensive and embraces an immense tonnage of coal, grain, and manufactured products. The transportation facilities include several railroad, steamship, bus, and airplane lines, and also a daily car ferry service which transports railroad trains to the east shore of Lake Michigan.

Industry. Milwaukee is one of the leading industrial centers of the country, ranking among the first ten cities of the United States in value of manufactures. These include hosiery, electrical control apparatus, power shovels, electric generators, automobile frames, packed meats, railway cars, engines, beer, shoes, and knit goods.

Educational Institutions. Milwaukee has many educational institutions, including Marquette University; University of Wisconsin, Milwaukee; Mount Mary College; and Cardinal Stritch College.

History. The site of Milwaukee was visited in 1673 by Fathers Marquette and Joliet. The first permanent settlement dates from 1818. The village was organized in 1837, and, in 1845, it became a city. Population 1970, 717,099.

MINNEAPOLIS. The chief city of Minnesota, built on both banks of the Mississippi River, at the Falls of Saint Anthony. Immediately below lies Saint Paul, which adjoins Minneapolis.

Site. Minneapolis attained industrial and commercial importance primarily by reason of the immense water power derived from the falls. This was first utilized principally in sawmills and flour mills. Until about 1870, lumber was the leading product, but since that date the milling of grain has become a pre-eminent industry. One of the great mills situated around the Falls of Saint Anthony is the largest single flour mill in the world. Other important manufactures are linseed oil, cereal foods, agricultural implements, machinery, knit goods, and dairy products. Over recent years, Minneapolis is being recognized as one of the leading centers of electronics equipment manufacturing.

The city is served by 29 railroads, 10 of which are trunk lines, and stands at the head of navigation on the Mississippi River. By reason of its extensive transportation facilities, Minneapolis has become the wholesale distributing center for the Northwest. It is also one of the chief wheat markets of the country.

Minneapolis is predominantly a city of homes, with wide, well shaded streets, handsome residences, charming parks, and beautiful drives. The park system, containing 153 parks, covers 5897 acres. It includes Lake Calhoun, Lake Harriet, Lake of the Isles, Lake Nokomis, Cedar Lake, and 17 smaller lakes and lagoons. By means of canals connecting several lakes, a scenic waterway 9 miles long has been made available for canoes and launches. Minnehaha Park contains the beautiful Minnehaha ("falling water") Falls, immortalized by Longfellow. Here Minnehaha Creek, the outlet of Lake Minnetonka, plunges over a 50-foot cliff just before joining the Mississippi.

Buildings. There are many notable buildings, among them the Public Library, the City Hall, the Art Institute, the Pro-cathedral, Saint Mark's Church, Hennepin Avenue Methodist Church, the Federal Reserve Bank, the 32-story Foshay Tower, the $4 million Post Office, and the Minneapolis Auditorium. Another feature of the city is the large number of handsome bridges across the Mississippi River. The city is the seat of the University of Minnesota, De La Salle Institute, Dunwoody Institute, Augsburg Seminary, the MacPhail and Minneapolis schools of music, and the Minnesota Symphony Orchestra.

History. Father Hennepin, a French missionary, discovered and named the Falls of Saint Anthony in 1680. In 1766, the site of the city was visited by Jonathan Carver, an American traveler, and, in 1805, by Lieutenant Z. M. Pike, who purchased the site of Fort Pike from the Indians. Fort Saint Anthony, later called Fort Snelling, was established in 1819. The first sawmill at the falls was erected in 1822 to provide lumber for the fort. The village of Saint Anthony, on the east side of the river, was incorporated in 1855, and Minneapolis, on the west side, in 1856. In 1872, the two places were united. Population, 1970, 434,400.

Missoula (*mĭ-zōō'lă*). A city of western Montana, on the Clark Fork River, about 125 miles by rail northwest of Helena. It is the distributing center for a large farming and fruit growing, lumbering, and mining region, and is the seat of the University of Montana. The National Bison range and the extensive Flathead Indian reservation lie to the north of the city. Population, 1970, 29,497.

Mitchell, Mount. The highest point in the state of North Carolina, and the loftiest summit of the eastern United States. It is a massive, dome-shaped mountain, sometimes called Black Dome, rising to an elevation of 6684 feet, with many high cliffs and precipitous slopes. It is named for Elisha Mitchell, a distinguished scientist who lost his life while attempting, in 1857, to scale the mountain. A large tract of land, including the summit and surrounding spruce forests, has been created a state park, which provides accommodations for travelers.

Mobile. The second largest city and only seaport in Alabama, located on Mobile Bay, 26 miles north of the Gulf of Mexico. It is a leading cotton market and has varied industries, among them shipbuilding, cotton, lumber, and paper mills, chemical and steel factories, oil refineries, and seafood canneries. The harbor has been elaborately improved, and the bay is spanned by the Cochrane bridge. The Bankhead tunnel beneath the Mobile River accommodates vehicular traffic. The chief exports include logs, hewn timber, pine lumber, rosin, cotton, paper, metals, machinery, and coal; the leading

imports are bananas, ores, sugar, and chemicals. There is also an extensive local trade in vegetables, fish, and oysters.

The city has broad, regular streets, shaded with live oaks and magnolias and lined with beautiful residences. Important structures are the Mobile County Court House and the Ladd Memorial Stadium. Mobile was founded in 1702 by the French. Later, it was in the possession of the English, the Spanish, and again of the French. It became a part of the United States by the Louisiana Purchase in 1803. Population, 1970, 190,026.

Modesto. A processing, shipping, and marketing center for a rich agricultural region, located 93 miles southeast of San Francisco. Nearby Don Pedro Dam provides the irrigation power that waters the area, which abundantly produces peaches, melons, and other fruits and vegetables. Modesto is a gateway to Yosemite National Park. Population, 1970, 61,712.

Mojave (*mō-hä'vā*) **Desert.** A desert of southeastern California, situated chiefly within the boundaries of San Bernardino county and embracing an area of about 15,000 square miles. It lies south and east of the Tehachapi mountains and north of the Sierra Madre and the San Bernardino mountains. These high ranges intercept the moisture-laden winds from the Pacific, and, in consequence, the Mojave is an exceedingly arid region. The average annual rainfall is only 5 or 6 inches, and the temperature in summer sometimes reaches 120°.

The surface is that of a more or less elevated plateau, broken by numerous small mountains, with intervening valleys and plains. From an elevation of about 4000 feet on the west, this plateau slopes down to 1500 feet elevation or less toward its eastern border. Much of the southwestern portion drains into the Mojave River, which, after flowing in a definite channel for some 50 miles, entirely disappears in valley sands to the eastward.

For the most part, the Mojave Desert presents an aspect of extreme barrenness and desolation. The smaller mountains are mostly jagged masses of naked rock. Many plains are interspersed with saline sinks and dried-up lakes. Some of the valleys are covered with dark-colored sheets of anciently erupted lavas. These volcanic areas also contain numerous cinder cones and small craters.

There are valuable mineral deposits, and, where water for irrigation is available, a few small areas yield good crops. The Santa Fe and the Salt Lake railway cross this desert, as do several well constructed automobile highways. See *Colorado Desert.*

Moline. A city of western Illinois, situated at the junction of the Rock and Mississippi rivers, about 180 miles southwest of Chicago. The city of Rock Island adjoins Moline on the west, and across the Mississippi River from Rock Island is Davenport, Iowa. Moline has one of the largest steel plow plants in the country. Manufacture of agricultural implements is Moline's chief industry. A feature of interest in the vicinity is the United States arsenal on Rock Island. Between this island and Moline is a large roller dam for flood control. Nearby are the Quad-City Airport and the Black Hawk State Park. Population, 1970, 46,237.

Monadnock, Mount. A noted mountain of southwestern New Hampshire, situated about 10 miles southeast of Keene. It is a bold granitic peak with precipitous walls and extremely rugged contour, rising to an elevation of 3186 feet. Because of its isolated position and unusual form, it is one of the most impressive mountains in New England.

Monroe. Originally called Fort Miro, and later renamed for President Monroe, Monroe is situated in northeastern Louisiana, midway between Memphis and New Orleans. It is styled the "Crossroads of Pipelines," being the point where more major pipelines converge than at any other spot in the U.S. Monroe produces chemicals, paper, furniture, and strawberries. It is the seat of Northeastern Louisiana State University. Population, 1970, 56,374.

Monterey (*mŏn'tĕ-rā'*). Second-oldest city in the state, Monterey is a famous tourist attraction situated on the bay side of a peninsula on the California coast, 125 miles south of San Francisco. Fringing the Bay of Monterey is a landscape of great scenic beauty. Among many notable buildings visited by tourists are the old Custom House, built in the Mexican period, the Royal Presidio Chapel, and the home of Robert Louis Stevenson. Nearby are the artist colony of Carmel-by-the-Sea and a grove of ancient cypress trees not known to occur native anywhere else in the world and confined to a small area on Cypress Point. The chief industries are fishing and sardine packing.

Six miles from the city, in 1770, Father Junipero Serra, Spanish missionary to the Indians, established the mission of San Carlos Borromeo. After more than 75 years of Spanish and Mexican occupation, the American flag was run up at Monterey in 1846 and, in 1847, it became the capital of the military government of California. Population, 1970, 26,302.

Montgomery. The capital of Alabama, located on the Alabama River slightly southeast of the center of the state, is the hub of a highly productive grain, fruit, vegetable, cotton, and livestock region, for which it is the central market. A balanced industrial growth has resulted from the combination of favorable climate, excellent water supply, abundant electric power, and an ample labor force. Industries include cotton mills, car shops, foundries, fertilizer plants, machine works, and plywood fabricators.

Montgomery was founded in 1817 and became the state capital in 1846. The Confederate government was organized here in 1861, and this city was the seat of government until the capital was moved to Richmond, Virginia. Historic landmarks are numerous, including spacious antebellum homes and churches and the Confederate White House, occupied by Jefferson Davis, which is now a museum. Montgomery's educational institutions include Huntingdon College and Alabama State University. Population, 1970, 133,386.

Monticello. The residence and estate of Thomas Jefferson, situated in Albemarle County, Virginia, about 3 miles east of Charlottesville. Standing on the summit of a hill (whence the name Monticello, "little mountain"), it commands an extensive view of the surrounding country and has long been regarded as one of the most elegant and picturesque residences in the South. It was constructed from designs made by Jefferson himself, was first occupied in 1770, and remained his home for 56 years. In 1926, it was purchased by patriotic admirers of Jefferson for $500,000 and presented to the nation.

Montpelier (*mŏnt-pēl'yĕr*). The capital of Vermont, located in the north central part of the state. It is the center of an agricultural district and there are many valuable granite quarries in the vicinity. The finest building is the capitol, a granite structure surmounted by a handsome dome. Among its notable institutions are the State Library and the Wood Art Gallery. The town was first settled in 1787, and, in 1805, was selected as the capital of the state. It was made a city in 1895. Population, 1970, 8609.

Moundsville. A city of West Virginia, on the Ohio River 12 miles south of Wheeling. It is in the center of an important agricultural, coal mining, and oil producing district and has varied local industries, including the manufacture of glass. Moundsville is noted for a huge, prehistoric mound, a famous relic of the Mound Builders, after which the city is named. Population, 1970, 13,560.

Mount Clemens. A city and health resort on the Clinton River, about 20 miles northeast of Detroit, Michigan. It has numerous medicinal springs, which attract thousands of persons suffering from chronic ailments, especially rheumatism. Its commercial interests include the growing of roses and the manufacture of tools and dies, metal products, paint, and pottery. Population, 1970, 20,476.

Mount Rubidoux. A bold rocky summit rising abruptly from the Santa Ana valley at Riverside, California. At its crest is a cross dedicated to the memory of Father Junipero Serra, the heroic Franciscan missionary to the Indians. An impressive sunrise service is held on its summit each Easter Sunday.

Mount Tom. A small mountain in Massachusetts which rises precipitously in the Connecticut Valley, opposite Mount Holyoke and about 4 miles south of Northampton. The summit, 1200 feet high, is reached by highway and an incline railroad and affords exceptionally fine views of the surrounding region. A tract of 1700 acres on the mountain has been created a state park.

Mount Vernon. A residential city bordering on the Bronx River and adjoining the northeast section of New York City. Mount Vernon occupies an attractive site, and has wide, well shaded streets and handsome lawns and gardens. While a large portion of the city is restricted to residential purposes, there are several important industrial establishments and a considerable local trade. St. Paul's, the oldest Episcopal Church in America, established in 1665, is located here. Population, 1970, 72,778.

Mount Vernon. The home and burial place of George Washington, situated on the right bank of the Potomac River, in Fairfax county, Virginia, 15 miles south of the National capital. Located on an eminence 200 feet high, the mansion house commands a beautiful view of the river. It is constructed of wood, 2 stories high, 96 feet long, and 30 feet deep, with a high piazza along the front, and is painted white to resemble stone. The main part was built in 1743 by Lawrence Washington, Washington's elder brother, who named it in honor of Admiral Vernon of the British navy. In 1754, soon after the death of his brother Lawrence, the estate came into the hands of George Washington, who added the wings to the house.

In 1858, a tract of 200 acres of the original estate, including the mansion and the brick tomb containing the remains of George and Martha Washington, came into the possession of an association of Southern women which holds it in trust as a shrine of national interest. The six rooms on the ground floor contain many objects of historic value, including the key to the French Bastille, and various pieces of furniture used by the family.

Muncie. A city of eastern Indiana, trading center of an agricultural region, with meat packing and dairying plants. Its manufactures include foundry and machine-shop products, glass, auto parts, and electrical equipment. It is the seat of Ball State University. Population 1970, 69,080.

Muscle Shoals. A series of shallow rapids in the Tennessee River where the stream has a fall of about 134 feet within 37 miles, forming the one interruption to navigation of the river within Alabama.

A canal around the rapids was opened in 1890. In 1918, further development was undertaken by the Federal government for the purpose of improving navigation, generating electric power, and manufacturing a part of the nitrates needed for explosives during World War I. In 1925, Wilson Dam, one of the largest in volume in the world, was completed. Except for sale of current from this dam, the costly property remained idle until 1933. By that time the process for which the nitrate factories had been equipped had become obsolete.

The Tennessee Valley Authority was established in 1933 to take over the properties and to use them in a demonstration of regional planning for the Tennessee River watershed. Other dams were built, making possible a regulated flow the year round, and the nitrate factories were adapted to development of phosphate fertilizers of a superior type. The former home of Helen Keller is in nearby Tuscumbia.

Muskogee (*mŭs-kō'gē*). A city of eastern Oklahoma, situated in the valley of the Arkansas River, about 130 miles east of Oklahoma City. Muskogee is the trade center of a rich agricultural region devoted to the production of cotton, wheat, fruits, and vegetables, and to cattle raising. It has, in addition, large supplies of petroleum and natural gas. Its manufactured products include cottonseed oil, oil well supplies, and refined petroleum. There are several educational institutions. Population, 1970, 37,331.

Nashville. The capital of Tennessee, built on both banks of the Cumberland River, in the north central part of the state. Nashville is situated in a productive agricultural region, near extensive coal fields. These advantages have contributed to make it an important commercial and manufacturing city. It carries on an extensive wholesaling trade. Its leading industries include printing and publishing, meat packing, and the manufacture of glass, aero structures, shoes and boots, food products, clothing, stoves, and furniture. The city is well known for its recording studios (ranking second in the U.S. as a recording center).

Nashville occupies a hilly site, with eminences commanding fine views. On the most lofty hill, stands, like the Acropolis at Athens, the imposing State Capitol. The city has 42 parks and playgrounds covering 5500 acres. They include Centennial Park, where there is an exact replica of the Parthenon in Athens, Greece.

The city is one of the most important educational centers in the South. It is the seat of Vanderbilt University, Belmont College, Peabody College for Teachers, Fisk University, Meharry Medical School, and other public and private institutions.

The first settlement on the site of Nashville was made in 1780, and, in 1806, the city received its municipal charter. From 1812 to 1815 it was the seat of the state legislature. In 1843, it was made the permanent capital of the state. In the park surrounding the State Capitol is the tomb of James K. Polk. The Hermitage, the former home of Andrew Jackson, is about 10 miles east of the city. In 1864, one of the great battles of the Civil War was fought in the environs of Nashville. Population, 1970, 436,044.

Natural Bridge. A bridge of natural rock spanning Cedar Creek 13 miles southeast of Lexington, Va. It is 90 feet long, 50 to 150 feet wide, and about 215 feet above the creek bed. It consists of horizontal limestone strata, which are the remains of the roof of an underground tunnel or a cave through which the creek once flowed. The bridge is crossed by a public road.

Newark (*nū'ĕrk*). A city of New Jersey, situated on the Passaic River and Newark Bay, about 8 miles west of New York City, with which it is connected by several railways, an electric high speed line, and the Holland and Lincoln vehicular tunnels.

The city extends some 3 miles along the west shore of Newark Bay and about 7 miles up the west bank of the Passaic River, from its mouth in Newark Bay to the suburb of Belleville. The site of the city occupies an area of about 24 square miles. For a mile inland from the water front, the surface is fairly level and it then rises gently in a series of plateaus.

Immediately adjoining the city on the north, west, and southwest is a group of smaller municipalities, including Belleville, Bloomfield, East Orange, Orange, West Orange, South Orange, and Irvington. Opposite Newark, on the east bank of the Passaic, are East Newark, Harrison, and Kearny. These and other suburbs are intimately connected with the city and, with it, form a greater Newark whose total population exceeds 1,000,000.

The port of Newark is a deep water harbor 700 feet wide, extending 7000 feet inland. Because of favorable location and fine transportation facilities, including a subway, Newark has become a great manufacturing center, sometimes styled the "Birmingham of America." Its industries are numerous and varied. Among important products are jewelry, electrical machinery, chemicals, paints, varnishes, malt liquors, ships, and meat products. The city is the headquarters of some of the largest life insurance and fire insurance companies.

Newark is a city of fine buildings, wide streets, and spacious parks. Military Park contains Borglum's colossal sculptural group in bronze known as "The Wars of America." Among Newark's most noted buildings are the Public Library, the County Courthouse, City Hall, Federal Building, Newark College of Rutgers University, and the Roman Catholic Sacred Heart Cathedral. Newark was settled in 1666 by Puritans from Connecticut. It was first called Milford but was soon after given its present name. In 1836, it was chartered as a city. Population, 1970, 382,417.

New Bedford. A seaport and manufacturing city of Massachusetts, situated on the Acushnet River, at its mouth in Buzzards Bay, about 55 miles south of Boston. New Bedford was formerly the principal whaling port in the world. This stage of its history is memorialized by the Bourne Whaling Museum and by a rich collection of whaling material in the public library, one of the first free libraries established in the country. After the decline of the whaling industry, it became the leading city in the United States in the manufacture of cotton yarn and cotton cloth. Less important industries include the manufacture of silk goods, fine tools, sperm and whale oil, rayon, shoes, rope cordage, toys, and rubber and paper goods. Educational institutions include Southeastern Massachusetts University and the Swain School of Design. New Bedford was settled in 1652, on land purchased from Massasoit by a company from Plymouth. Population, 1970, 101,777.

New Britain. A manufacturing city of Connecticut, situated in the central part of the state, about 10 miles southwest of Hartford. Because of its extensive production of cutlery, edged tools, and other kinds of hardware, New Britain is sometimes styled the "Hardware City." Other important manufactures include electrical appliances, knit goods, and machine shop products. The city is the seat of Central Connecticut State College and has a unique World War Memorial. New Britain was settled in 1687 but remained a part of Berlin until 1850, when it was incorporated as a town. In 1871, New Britain received its charter as a city. Population, 1970, 83,441.

New Castle. A manufacturing city of western Pennsylvania, built at the junction of the Shenango and the Neshannock rivers, about 50 miles northeast of Pittsburgh. The city's industrial products include chinaware, bronze bearings, strip steel, tin plate, and clothing. New Castle is situated in a fertile agricultural district, rich in coal, limestone, and other mineral deposits. Population, 1970, 38,559.

New Haven. A city of Connecticut, on an inlet of Long Island Sound, some 70 miles northeast of New York City. It occupies a level site partly enclosed by a range of precipitous hills, from 300 to 400 feet high. While a commercial city with extensive shipping interests, the leading industry is manufacturing. In its exceedingly varied industries, there are more than 600 separate manufacturing establishments. Among important manufactures are firearms, clocks, rubber goods, electrical machinery, and an immense variety of iron and steel goods.

The city is well laid out with many imposing public buildings, beautiful parks, and broad, shaded streets. Because of the great number of elms formerly planted in the older sections, New Haven has been called the "City of Elms." It is the seat of Yale University, founded at Saybrook in 1701 and removed to New Haven in 1716. The Harkness Memorial Tower at Yale is one of the finest Gothic towers erected in modern times. The Yale Bowl

seats 70,896 people. The first settlement, made by a company of Puritans in 1638, was known as Quinnipiac, but in 1640 it was renamed New Haven. The city is the burial place of S. F. B. Morse, Eli Whitney, Noah Webster, and other noted men. Population, 1970, 137,707.

NEW ORLEANS (*ôr'lĕ-ănz*). The chief city of Louisiana, the commercial metropolis of the Gulf states, and, after New York City, one of the greatest centers of domestic and foreign trade in the United States. It is situated on the Mississippi River 107 miles above its mouth in the Gulf of Mexico.

The city originally was built along the bend of the river in a semicircular curve and became known as the "Crescent City"; later, its growth up the river followed a backward curve toward Lake Borgne and Lake Pontchartrain, which is spanned by two concrete highway bridges, each about 5 miles in length. Lake Pontchartrain is also spanned by a 24-mile causeway, the world's longest overwater highway bridge.

New Orleans is connected with nearly all the important ports of the world by direct steamship lines, the markets of Asia and western South America being accessible through the Panama Canal. The city forms the gateway to the Mississippi Valley, the greatest agricultural region in the world. It has one of the safest harbors in existence, with a deep water canal from the river through the city to Lake Pontchartrain. More than 100 steamers from 400 to 500 feet in length can be berthed along seven miles of steel docks. Besides public wharves, grain elevators, and coal tipples, the port facilities include also a municipally owned and operated belt line railway.

New Orleans is a leading market for cotton, sugar, molasses, coffee, rice, burlaps, cigars, nitrate, sulphur, timber, and cereals, these products being among its principal exports. It is, moreover, one of the principal manufacturing cities in the South. It makes over three-fourths of the men's wash clothing worn in the United States.

The park system of New Orleans includes the 280-acre Audubon Park, City Park, covering 1500 acres, and a 1400-acre "made" area of boulevards, parks, and bathing beaches on the southeast shore of Lake Pontchartrain. The parks are ornamented with palms, live oaks, magnolias, and a profusion of subtropical shrubs and flowers. The newer residential districts have broad streets, spacious grounds, handsome gardens, and pretentious houses. The old French quarter is a city by itself, with narrow streets lined with rows of quaint old dwellings, built over a hundred years ago in the style of the houses of southern Europe. The Mardi Gras carnival, held yearly, is another heritage of the Latin Old World. New Orleans is often styled the "birthplace of jazz."

Among the buildings of historic interest are the Cabildo, the old archbishop's palace, and the Saint Louis Cathedral, one of the best-known churches in the United States. The principal educational institutions are Tulane and Loyola universities and Newcomb Memorial College for Women.

HISTORY. New Orleans was founded by the French in 1718, and came into the possession of the United States with the Louisiana Purchase of 1803, of which territory it was the capital. It remained the capital of the state of Louisiana until 1849. Population, 1970, 591,502.

Newport. A city and seaside resort of Rhode Island. It has a fine harbor which serves as a naval base for the United States Atlantic fleet. Its palatial private residences, public buildings, parks, fountains, and old-time historic structures render it one of the most attractive cities in the country. In Touro Park is the old Stone Mill, or "Round Tower," mentioned by Longfellow in his "Skeleton in Armor." Other features of interest include a Jewish Synagogue dating from 1763. There are various local industries, including manufactures of furniture and brass goods, and extensive fisheries. Population, 1970, 34,562.

Newport News. A city in Virginia, situated on the north side of Hampton Roads near the mouth of the James River, about 12 miles northwest of Norfolk. Newport News is one of the leading ports of the Southern states and an important coaling station. It has enormous shipbuilding yards, drydocks, and ironworks, and is the center of much agricultural and fishing trade. Points of interest include Fort Monroe, Langley Air Field, one of the greatest in the United States, and the Huntington Mariners Museum. Hampton Roads off Newport News was the scene of the battle between the *Monitor* and the *Merrimac* in 1862. Population, 1970, 138,177.

New Rochelle. A city of southern New York on Long Island Sound 16 miles northeast of Grand Central Station in New York City, of which it is a residential suburb. The city consists characteristically of modern residential districts of beautiful parklike contour. Besides several parks and bathing beaches, the city contains 153 "parklets," or open spaces. New Rochelle is named for the French city of La Rochelle, the home of Huguenots who settled on the site in 1688. Iona College is in New Rochelle. Population, 1970, 75,385.

Newton (*nū'tŭn*). A city of eastern Massachusetts, built on the Charles River, 8 miles west of Boston. Newton is chiefly a residential city but maintains substantial industries. The city is admirably laid out, with fine streets, parks, and drives, and contains many beautiful homes. Among the city's manufacturing establishments are silk mills, printing works, worsted mills, curtain factories, and rubber works. The city is the seat of Boston College, Newton Theological Seminary, and other educational institutions. Newton was settled in 1630 as a part of Cambridge. In 1688, it was made a separate town, called New Cambridge, but, in 1692, it received its present name. In 1873, Newton became a city. Population, 1970, 91,066.

NEW YORK. The chief city of the state of New York, the commercial metropolis of the United States, and the most populous city in the western hemisphere. It is situated on New York Bay at the mouth of the Hudson River, about 205 miles in direct line northeast of the National capital at Washington.

SITE. No metropolis in the world is more strikingly or more beautifully situated than is the city of New York. It is built on three islands, Manhattan, Staten, and Long Island, with a portion on the adjacent mainland, the Bronx.

The Hudson River, here nearly a mile wide, sweeps majestically down the western side of Manhattan and pours its vast waters into the landlocked harbor of New York Bay at the south end of the island. The bay is connected with the ocean by a mile-wide channel running between Long Island on the east and Staten on the west. Between the Bronx and Manhattan is the Harlem River which is connected with the Hudson by Spuyten Duyvil Creek. Separating Manhattan and the Bronx from Long Island is East River, properly an arm of Long Island Sound.

On the west bank of the Hudson, opposite the upper part of the city, the picturesque Palisades tower to a height of from 300 to 400 feet. The surface of the various divisions of the city is fairly level but rises in some parts, as in upper Manhattan, to commanding elevations affording magnificent views of the city and the harbor.

MAIN DIVISIONS. Originally, the city was confined to Manhattan Island. This is 13½ miles long, with a maximum width of 2¼ miles and an area of about 22 square miles. In addition to Manhattan, Greater New York, by consolidation, has since come to embrace Staten Island, called Richmond, with an area of about 60 square miles; the western end of Long Island, known as Brooklyn, 80 square miles; an adjoining part of Long Island, known as Queens, 120 square miles; and the portion of the mainland known as the Bronx, 40 square miles. Each of these divisions includes several small adjacent islands. Officially, New York consists of five boroughs, Manhattan, Brooklyn, Queens, Richmond, and the Bronx, and contains a total area of some 325 square miles.

Manhattan is the heart of New York and contains its great commercial, financial, and mercantile institutions, and also its famous museums, libraries, cathedrals, railway stations, and imposing residences. Brooklyn is a residential district with a large number of industrial establishments. Staten Island is mainly residential, with an increasing number of industries; the Bronx is also chiefly residential, while Queens, containing more than a third of the total area of Greater New York, is the "home" borough. Long Island City, in Queens borough, is its industrial center, while the remainder of the borough is principally a district of suburban homes.

STREETS AND AVENUES. In the older portions of various divisions of the city there are narrow, short, irregular streets. The newer sections, however, have been admirably planned, and contain many magnificent thoroughfares.

At the south end of Manhattan, the streets are cramped and irregular, but, north of Washington Square, they cross at right angles. The great, long north-and-south streets, usually 100 feet wide, running lengthwise of the island, are called avenues. The shorter east-and-west thoroughfares, mostly 60 feet wide, are called streets. Differing from the plan of most American cities, the blocks are solid, having practically no alleys.

An exception to this regular street plan is Broadway, the "greatest street in the world." This noted thoroughfare runs diagonally through the city, in a northwesterly direction, from the Battery, at the sea front, to the extreme northern boundary, a distance of about 16 miles. It traverses the entire length of Manhattan Island and continues through the Bronx into Yonkers, completely changing its character in the different portions of the city through which it passes.

Equally famous with Broadway is Fifth Avenue, the most beautiful thoroughfare in the city, and one of the finest streets in the world. It begins at Washington Arch, about a quarter of a mile west of Broadway, and extends northward for 6 miles, crossing to the east of Broadway at 23d street. It is lined with fashionable shops, beautiful churches, elegant clubs, immense hotels, and palatial residences. Above 59th street, it is restricted to residences by a zoning ordinance.

Other beautiful streets are Morningside Drive, which passes Saint John's Cathedral; and Riverside Drive along the Hudson, passing Grant's Tomb and commanding excellent views of the Palisades. A considerable portion of this drive accommodates two levels of traffic.

Beginning at Trinity Church on Broadway and extending eastward to East River is Wall Street, long the money center of America and, since World War I, the chief financial center of the world. In Brooklyn, Ocean Parkway and Flatbush Avenue are magnificent drives; Northern Boulevard, Queens Boulevard, and Hillside Avenue, in Queens, are noteworthy thoroughfares.

Parks. Lying in the center of Manhattan Island is Central Park, one of the most beautiful pleasure grounds in the world. On its eastern border is the magnificent Metropolitan Museum of Art, and on the west side is the great American Museum of Natural History. This park embraces 840 acres, is largely forested, and contains a reservoir, small lakes, and scores of miles of charming drives, roadways, and footpaths. In it are located the Obelisk, or Cleopatra's Needle, and many fine works of sculpture.

Other important parks are Prospect Park, Brooklyn, with an area of 526 acres, noted for the natural beauty of its wooded hills and broad meadows; Bronx Park, 719 acres, containing superb zoological and botanical gardens; Van Cortlandt Park, embracing 1132 acres and containing immense recreation grounds; Pelham Bay Park, containing 1788 acres, with a shoreline of 9 miles; and Marine Park, covering 1522 acres.

Monuments. In New York are many of the most noted monuments, memorials, and other fine sculptural works of America. The famous Statue of Liberty, designed by Bartholdi and presented to the American people by the French nation, stands on Bedloe's or Liberty Island in New York Bay. Grant's Tomb, a mausoleum of great dignity, overlooks the Hudson from Riverside Park, as does the beautiful Soldiers' and Sailors' Monument from Riverside drive. At the entrance to Prospect Park, Brooklyn, there is an imposing memorial arch, surmounted by a large quadriga by Macmonnies, erected in honor of the soldiers and sailors of the Civil War.

On the Plaza, at the southeast corner of Central Park, stands an impressive equestrian statue of General Sherman by Saint-Gaudens. By the same noted sculptor is the fine statue of Peter Cooper, at Cooper Union, and the noble monument to David Farragut, in Madison Square.

Buildings. New York excels all other cities in the size, height, elegance, and costliness of its buildings. These include immense commercial structures, towering temples of finance, imposing public edifices, monumental railway stations, beautiful cathedrals and churches, magnificent apartment houses, and palatial residences. There is a greater number of large and costly buildings on Manhattan Island than upon any other equal area on the globe. For miles, the buildings contain from 12 to 30 or more stories, rising from 200 to 500 feet in height, with some towering higher than the pyramids or the loftiest cathedrals.

Among the large number of great commercial structures may be mentioned the Metropolitan Building, 50 stories and 700 feet high; the Woolworth Building, 55 stories, more than 792 feet high; R. C. A. Building at Rockefeller Center, the largest office building in the world, 69 stories, 853 feet high; Bank of the Manhattan Building, 70 stories, 927 feet high; Sixty Wall Tower (Cities Service Building), 67 stories, 950 feet high; the Chrysler Building, 77 stories, 1046 feet high; and the Empire State Building, 102 stories, 1248 feet high.

Prominent among public edifices is the Municipal Building 41 stories high, covering two city blocks and surmounted by a tower and statue which rise to a height of 580 feet. Among structures noted for their architecture are the marble Stock Exchange, the New York Clearing House, the Chamber of Commerce, the Hall of Records, the Tiffany building, the United Nations Secretariat Building, and the New York Public Library.

The Grand Central Station and the Pennsylvania Station were each great achievements of architectural and engineering skill. Other notable buildings include the Metropolitan Museum of Art, the American Museum of Natural History, the Columbia University Library, and the Eighth Regiment Armory. A unique architectural unit is Rockefeller Center, or "Radio City," covering three city blocks. Its ten building units, ornamented with hanging gardens and artificial waterfalls, house elaborate broadcasting and theatrical facilities and magnificent stores and offices.

Among hundreds of beautiful churches may be mentioned Saint Patrick's Cathedral built of white marble with spires rising 332 feet. This ranks among the finest Gothic structures in America. Other noteworthy churches are the cathedral of Saint John the Divine, Saint Thomas's Church, Saint Bartholomew's Church, the Temple Emanu-El, the great church of Saint Paul the Apostle, and the Riverside Church, containing one of the finest carillons of bells in the western hemisphere.

Intercommunication. East River is spanned by 6 bridges, ranking among the largest in the world. Four of these—Brooklyn Bridge, Manhattan Bridge, Williamsburgh Bridge (connecting New York and Brooklyn), and the Triborough Bridge, joining Queens with the Bronx—are suspension bridges. The Queensboro Bridge, connecting New York and Queens, is a cantilever structure. Hell Gate Bridge, an immense steel arch, connects the Bronx with Queens. Staten Island is connected with New Jersey by three bridges, Kill van Kull at Bayonne, Goethals at Elizabeth, and Outerbridge Crossing at Perth Amboy. Washington Memorial Bridge crosses the Hudson and connects 178th Street with the New Jersey shore. The Verrazano-Narrows Bridge stretches across the entrance to New York's harbor from Staten Island to Brooklyn. The world's longest single-span bridge, it was opened in 1964.

An extensive ferry service and two pairs of subway tunnels for electric cars connect Manhattan with Brooklyn, as does also the Brooklyn-Battery vehicular tunnel, and two pairs also connect Manhattan with Queens. The Holland and Lincoln vehicular tunnels, under the Hudson River, connect New York City with Jersey City, and a 3½-mile viaduct connects it with Elizabeth, New Jersey.

Most of New York's local transportation system is municipally owned. The city operates 250 route miles of rapid transit subway lines and 80 miles of bus routes. Running north and south in the narrow island of Manhattan, there are two 4-track subway lines, both of which continue under the East River to Brooklyn where they connect with steam and electric rapid transit to all parts of Long Island. The Long Island railroad transports more commuting passengers than any other railroad in the world.

Educational Institutions. New York is the seat of two great universities, Columbia University, on Cathedral Heights, and New York University in the Bronx, overlooking the Harlem River. With the former is affiliated Barnard College, the Teachers' College, and the Horace Mann School. Connected with New York University is the Hall of Fame for noted Americans.

Among many other prominent educational institutions are the College of the City of New York, Hunter College, Manhattan College, Brooklyn College, Fordham University, the College of Saint Francis Xavier, Cooper Union, the College of Physicians and Surgeons, and the Rockefeller Institute for Medical Research. Of great influence in the educational life of the city are the Public Library, with more than 40 branches, the Metropolitan Museum of Art, the Guggenheim Museum, the American Museum of Natural History, the Planetarium and the Brooklyn Institute of Arts and Sciences. The Medical Center on Washington Heights, overlooking the Hudson River, takes the first place among institutions of the kind throughout the world.

Transportation. New York Bay, nearly enclosed by islands, forms one of the finest harbors in the world. The city of New York, built around it, has a total water front of some 771 miles, of which more than 345 miles are developed with port facilities. About 100 ocean steamship lines, affording service to all parts of the world, have headquarters in New York. Some 40 lines of river and coastwise steamers likewise operate from the port. New York has water connections to the Great Lakes through the Hudson River and the State Barge Canal. The great railway systems of the New England and the Middle Atlantic states, and also various western railroads, have terminals, either within the city or across the Hudson on the New Jersey shore. The Pennsylvania Railway is connected with New York City by tunnels under the Hudson River.

Commerce. New York's commercial supremacy is owing to its magnificent harbor facilities and to its geographical location. The largest ships are accommodated at its wharves, and railway and inland water routes afford quick collection and distribution of goods throughout the richest and most populous region in America. The commerce of New York is several times greater than that of any other port in the New World, and, in value, usually embraces about one-half the total imports and exports of the United States. The volume of the coastwise trade usually greatly exceeds that of the foreign trade. The wholesale and jobbing trade is enormous, as is also the distribution of the city's immense manufactures. In 1936, a zone in Staten Island was made a free port.

Finance. During the present century, New York has become the dominant money center of the world, with annual banking transactions aggregating more than $300 billion. Here are located the greatest financial institutions of the country, including powerful banks, trust companies, and insurance companies, the New York clearing house, the stock exchange, the cotton exchange, and casualty, credit, fidelity, and surety companies.

Manufactures. In value, the manufactures of the metropolis exceed those of any other manufacturing center in America. Usually about one-tenth of the total manufac-

tures of the United States is produced in New York City. This supremacy is owing to an immense volume of light manufacturing, for the most part carried on in small factories. The industries are exceedingly diversified, including some 30,000 establishments and representing about 90 per cent of all the industries listed in the country. The largest single product is clothing; more than half of the clothing worn in the United States is made in the city. The second largest industry is the printing and publishing of newspapers, magazines, periodicals, and books. Other important industries are meat packing, sugar refining, petroleum refining, and the manufacture of millinery, lace, fur goods, jewelry, tobacco, drugs, shoes, and machinery.

History. In 1609, Henry Hudson, employed by the Dutch, sailed up the river which bears his name. Dutch fur traders began operations along the Hudson in 1613 and soon after built a fort, near which the first white settlement developed. The first permanent colonists, mostly Walloons, arrived in 1624. Peter Minuit, in 1626, bought Manhattan Island from its Indian owners for $24, and named the settlement New Amsterdam. There were difficulties with the Indians, but, under the rule of Peter Stuyvesant, 1647-64, the settlement grew to a village of 1000 inhabitants.

In 1664, New Amsterdam was captured by the English, who renamed it New York. Despite political conflicts, the town in 1700 had increased to 5000 inhabitants, about half Dutch and half English. During the Revolutionary War, British armies occupied the town for 7 years, 1776–83. In this unfortunate period, New York lost about half its inhabitants and was largely destroyed by fire. Within 8 years, however, the population trebled, commerce revived, and for a year and a half, 1789–90, New York was the capital of the Federal government. Washington, the first president of the United States, was inaugurated, April 30, 1789, in Federal Hall on Wall Street.

The completion of the Erie Canal in 1825, furnishing a waterway from the Hudson to the Great Lakes, made New York the gateway for the commerce of the rapidly developing nation. This so accelerated the city's growth that, in 1835, New York numbered 200,000 inhabitants. The first railway to the Great Lakes was completed in 1851, and thenceforward the history of New York is a record of continuous and monumental growth.

More recent achievements were the consolidation of the five boroughs into Greater New York, the construction of the subway system with tunnels under East River and the Hudson, and the completion of the gigantic Catskill aqueduct, insuring an adequate water supply to the expanding metropolis. Population, 1970, 7,867,760.

Niagara Falls. The grandest cataract in America and the second largest in the world, being exceeded in combined height and volume only by Victoria Falls in South Africa. It is situated about 22 miles north of Buffalo, New York. The Niagara River in its northerly course of over 26 miles descends 326 feet from the level of Lake Erie to that of Lake Ontario. By far the greater part of this descent occurs at the falls and at the rapids immediately above and below them. For the first 2 miles after leaving Lake Erie the river is troubled and rapid. It then expands into a broad, placid stream, from 1 to 2 miles wide, and encircles several islands.

After flowing nearly 20 miles and descending only about 20 feet, the river suddenly narrows and enters a series of beautiful rapids. In about a half mile the river descends 52 feet, in seething, boiling torrents and eddies in which the whole surface is torn and tossed into white spray. The waters then reach the edge of an abrupt declivity, the Niagara escarpment, and make a sudden plunge to the bottom of an immense gorge. A short distance above the brink of the falls, Goat Island separates the river into two unequal streams. The narrow, shallower one, on the American side, discharges over the American Fall, 167 feet in height and 1060 feet wide. The main part of the river swings to the west of Goat Island and discharges over the Canadian or Horseshoe Fall, 158 feet high, with a deep retreating curve in the center and measuring about 2500 feet along the crest. A feature of interest is the illumination of the cataract each evening by shifting lights of rich and varied color.

The water flowing over the American Fall is from 1 to 4 feet deep, but that plunging over the Horseshoe Fall is estimated at about 20 feet in depth. The main cataract carries over fully 90 per cent of the water, while the American Fall discharges less than 10 per cent. The volume of flow is normally about 500,000 tons of water a minute.

The edge of the American Fall is receding at a rate estimated at from 2 to 7 inches a year. In 1954 hundreds of tons of rock, loosened by the seepage of river water, fell into the gorge from the point of land adjoining the falls. Measurements by the U.S. Geological Survey indicate that the Horseshoe Falls has been receding at the rate of about 5 feet a year for nearly a century. In 1969 the water flowing over the American Fall was temporarily diverted with a cofferdam so that the recession could be studied with the intention of "repairing" the fall to prevent its rapid erosion.

For about 7 miles below the foot of the falls, the river descends between nearly perpendicular cliffs, 200 to 300 feet high, through a series of magnificent rapids, the famous Niagara Gorge. In width, the gorge varies from 1700 feet, opposite the American Falls, to 700 feet, opposite the Whirlpool. The river at the bottom of the gorge is considerably narrower, with depths believed to range from 100 to 500 feet, and with a speed in some places estimated at 30 miles an hour.

About 3 miles below the falls the river rushes into the Whirlpool. This is a huge circular indentation worn into the Canadian side of the river and surrounded by walls 300 feet high. The river plunges into this great excavation in a northwesterly direction and is forced to leave it in a northeasterly direction, forming one of the most impressive maelstroms in the world. At the end of the gorge, near Lewiston, the river again widens and flows tranquilly for about 7 miles to its mouth in Lake Ontario.

Niagara Falls is the most accessible to the traveler of any of the great cataracts. Fine parks, with many conveniences for the public, have been established on both sides of the river. There is a bridge to Goat Island. An aerial cable tramway spans the chasm over the Whirlpool, giving a unique view of this natural wonder.

While several early French missionaries, visiting the Niagara region, wrote accounts of the falls received from the Indians, the first white man to describe and depict the great cataract was Father Hennepin, who accompanied La Salle to the Niagara frontier in 1678. French domination of the region continued until 1759, when Fort Niagara was surrendered to the British. The region was controlled by the British until 1796 and was the scene of many conflicts during the War of 1812.

Niagara Falls. A manufacturing city of western New York, situated on the Niagara River at the falls from which it takes its name. By utilizing immense power generated at the cataract, the city has developed extensive manufactories and has become an important center of electrochemical industry. Among the leading manufactures are chemicals, electrical machinery, aluminum ware, carborundum, paper and wood pulp, flour, shredded wheat biscuit, roofing materials, and metallurgical products.

The hydroelectric power is developed by the Power Authority of the State of New York as an agent under the St. Lawrence Waterway Treaty of 1950 with Canada. In order to take maximum advantage of the fall, two intakes were constructed 2½ miles above the falls to convey the water about four miles to one of the world's largest power plants, where nearly 2 million kilowatts of power is developed. Only half of the diversionary flow is taken during the day in the tourist season so as to interfere as little as possible with the scenic attraction of the falls. When demand for current is low, the surplus current is used to pump water into an 1800-acre reservoir above the power plant, and this water in turn, in falling back, develops additional current at times of peak demand.

Because of the falls, which rank among the world's greatest scenic wonders, the city is visited yearly by tens of thousands of travelers. Niagara Falls and Suspension Bridge, formerly two villages, were, in 1892, united as the city of Niagara Falls. Population, 1970, 85,615.

Nogales (*nō-gä'lĕs*). A city on the southern boundary of Arizona, 65 miles south of Tucson. A fence, with gates always open, separates it from the Mexican city of the same name. Nogales is the trade center of a mining and grazing district and is an inland gateway to the western coast of Mexico. A feature of historical interest in the vicinity is the ruin of the Tumacacori Mission. This was founded in 1691 by Father Kino, a Jesuit missionary, was taken charge of by Franciscan fathers in 1769, and is now a national monument. Population, 1970, 8946.

Norfolk. A city and the principal seaport of Virginia, with about 50 miles of waterfront on the Elizabeth River, Hampton Roads, and Chesapeake Bay.

Norfolk, together with Portsmouth, forms the largest naval station in the Union. It is the base for the Atlantic fleet. The harbor is capable of giving anchorage to the largest class of vessels.

A little to the east of the city is a terminus of the Chesapeake Bay bridge-tunnel, completed in 1964 at a cost of $200 million. It provides a 17.6 mile roadway crossing to Cape Charles, the roadway descending from the bridge into tunnels at two points so as to permit passage of ships at these points.

The port carries an extensive shipping trade in cotton, tobacco, lumber, corn, cattle, horses, fish, oysters, fruits, vegetables, and peanuts. The principal manufactures include ships, airplane parts, fertilizers, agricultural implements, lumber, cotton goods, flour, and roasted peanuts.

Among the public buildings may be noted the Custom house, the City Hall, and the Cotton Exchange. The educational establishments include old Dominion University and

Virginia Wesleyan College. Popular seaside resorts nearby include Virginia and Ocean View beaches. Norfolk was first settled in 1682, incorporated as a borough in 1736, and chartered as a city in 1835. Population, 1970, 307,951.

Norwalk. A city of Connecticut, 14 miles southwest of Bridgeport, on Long Island Sound. An industrial center since before the Revolutionary War, Norwalk now manufactures hats, pumps, leather goods, electronic equipment and other items. Norwalk is also a research center and a summer resort. The area is rich in colonial history. Population, 1970, 79,113.

Oakland. The fifth largest city of California, situated on the mainland shore of San Francisco Bay and connected with San Francisco by the 8¼-mile San Francisco-Oakland Bay Bridge. Oakland's metropolitan area extends for 23 miles along the San Francisco Bay eastward to the San Joaquin Valley, consisting of an almost unbroken chain of factories, waterfront industries, commercial trading centers, and residences. Mild year-round temperatures are an outstanding feature of the area.

Oakland is the terminus for three major railroads. Inland waterways and ocean-freight service is provided by the Port of Oakland. The freeway system has also helped to make Oakland a distribution center. Manufactures include processed foods, passenger cars and trucks, office equipment, tin and glass containers, metal products, floor coverings, chemicals, and paints.

Oakland has 65 parks covering 1600 acres. Lake Merritt, a 155-acre body of salt water, is located in the center of the city, surrounded by Lakeside Park. A recent addition to the city is the new $9 million Oakland Museum, featuring a design developed by a competition of the world's leading architects. Among Oakland's educational institutions are Mills College for women, the College of the Holy Names, and the California College of Arts and Crafts. Oakland was founded on a Spanish grant in 1850, was incorporated as a town in 1852, and as a city in 1854. Population, 1970, 361,561.

Oak Park. A village of northeastern Illinois, about nine miles west of the center of Chicago, of which it is a residential suburb. Oak Park was incorporated in 1901. Population, 1970, 62,511.

Oak Ridge. A community in eastern Tennessee, one of the three so-called "atomic cities," which mushroomed during World War II, when it became a center for the development of materials for the atomic bomb. At that time it had an estimated population of 75,000. Oak Ridge sprang from practically nothing, as did also the other two places, Richland, Washington, and Los Alamos, New Mexico. Population, 1970, 28,319.

Oberlin. A town of northeastern Ohio, situated about 35 miles southwest of Cleveland. While it conducts a substantial trade with the surrounding agricultural districts and has local industries, it is chiefly noted as the seat of Oberlin College, the first American college to adopt coeducation. The town is well laid out, with broad, shady streets and fine residences. Population, 1970, 8761.

Ogden. The second largest city of Utah, situated at the junction of the Ogden and Weber rivers, at the foot of the Wasatch Mountains, about 35 miles north of Salt Lake City. It is noted for its picturesque scenery. A boulevard passes through the scenic Ogden Canyon a distance of 8 miles to Ogden Valley and Pine View Dam, which afford various recreational opportunities. Ogden is the distributing center of a productive agricultural, fruit growing, and stock raising district. Electricity for light, heat, and industrial purposes is supplied to the city by the waterfalls from surrounding canyons. Meat packing, fruit and vegetable canning, oil refining, and the manufacture of beet sugar and flour are among the chief industries. Ogden was founded in 1848 and in 1850, under the direction of Brigham Young, was laid out as a city. Population, 1970 69,478.

Oklahoma City. The capital of Oklahoma, situated on the north branch of the Canadian River in the central part of the state. Lying in the midst of a rich oil producing, agricultural, and stock raising country, the city has grown into a community of diverse industry, aviation, manufacturing, distribution, petroleum, utilities, transportation, science and medicine, wholesale and retail trade, finance and various commercial enterprises, and business services. The city's 83 parks and playgrounds cover 9924 acres. An architecturally outstanding addition to the capitol, in Ionic style, and to many large business buildings, is the National Cowboy Hall of Fame and Museum. Oklahoma City was granted its charter in 1891 and was made capital of the state in 1910. Population, 1970, 356,661.

Old Point Comfort. A favorite watering place in Virginia, situated on a neck of land where Hampton Roads at the mouth of the James River joins Chesapeake Bay. Fort Monroe is situated here.

Olympia. The capital of the state of Washington, situated on the southernmost inlet of Puget Sound. The city is the port for a district rich in lumber and in agricultural products. Industries include boat building, the manufacture of plywood, the brewing of beer, and the oyster industry. Manufacturing interests are promoted by the abundant hydroelectric power available, the chief industry being the production of lumber. The noteworthy buildings include the Capitol, the Federal Building, and four other governmental buildings costing in all $15 million. The first settlement was made at Olympia in 1845. The town was laid out in 1851, and became the territorial capital in 1853. Population, 1970, 23,111.

Omaha. The chief city of Nebraska, situated on a commanding site on the west bank of the Missouri River, opposite Council Bluffs, Iowa.

Omaha owes its position as the commercial and manufacturing metropolis of the state to the fact that it is one of the greatest gateways of the West, having the facilities afforded by several great railroad systems and the deepened channel of the Missouri River. The industries of the city, especially those based on agricultural products, are enormous. Its live stock market is the second in the world, while its creameries and macaroni factories are among the largest in the country. It is one of the greatest meat packing centers in the United States. Other industries and manufactures include ore smelting and refining, railway car repairing, flour, steam engines, machinery, and dairy equipment. It is also an insurance center.

Omaha has 3646 acres of parks and many fine public buildings. Among the city's numerous educational institutions may be mentioned the University of Nebraska at Omaha, Creighton University, and the Joslyn Memorial Art Museum. From 1854, the date of the first permanent settlement, to 1867, Omaha was the capital of Nebraska. Population, 1970, 347,328.

Oraibi (*ō-rī'bĭ*). A village of the Hopi Indians in northeastern Arizona, believed to be the oldest continuously inhabited community in the United States. It lies about 100 miles north of Winslow. The community existed as early as 1370, this fact being inferred from a study of the annual growth rings of timbers in the ruins. Population about 100.

Orlando. A city and winter resort of Florida, situated amidst numerous small lakes, some 2000 in all, about 40 miles inland from the approximate center of the state's Atlantic coastline. There are 33 lakes within the corporate limits. Palms, magnolias, and laurels impart a subtropical beauty which joins with the mild climate in attracting winter visitors.

Orlando lies in the center of a rich citrus fruit country, which also produces truck crops and raises cattle. Its primary industries are processing citrus fruits and the manufacture of electronic and defense equipment. Educational institutions include Rollins College and Florida Technological University. Population, 1970, 99,006.

Oshkosh. A city of eastern Wisconsin, situated on the western shore of Lake Winnebago at Fox River, about 75 miles north of Milwaukee. It is located in a once densely wooded region, and the woodworking industry is still a leading commercial interest of the city. Other industries include the manufacture of furniture, travel goods, overalls, and trucks, Oshkosh is a well-known pleasure resort. Lake Winnebago is noted for its game fishing; yachting in the summer and ice boating in the winter are favorite sports. Population, 1970, 53,221.

Pago Pago (*pang'ō-pang'ō*). A fine natural harbor on the south coast of Tutuila, principal island of the American Samoa group. On the shores of this bay are the village of Pago Pago, government offices in the villages of Fagatogo (the constitutional seat of government), business districts, and key industries. Chief exports are copra and canned tuna. Population 1970, 3800 in the bay area—more than 29,000 for all of American Samoa.

Painted Desert. An area of plateaus and low mesas in north central Arizona. It extends from the top of the Marble Canyon of the Colorado River southeastward along the east side of the valley of the Little Colorado for about 100 miles, varying in width from 15 to 40 miles. At the south, it ends near the Santa Fe railway, which crosses it between Holbrook and Winslow. This desert lies at an altitude of about 5000 feet and has an exceedingly arid climate. In consequence, vegetation is so scant that vast areas of rocks are bare or very nearly so. These rocks, mostly Triassic shales and sandstones, exhibit a great variety of colors, whence the name "painted."

Situated on the margin of this desert, about 60 miles north of Winslow, are the seven villages of the Hopi Indians, the best known of which are Walpi and Oraibi. See *Walpi*.

Palisades, The. The name given to a series of massive cliffs on the west bank of the Hudson River. From near Haverstraw, New York, these extend south to Weehawken, New Jersey, a distance of about 30 miles. For the most part, these precipitous cliffs rise almost directly from the water's edge, varying in height from 200 to 550 feet. They

consist of basaltic trap rock or diabase, which exhibits marked columnar effects, forming a striking feature in the beautiful scenery of the lower Hudson. The Palisades Interstate Park in New York and New Jersey embraces some of the finest portions of the Palisades.

Palm Beach. A noted winter resort on the southeast coast of Florida, about 64 miles north of Miami. It is situated on Lake Worth, opposite West Palm Beach, the nearest railway town. Its delightful climate, together with its bathing, boating, and fishing facilities, makes Palm Beach one of the most desirable of pleasure haunts. Palatial hotels, spacious parks, and golf links attract thousands of visitors. Population, 1970, 9086.

Palm Canyon. A narrow, rocky gorge opening upon the extreme western end of the Colorado Desert, at the southeastern base of San Jacinto Mountain, about 7 miles south of Palm Springs, California. Near the mouth of this canyon, growing along the small watercourse at its bottom, is one of the largest existing groves of the stately Washington palm, many trees being from 40 to 60 feet high. Their brilliant green foliage makes a striking contrast with the arid, barren rocks forming the canyon walls.

Palo Alto (*păl'ō ăl'tō*). A city 32 miles south of San Francisco, California. Favored by location and climate as a residential site, it is noted as a center of education and research. Large areas of the city are occupied by Stanford University, with its Hoover library of history, its medical center, its art gallery, and its research laboratories, particularly in electronics and biophysics. Some local industries are related to the research in high-energy physics. Population, 1970, 55,768.

Parkersburg. A city of West Virginia, located on the Ohio River, at the mouth of the Little Kanawha, in a region rich in oil, coal, natural gas, and fire-clay. Its manufactures include glass, petroleum products, chemicals, viscose, rayon, lumber, steel products, earthenware, and electrical porcelain. Besides having river and rail transportation, it is an important highway center, being situated at the junction of U.S. routes 50 and 21. Parkersburg was founded in 1789. Population, 1970, 44,208.

Pasadena. A residential city and widely known winter resort of southern California, northeast of Los Angeles and touching its boundaries at several points. It occupies a beautiful site in the foothills of the Sierra Madre, in a region luxuriant with palms, orange groves, eucalyptus, and other subtropical vegetation. The city is noted for its spacious avenues, fine public buildings, and handsome residences, and is the seat of many educational institutions, including the California Institute of Technology.

Among the many features of interest within or near the city are the Huntington Library and Art Gallery, the Rose Bowl, Mount Wilson Observatory, a beautiful public library with outdoor reading rooms, Mount Lowe, San Gabriel Mission, and a mile-long avenue of deodars known as "Christmas Tree Lane." Its 13 parks cover 500 acres, the largest, Brookside, being within a great natural gorge, the Arroyo Seco, which is spanned at Colorado Street by one of the country's most beautiful bridges. The city is widely known for its annual festival, called the "Tournament of Roses," celebrated on New Year's Day. In 1874, a colony from Indianapolis, Ind. settled on the site of Pasadena and began raising fruit; in 1886, Pasadena received its charter as a city. Population, 1970, 113,327.

Pasadena. A large residential suburb of Houston, Texas, Pasadena was the site of the capture of the Mexican General Santa Anna after the Battle of San Jacinto. Population, 1970, 89,277.

Passaic (*pă-sā'ĭk*). A manufacturing city of New Jersey, situated on the Passaic River, about 12 miles northwest of New York City. The chief industry is the manufacture of woolen and worsted goods. Passaic is said to make one-third of the handkerchiefs produced in the United States. Other important industrial establishments include cigar factories, rubber, metal, and dye works. Population, 1970, 55,124.

Paterson. A city of New Jersey, located on the Passaic River, about 16 miles northwest of New York City. Immense power, developed from Passaic Falls, 50 feet in height, is utilized in the city's numerous industries. Paterson is the leading producer of silk fabrics in the United States. It has also cotton and woolen mills, dyeing and finishing establishments, airplane engine factories, and machine shops.

Paterson owes the beginnings of its great industrial growth to the "Society for Establishing Useful Manufactures," promoted largely through the efforts of Alexander Hamilton, in 1791, when he was secretary of the treasury. In 1792, the site, "by the Great Falls of the Passaic," was chosen for the location of the mills which were to be used in bringing about the commercial independence of the United States from Europe. Population, 1970, 144,824.

Pawtucket. A city of Rhode Island, built on both banks of the Pawtucket River, about 4 miles northeast of Providence. The city was the birthplace of the cotton goods industry of the United States. The original mill, founded by Samuel Slater in 1790, is now a museum. Pawtucket produces wire and cable, textiles, toys, and electronic components. Its fine parks, public squares, and imposing bridges across the river serve to make Pawtucket an attractive city. Population, 1970, 76,984.

Pendleton. A city of northeastern Oregon, on the Umatilla River, 225 miles east of Portland. Pendleton is the supply center for the Umatilla irrigation district and has an extensive trade in grain, fruit, and live stock. Pendleton has become widely known through its annual exhibition festival "The Round-Up." Population, 1970, 13,197.

Pensacola. A seaport of Florida, situated on Pensacola Bay, 10 miles north of the Gulf of Mexico. It has a fine landlocked harbor and conducts an extensive domestic trade. Industrial products include paper, fertilizers, wood products, cottonseed oil, and naval stores. A huge navy aviation school is located there. The city was settled by Spaniards in 1559. Points of interest include forts Barrancas, San Carlos, and Pickens, and numerous recreational facilities. Population, 1970, 59,507.

Peoria (*pē-ō'rĭ-ȧ*). A manufacturing city of Illinois, built on the west bank of the Illinois River, 160 miles southwest of Chicago. Peoria is the commercial center of a rich agricultural district, in close proximity to large coal fields. The manufactures include agricultural implements, packed meats, paper goods, stoves, barrels, woven wire fence, cordage, stock foods, and chemicals. Peoria has one of the largest truck-in stockyards in the country. Parks cover about 6810 acres. Lake Peoria and other natural features of the city's environment provide beautiful scenery within and around it. The city is the seat of Bradley University. Population, 1970, 126,963.

Pepin (*pē'pĭn*), **Lake.** An expansion of the upper Mississippi River, situated in a fine scenic region, about 30 miles south of Saint Paul, Minnesota. The lake is about 30 miles long and from 1 to 2 miles wide. It is surrounded by imposing bluffs of limestone, rising about 400 feet above the water and carved by erosion into many remarkable shapes. The town of Red Wing with a population, 1970, of 10,441 is situated at its northern end.

Perth Amboy. A city of eastern New Jersey, located on Raritan Bay, about 20 miles southwest of New York City. Perth Amboy, by reason of its good harbor, has extensive shipping interests, and is an important commercial and industrial center. Among the chief industries are chemical works, copper and silver refineries, and the manufacture of clothing and hats. The city is connected with South Amboy by the Victory Bridge, and with Staten Island by a bridge completed in 1928 at a cost of $16 million. Perth Amboy was settled in 1683, and, for a long period, was the capital of New Jersey province. It became a city in 1718. Population, 1970, 38,793.

Petersburg. A city of southeastern Virginia, situated on the south bank of the Appomattox River, 23 miles south of Richmond. Its chief industries consist of the manufacture of tobacco products, trunks, optical lenses, and cotton clothing. The city is located in an extensive tobacco growing region at the northern end of the peanut belt, and carries on a substantial trade in these products. Historic reminders of the Civil War are found in the Battlefield National Park and the Lee Memorial Park. Population, 1970, 36,103.

Petrified Forests. See *Adamana.*

PHILADELPHIA. The chief city of Pennsylvania, and the fourth most populous in the United States. It is situated at the junction of the Schuylkill and the Delaware River, some 50 miles from the mouth of the Delaware in Delaware Bay and 85 miles by water from the Atlantic Ocean.

SITE. From the confluence of the rivers, Philadelphia extends northerly along the Schuylkill for more than 20 miles and northeasterly along the Delaware for nearly the same distance, and has an irregular northern boundary. The site embraces a total area of about 130 square miles. At the south, between the two rivers, the surface is level. The old city was laid out on this peninsula. This section is now the principal business center.

To the north, the surface rises, culminating in Chestnut hill, 430 feet high, and other similar eminences. The manufacturing districts were developed in this northern area, with Germantown, now within the city limits, occupying the heights above them. That section west of the Schuylkill river is called West Philadelphia and is largely residential.

STREETS. Philadelphia was the first modern city to be

laid out, with broad, long, straight streets, intersecting at right angles, and with small parks and squares located at suitable intervals.

Broad Street, one of the greatest streets of America, bisects the city from north to south. The Benjamin Franklin Parkway extends northwest from the City Hall at Broad and Market streets. Fountains, shade trees, and flower beds make this drive one of the most beautiful in the world.

Parks and Monuments. The city park system, including 140 parks, squares, and parkways, embraces an area of about 8000 acres. The finest unit is Fairmount Park, the largest municipal park in the nation, containing some 3600 acres along the Schuylkill River, and connected with the City Hall by the magnificent Benjamin Franklin Parkway. Wissahickon Drive, 6 miles in length, along Wissahickon Creek in Fairmount Park is regarded as one of the finest scenic drives within the limits of an American city. Among other important parks are League Island, 300 acres; Pennypack, 726 acres; Tacony, 250 acres; Cobb's Creek, 288 acres; Hunting, 86 acres; Burkolme, 69 acres; Whitehall Commons, 35 acres; Bartram's Garden, 27 acres; and the Cope Arboretum, 22 acres. Roosevelt Boulevard, 300 feet wide, is a part of the Lincoln Highway.

Important monuments are the Soldiers', and Sailors' Memorial in Fairmount Park, the imposing Washington Monument at the main entrance to the park, and the World War Memorial on the Parkway. Noted statues within the commercial district are: of Washington, in front of Independence Hall; of Franklin, at the Post Office; and of Girard, Muhlenberg, Leidy, and McClellan, on the city hall plaza. On the plaza stands also Saint-Gaudens's statue of "The Pilgrim." Other noteworthy sculptural works in various parts of the city are Wolff's "Wounded Lioness," Remington's "Cowboy," and statues of Lincoln, Grant, Meade, Garfield, Columbus, Goethe, Schiller, Humboldt, and Joan of Arc.

Buildings. The monumental City Hall, an immense marble structure, is about 470 feet square, and covers 4½ acres. The tower, some 548 feet high, is surmounted by a colossal statue of William Penn.

Among the older buildings, Christ Church and Independence Hall exemplify the Colonial style of architecture, the buildings of Girard College illustrate the Neo-Greek style, and Saint Mark's Church is an example of the Gothic.

United States government buildings include the Federal Building; the United States Mint, one of the greatest in the world; the Post Office; and the Customhouse. Other noteworthy structures include the Reading depot, the immense Pennsylvania railroad station, costing over $100 million, the $16 million Museum of Art on an eminence at the end of the Parkway, and Convention Hall. Among numerous fine commercial buildings may be mentioned the Philadelphia Savings Fund, new Penn Center Plaza buildings, the Girard Trust, the Curtis, the Bell Telephone, the Arcade, the Atlantic, the Morris, and the 35-story Lewis tower, and the Wanamaker, the Gimbel Brothers, the Strawbridge and Clothier, and the Lit Brothers stores. A stadium seating 100,000 people, is a legacy of the Sesquicentennial Exposition, held in 1926 in south Philadelphia.

Historic Structures. No city in the United States, except Boston, has preserved a larger number of important buildings associated with the early history of the nation. Chief among these is Independence Hall, built 1729–34, America's most famous landmark. In this notable building, the second and the third Continental Congress met; here Washington was chosen commander in chief; in it the Declaration of Independence was signed; and from its tower the Liberty bell, still preserved in the building, pealed forth its message of freedom.

To the west of Independence Hall is Congress Hall, where the United States Congress met from 1790 to 1800, and where George Washington, in 1793, and John Adams, in 1797, were inaugurated. East of Independence Hall is the old City Hall, first occupied in 1791, now used as a historical museum. The three buildings—Independence Hall, Congress Hall, and the old City Hall—form what is known as the State House group in Independence Square. A mall around the group is a national monument.

In the same vicinity is Carpenters Hall, where, in 1774, the first Continental Congress met, and where, in 1787, the Constitutional convention framed the Constitution of the United States. On Arch Street stands the home of Betsy Ross, who is said to have made the first American flag.

Among historic churches are Old Swedes' Church, built 1698–1700; Christ Church, begun in 1727; Old Saint Joseph's Church, dating from 1729; and Saint Mary's Church, built in 1762.

The Penn Mansion, built in 1682, was the first brick house erected in Philadelphia. It originally stood between Market and Chestnut streets, in the heart of the city. With the encroachment of great business structures, it was taken down and carefully re-erected in Fairmount Park.

Educational Institutions. Philadelphia is the seat of Temple University, the University of Pennsylvania, and Drexel Institute. It is also a noted center of medical and dental education. Among its prominent medical schools are the Jefferson, the Hahnemann, the Woman's Medical College, and the medical departments of Temple and Pennsylvania universities, which also have important dental schools. Other noteworthy institutions are the planetarium, the schools of the Pennsylvania Academy of Fine Arts, the Franklin Institute, the Curtis Institute of Music, the Spring Garden Institute, the Public Library, Rodin Musuem, the Franklin Memorial Museum of Graphic Arts, Girard College, La Salle College, Saint Joseph's College, and the William Penn Charter School, founded in 1701. In the suburbs are Bryn Mawr, Haverford, Villanova and Swarthmore colleges, Ogontz School, and Overbrook Seminary.

Transportation. Although ships from its wharves sail nearly 85 miles before entering the ocean, Philadelphia is an important seaport. It is the largest fresh water port in the world and America's second busiest. It has more than 35 miles of water front on the Delaware River, which admits the passage of ocean-going ships. The Schuylkill is also navigable.

Philadelphia is also a great railroad center, with a huge network of lines extending, not only into the nearby coal and iron districts, but also into the Ohio and the Mississippi valley and into the South. The city is served chiefly by the Pennsylvania, the Reading, and the Baltimore and Ohio systems, and has the most direct connections with the Middle West of any great Atlantic port. Two municipal airports, including International Airport, rank Philadelphia as a leading aviation center for foreign and domestic flights. Eleven major airlines, including a number of jet lines, provide the city with nearly 400 flights daily.

Local transportation consists of an immense system of surface electric railways, supplemented by both subway and elevated high-speed lines, together with an extensive electric suburban service. Subways beneath Broad Street, Ridge Avenue, Eighth and Locust streets were constructed at a cost in excess of $140 million.

Of numerous fine bridges, the most noteworthy are the Fairmount Avenue bridge, a double-deck truss structure completed in 1895, the great Benjamin Franklin Bridge across the Delaware River, which was completed in 1926 at a cost of nearly $25 million, and the Walt Whitman Bridge over the same river, completed in 1957 and costing $86 million.

Commerce. Philadelphia's high rank as a commercial city is primarily owing to its importance as a port; and its favorable location near vast supplies of raw materials has led to the development of immense industries. The city ranks first among the leading ports of the United States in the value of its foreign import commerce, and conducts a large coastwise trade, especially in oil and coal. Hog Island was purchased from the Federal government by the city in 1930 to be made into a huge sea, rail, and air terminal.

Manufactures. Three factors have made Philadelphia a great manufacturing center—nearness to the sources of raw materials, its advantageous situation as the natural outlet of great coal and iron fields, and excellent transportation facilities.

The city has the largest shipbuilding plant in the United States. The city leads in the quantity of rolling mill, foundry, and machine shop products, and in the manufacture of hats, carpets, and hosiery. In production of woolen and worsted goods, leather goods, and chemicals, in printing and publishing of books, newspapers, and periodicals, and in sugar refining, Philadelphia ranks among the chief manufacturing centers of the country. The League Island navy yard plant includes one of the country's largest aircraft factories.

History. The earliest settlement within the limits of Philadelphia was made in 1636 by a company of Swedes. Late in 1681, William Markham, deputy governor for William Penn, organized an English settlement, and, in 1682, under Penn's supervision, the city was laid out and named. In 1683, a colony of Germans, invited by Penn, settled at Germantown, now a part of the city. In 1723, Benjamin Franklin came to Philadelphia, and in 1729 began the publication of the *Pennsylvania Gazette*. Philadelphia took a leading part in resisting British aggression, and the most important official events of the Revolutionary War occurred in the city. The battle of Germantown was fought in 1777. Philadelphia was occupied by British armies, 1777–78, while Washington's army was at Valley Forge.

Philadelphia was the capital of Pennsylvania from 1683 to 1799, was the seat of the Federal government, 1790–1800, and was the financial center of the country until 1836. The first daily newspaper in the United States, the *Pennsylvania Packet*, appeared in Philadelphia in 1784. The Centennial Exposition, celebrating the centenary of American independence, was held in Fairmount Park in 1876. Philadelphia is called the "Quaker City" and also the "City of Brotherly Love," the latter being the meaning of its name, which is Greek. A popular New Year festivity in Philadelphia is the Mummers parade, a survival from an Old-World custom with modifications coming from American pioneer life. Population, 1970, 1,948,609.

Phoenix. The capital of Arizona, in the south central part of the state, about 400 miles east of Los Angeles. Phoenix is the commercial center of the Salt River Valley, the most productive agricultural region in the state. After the immense extension of irrigation following the construction of the Roosevelt Dam in 1911, the city grew rapidly. Among the crops are Egyptian cotton, alfalfa, cereals, oranges, grapefruit, figs, olives, cantaloupes, strawberries, and winter vegetables. The total value of the crops produced in Maricopa County, of which Phoenix is the county seat, far exceeds that of all the remainder of the state.

The city lies in a wide, irrigated plain surrounded by mountains. It has a mountain park of 14,000 acres 6 miles to the south. Its broad streets are ornamented with palms and other subtropical plants. Prominent public buildings are the Capitol and the City Library. By reason of its dry, salubrious climate, Phoenix is an important winter resort. In the vicinity are numerous points of interest, including Cactus Park, petroglyphics, and the ruins of Aztec community houses. Phoenix was settled in 1870 and became the capital of the territory in 1889. Population, 1970, 581,562.

Piedmont. The name used in the United States to designate that part of the Atlantic plain which lies between the low, flat coastal plain and the true Appalachian highland. It consists chiefly of rolling, rugged lands with deeply eroded valleys. The rocks are a harder formation than those underlying the coastal plain. In consequence, there is a definite line of escarpments, over which most of the rivers descend in rapids or cataracts. This is known as the "fall line." The piedmont plain reaches its greatest extent in Virginia, South Carolina, and North Carolina, being about 300 miles wide in the latter state.

Pierre (*pēr*). The capital of South Dakota, situated on the Missouri River in the central part of the state. It is located in an agricultural and stock raising district and is an important cattle shipping center. Besides the Capitol, Pierre has the State Library, a Federal school for Indians, and a fine Federal Building. The city's parks include the 1500-acre Farm Island in the Missouri River. Four miles upstream is Oahe Dam, the world's largest earth-rolled dam. Fort Pierre, established in 1832, was for many years the chief fur trading post of the Upper Missouri River country. Pierre was laid out in 1880 and was incorporated in 1883. Population, 1970, 9699.

Pikes Peak. A mountain in Colorado, 14,108 feet high, situated in the easternmost range of the Rockies immediately west of Colorado Springs. It was discovered in 1806 by General Zebulon M. Pike of the United States army, and was first successfully ascended in 1819 by Major S. H. Long. In 1891, a cogwheel railway was completed to the summit, which is now reached also by a well constructed automobile road.

While not the highest mountain in Colorado, Pikes Peak is one of the most majestic and imposing. Pine and spruce forests cover the slopes to an elevation of about 11,700 feet, above which there is a fringe of beautiful alpine flowering plants bordering the snow. The summit consists of bare granite rocks. The view from the top is one of unusual magnificence, including rugged mountains, vast plains, and numerous lakes and rivers in a landscape which extends 100 miles in all directions.

Pine Bluff. A distribution center for an agricultural region that produces cotton, livestock, and lumber, situated about 45 miles southeast of Little Rock, Arkansas. Most of the industry within the city is related to the products grown in the area. Pine Bluff is the seat of Arkansas Agricultural, Mechanical, and Normal College. Local residents claim the Civil War actually began in Pine Bluff. Population, 1970, 57,389.

Pinehurst. A noted winter resort of southern North Carolina, about 60 miles southwest of Raleigh. It is 125 miles from the seacoast and 13½ hours ride by rail from New York City, and possesses a mild and equable climate. It was founded as a winter resort in 1895 by James W. Tufts, of Boston, and is famous for the beauty and excellence of its parks, bridle paths, polo grounds, golf links, tennis courts, and other facilities for recreation. The permanent residential population is about 1500, but the winter visitors number 10,000 or more annually.

Piqua (*pĭk'wā*). A city in Miami County, Ohio, about 70 miles west of Columbus, in the center of a rich agricultural district. Its manufactures include knit underwear, walnut veneer, industrial fans and heating equipment, and other wood products. The first settlement was made in 1797. The outpost known as Fort Piqua, at this point, was an important supply base during the War of 1812. Population, 1970, 20,714.

PITTSBURGH. A city of Pennsylvania, situated at the junction of the Monongahela and Allegheny rivers, which here unite to form the Ohio. Pittsburgh lies in southwestern Pennsylvania, about 340 miles west of Philadelphia.

Site. Pittsburgh occupies the most irregular and uneven site of any on which a great American city is built. The three rivers flow through deep narrow valleys and the highlands bordering upon them are broken into a large number of hills. These rise to heights of from 500 to 740 feet above the rivers and are separated by great ravines.

The Monongahela River, from the southeast, is joined by the Allegheny, from the northeast; and the Ohio River, formed by their union, flows northwesterly to the city limits. The chief business district and the greater part of the city lies between the Monongahela and the Allegheny.

By annexation, there have been absorbed into the city more than 40 boroughs and townships. The names of many of these are still in common use locally, as, for example, Esplen, Beltzhoover, Sheraden, and Spring Garden.

Streets and Buildings. After World War II, Pittsburgh began a rebuilding program which converted the older downtown section into a "golden triangle." A 35-acre Point Park was created, and a civic arena was built with a retractable stainless-steel dome 415 feet in diameter and 136 feet high. The Boulevard of the Allies, a magnificent roadway overlooking the Monongahela, sweeps along the precipitous face of a cliff eastward from the business district to Forbes Avenue, which leads to Schenley Park.

By reason of its extremely hilly site, Pittsburgh has perhaps more bridges and viaducts than any other city in the world. The city owns and maintains over 125, including the Liberty bridge, which connects the business section with the South Hills district via the Liberty tubes. These are twin tubes 5714 feet long and cost nearly $6 million to construct. The Bloomfield bridge, spanning a deep valley between Herron Hill and the Bloomfield district, is nearly a mile long. The Larimer Avenue viaduct and the George Westinghouse bridge in East Pittsburgh have concrete arches ranking among the longest in America.

The commercial district, largely concentrated in "The Point," where the Monongahela and Allegheny rivers converge, is noted for its many fine office buildings of the skyscraper type, including the Grant, Koppers, Gulf, and Gateway Center buildings. Other imposing structures are the Courthouse, the Federal Building, Saint Paul's Cathedral, and Trinity Church.

Parks. The municipal park system includes 24 parks, covering a total area of more than 6000 acres. Of these, the finest is Schenley Park containing, within its 422 acres, the Carnegie Institute and Library, and the Phipps Conservatory. Highland Park, covering 366 acres, commands a superb panoramic view of the Allegheny valley. In this park, which contains a large zoological garden, there is a memorial building to Stephen C. Foster, author of "Old Folks at Home," who was born and lived in Pittsburgh. At the entrance of Riverview Park is the Allegheny Observatory. Other noteworthy parks are McKinley, Grandview, and Allegheny.

Public Institutions. Foremost among the public institutions of Pittsburgh are the magnificent buildings of the Carnegie Institute, which includes library, museum, art gallery, and music hall. This beautiful structure, which covers nearly 6 acres, is built in the Italian Renaissance style. Memorial Hall, containing a war museum and a large auditorium, is a notable structure. The Cathedral of Learning, a 40-story building 523 feet high and costing $6 million, houses the University of Pittsburgh. The Phipps Conservatory is one of the largest in America. All the above and many other buildings constitute a civic educational and social center at the entrance to Schenley Park.

Education. The chief educational institutions of the city are the University of Pittsburgh, Carnegie-Mellon University, Duquesne University, Chatham College, the Allegheny Observatory, and the Buhl Planetarium and Institute of Popular Science.

Transportation. Transportation, provided by the rivers and by railroads, and abundant fuel, in the form of coal, petroleum, and natural gas from nearby fields, are some of the factors which have made the city of Pittsburgh one of the great "workshops of the world." The rivers afford connections with an immense system of inland waterways,

including not only those of the state, but also those of the Midwest and the South. There is extensive river traffic between Pittsburgh and Cincinnati, Saint Louis, and New Orleans. The city is served by three passenger and five freight railway carriers. Because of the character of the commodities handled, largely coal, ores, and iron and steel products, the tonnage handled at Pittsburgh greatly exceeds that of any other inland river port.

MANUFACTURES. Pittsburgh, long known as "Steel City," is one of the leading centers of the world for the manufacture of iron and steel. About one-fifth of the steel made in the Western hemisphere is made in the Pittsburgh district. Pittsburgh leads all other cities in the manufacture of steel rails, aluminum, pressed steel cars, iron pipe and tubing, and pressed steel plates for shipbuilding. The city is also the chief center in the U.S. for the manufacture of coke, plate glass, window glass, and bottles, and produces a high quality of optical glass. Other important manufactures include aluminum wares, bronze and copper wares, refined petroleum, and aerospace materials. Adjacent to Pittsburgh is the world's first full-scale nuclear plant.

HISTORY. In colonial times, the vicinity of Pittsburgh was the scene of many struggles with the French and Indians. In 1753, the site of Pittsburgh was visited by George Washington who regarded it "extremely well situated for a fort." The French and Indians, however, drove off the Virginians, and built Fort Duquesne. Endeavoring, in 1755, to capture it, Braddock, with a strong British force, met disastrous defeat. In 1758, General Forbes, marching from Philadelphia, took the fort, and, at Washington's suggestion, renamed it in honor of William Pitt. The Block House, built in 1759, the oldest building in the city, is preserved as a relic of colonial days. Pittsburgh was laid out in 1784, was incorporated in 1794, and became a city in 1816. Population, 1970, 520,117.

Pittsfield. A city of western Massachusetts, situated in the Berkshire valley, near Pontoosuc Lake, with a background of fine mountain scenery. It is the largest city in the Berkshire Hills region, and is particularly noted for its wide, shaded streets, fine public buildings, and historic tradition. Its Museum of Natural History and Fine Arts contains the "one hoss shay," made famous by Oliver Wendell Holmes's poem. Holmes, Melville, and Longfellow resided for a time at Pittsfield, and H. W. Shaw ("Josh Billings") lived nearby. The city's industries produce plastics, transformers, bank note paper, textiles, machine tools, and silk. Population, 1970, 57,020.

Plymouth. A town on Plymouth harbor, Massachusetts, about 37 miles southeast of Boston. Founded by the Pilgrim Fathers in 1620, it is the oldest town in New England. Plymouth Rock, on which the Pilgrims are said to have landed, is preserved under a beautiful portico. Pilgrim Hall contains many interesting relics and historical paintings. A full-sized replica of the *Mayflower* has been moored at State Pier. The city is a port of entry, has varied local manufactures, and ships large quantities of cranberries grown in the vicinity. Population, 1970, 18,606.

Pocatello (*pō'kă-tĕl'ō*). A city of southeastern Idaho, about 170 miles north of Salt Lake City, Utah. Pocatello is situated in a region largely arid and volcanic, but highly productive by reason of irrigation. The city's industries consist largely of processing farm and dairy products. Pocatello is the seat of Idaho State University. Population, 1970, 40,036.

Pomona. A city in California, about 30 miles east of Los Angeles. Pomona ships the citrus fruits, walnuts, and various agricultural products grown in the area. Oil refineries are among its industrial establishments. Population, 1970, 87,384.

Ponce. The second largest city in Puerto Rico, located on the dry, southern coast of the island, about 8 miles southwest of San Juan. Its manufactures include clothing, textiles, paper, shoes, and canned tuna, fruits, and vegetables. It is a seaport and the seat of the Catholic University of Puerto Rico. Population, 1970, 125,926.

Pontiac. A city of southeastern Michigan, on the Clinton River, about 25 miles northwest of Detroit. Pontiac is the trade center of a rich farming and dairying region, and has developed extensive industries. The chief manufactures include automobiles, automobile accessories and parts, trucks, buses, paints and varnishes, tools, and machine shop products. Pontiac was settled in 1818, was incorporated in 1837, and, in 1861, was chartered as a city. It was named after the Indian chief. Population, 1970, 85,279.

Port Arthur. A seaport of southeastern Texas, situated on Sabine Lake, 12 miles from the Gulf of Mexico. Port Arthur is one of the largest oil refining centers in the United States. Since the completion of the Port Arthur ship canal, affording passage for large ocean vessels to its fine landlocked harbor, Port Arthur has become a leading port. The Neches River is spanned there by Rainbow Bridge (said to be the tallest bridge in the South over a navigable waterway), connecting Port Arthur and Orange. The city is the seat of Port Arthur College. Population, 1970, 57,371.

Portland. The commercial metropolis of Maine, located on Casco Bay, 108 miles northeast of Boston. It is built on two peninsulas, some encircling territory on the mainland, and islands totaling 2585 acres. Portland is an important seaport and possesses one of the finest harbors on the Atlantic coast. It occupies a picturesque site, with handsome buildings and streets closely bordered with trees. Its industries are extensive and varied, including iron forging, shoe manufacturing, cod and mackerel fishing, the canning of fish and vegetables, and lumber milling. Longfellow was born here. Population, 1970, 65,116.

Portland. The chief city of Oregon, situated on the Willamette River, about 12 miles from its junction with the Columbia, and approximately 100 miles by water from the Pacific Ocean. It occupies a commanding site on the sloping banks of the river, with the snow-capped peaks of Mount Hood, Saint Helens, and Mount Adams in the eastward background.

Portland owes its growth and importance to great natural advantages of situation. It is surrounded by highly fertile valleys and heavily timbered mountains, and has an excellent fresh-water harbor with 27 miles of deep water frontage. The exports consist mainly of grain, flour, lumber, and salmon.

In manufactures, Portland ranks among the leading cities of the Pacific states, its favorable situation enabling it to utilize vast resources of hydroelectric power, as well as natural gas. Among important manufactures are lumber, pulp, paper, clothing, automobile tires, and flour. The city's industries include also fruit canning and meat packing.

The city contains many imposing public buildings and is noted for its fine residences. It is the seat of Reed College and several schools of the University of Oregon besides various other educational institutions. Among features of interest are Council Crest, affording a panoramic view of the city and its surroundings; Terwilliger Boulevard on the west side of the city; Willamette Boulevard on the east side; and Washington Park, containing famous rose gardens and a fine statue of Sacagawea, a Shoshone Indian woman who guided the Lewis and Clark expedition. The environs of the city are reached by numerous scenic roads, including the famous Columbia River Highway, which extends 120 miles east, and 110 miles west to the sea. Portland is called the "Rose City." Its Rose Festival is a beautiful annual pageant.

Settlers from New England founded the city in 1844, naming it after Portland, Maine. Population, 1970, 382,619.

Portsmouth (*pōrts'mŭth*). The only seaport of New Hampshire, built near the mouth of the Piscataqua River, opposite the Maine boundary, about 60 miles north of Boston. The city carries on a substantial coastwise trade especially in coal, and has various local manufactures. Portsmouth was settled in 1623, and incorporated in 1849. It is a quiet city with a quaint, old-fashioned appearance, and contains many fine colonial houses rich in historic and literary interest. The Portsmouth navy yard, on an island in the river, is situated within the boundaries of Maine. In 1905, the Treaty of Portsmouth, ending the Russo-Japanese War, was signed in the "Peace Building" on Seavy's Island. Population, 1970, 25,717.

Portsmouth. A city of southern Ohio, built on the north bank of the Ohio River, at the mouth of the Scioto River, about 90 miles south of Columbus. It is protected from floods by a concrete wall 77 feet above normal water stage. The city is located in an agricultural and industrial region, of which it is the commercial center. Other important manufactures are steel and lumber products, shoes, paper boxes, and furniture. Portsmouth is near the Shawnee state forest, the Goodyear atomic plant, and the Roosevelt game preserve. In the Scioto valley, north of the city, are interesting remains of the ancient Mound Builders. Population, 1970, 27,633.

Portsmouth. A seaport of southeastern Virginia, occupying the mainland side of the important harbor of Norfolk-Portsmouth. Here the larger railway systems of the South have deep-water terminals and are connected with Norfolk, just across the harbor, by passenger and railroad car ferries. An immense tonnage, both foreign and domestic, passes through the port of Norfolk-Portsmouth. This consists chiefly of cotton, coal, lumber, fruits, vegetables, oysters, fertilizers, grain, coffee, and peanuts. This port is the greatest peanut market in the world. There are extensive industries, including railroad shops, fertilizer works, barrel factories, cottonseed oil mills, and lumber mills.

A few blocks south of the center of Portsmouth is the navy yard, officially known as the Norfolk navy yard. This occupies 350 acres, contains immense dry docks, and is the

most important naval establishment in the United States. Population, 1970, 109,827.

Poughkeepsie (*pō-kĭp'sĭ*). A city in New York State on the east bank of the Hudson River, about 75 miles north of New York City. It is picturesquely situated on high ground commanding a fine view of the Hudson River, which is here crossed by two magnificent bridges. The city conducts an extensive local trade. The chief manufactures include farm machinery, ball bearings, cough drops, cigars, and electronic data-processing machines. Poughkeepsie is the seat of Vassar College. Population, 1970, 32,029.

Princeton. A university town of central New Jersey, about 50 miles southwest of New York City. Founded in 1696, Princeton remained a straggling village until the College of New Jersey, now Princeton University, was removed, in 1756, from Newark to Princeton. It soon became a center of higher education and has remained distinctly a university town. Early in 1777, the battle of Princeton was fought in the vicinity. From June to November, 1783, Congress sat in Princeton. The town is built on an elevated site, commanding fine views of the surrounding country. It has broad, well shaded streets, and the architecture of its colonial period has been largely preserved. Besides the university, Princeton is also the seat of Princeton Theological Seminary, the Institute for Advanced Study, and the Westminster Choir College. Population, 1970, 12,311.

Providence. The capital of Rhode Island, and the second largest city of New England. It is situated on Narragansett Bay, about 45 miles southwest of Boston. The city has excellent railway facilities and a fine harbor.

While maintaining a substantial coastwise shipping trade, Providence is pre-eminently an industrial city, with extensive and varied manufactures. It is a leading center for the manufacture of jewelry, and for similar articles requiring a high degree of artistic skill. Among other important industrial products are abrasives, chemicals, precision tools, plastics, knit goods, pens, pencils, and rubber products.

The city is substantially built, and contains many fine parks and public buildings, including an imposing State Capitol and the beautiful Roger Williams Park. Brown University, chartered in 1764, and other important institutions are located in the city. Providence was founded and named in 1636 by Roger Williams, and here, in 1639, he organized the first Baptist Church in America. Population, 1970, 179,213.

Provincetown. A small town in Massachusetts, at the extreme outer edge of Cape Cod Bay, known to history as the first landing point to which the Pilgrims came in November of 1620, and the place where the Mayflower Compact was signed before the settlers sailed on to Plymouth. Once a thriving center of the whaling trade, the town is still engaged mainly in fishing industries, particularly in the marketing of cod and mackerel. In recent years, Provincetown has become well known as a gathering place for various artist groups, who make up a considerable part of its summer population. Some years ago, through the Provincetown Players, it gained fame as a proving ground for budding playwrights, of whom probably the best known were Susan Glaspell and Eugene O'Neill. Population, 1970, 2911.

Provo. A city of north central Utah, picturesquely situated in a fertile valley at the foot of the Wasatch Mountains, 44 miles south of Salt Lake City. Provo is the trade center of a rich irrigated district devoted to agriculture, fruit growing, and stock raising, and is the seat of Brigham Young University. Population, 1970, 53,131.

Pueblo (*pwĕb'lō*). The second largest commercial and industrial city in Colorado, located on the Arkansas River, about 120 miles south of Denver. Pueblo has immense iron and steel works, and is near a region rich in coal and oil. The city has also various other manufactories and extensive stockyards. There are many fine public buildings, including the State Historical Museum. Population, 1970, 97,453.

Quincy (*kwĭn'zĭ*). A manufacturing city of western Illinois, on the Mississippi River, about 110 miles northwest of Saint Louis. Built on the top of a limestone bluff, Quincy overlooks an enchanting panorama of river, valley, and surrounding hills. The city is the commercial center of a rich agricultural region. Its manufactures include electronic equipment, air compressors, pumps, ranges, truck and trailer bodies, poultry equipment, pulp-board, shoes, containers, and various dairy products. There are numerous fine parks, boulevards, and public buildings. The Mississippi is spanned here by a great bridge. Population, 1970, 45,288.

Quincy (*kwĭn'zĭ*). A city of eastern Massachusetts, situated on Quincy Bay, about 8 miles south of Boston. While essentially a residential suburb of Boston, Quincy has a large granite quarrying industry, and also huge shipyards, engine works, brass and iron works, rivet mills, and soap and aluminum factories. The city contains many fine streets and homes, and the park system covers 2614 acres.

Settled in 1625 as Mount Wollaston, Quincy ranks among the oldest permanent settlements in New England. Until 1792, when the community was incorporated under its present name, it was a part of Braintree. The first commercial railway in America was constructed here 1826–27 to transport granite used in building Bunker Hill Monument. Quincy enjoys the distinction of being the birthplace of two presidents, John Adams and John Quincy Adams, and also of John Hancock. Population, 1970, 87,966.

Racine. A manufacturing city of southeastern Wisconsin, located on a fine harbor on Lake Michigan, 65 miles north of Chicago. In value of its manufactures, Racine ranks second only to Milwaukee among the cities of the state, and is noted especially for the manufacture of threshing machines and farm implements. Other important manufactures include automobiles, machine shop products, furniture, hardware, and electrical equipment. Noted for its beautiful residential sections, Racine also has a park system covering 635 acres. More than one-third of the inhabitants are of Danish descent. Population, 1970, 95,162.

Rainier (*rā-nēr'*), **Mount.** The loftiest peak in the Cascade range, situated in southwestern Washington about 50 miles southeast of Tacoma. It rises to an elevation of 14,408 feet, overtopping all other summits in the Pacific states except Mount Whitney in California.

Like Fuji in Japan, Mount Rainier rises majestically in graceful lines that proclaim its volcanic origin. Its summit lies in perpetual snow and on its upper slopes there are numerous glaciers. These are from 50 to 500 feet thick and cover a total area of about 50 square miles. Some of these glaciers are from 4 to 6 miles long, and in size and beauty rival those of the Alps.

The lower slopes of the mountain are clothed with luxuriant forests, containing trees of unusual size. Above the forests, which extend to an elevation of about 7000 feet, are many picturesque mountain meadows. In summer, these bear a profusion of beautiful alpine flowers that follow the retreating snow banks almost up to the line of perpetual frost. The summit rises about 8000 feet above the general level of the Cascades and affords excellent views of the Puget Sound region. Mount Rainier, in 1899, was created a national park.

Raleigh (*rô'lĭ*). The capital of North Carolina, situated in the central part of the state. Raleigh is a large cotton and tobacco market and has varied industries, the manufacture of textiles, fertilizers, and cottonseed oil being among the more important. The city contains some 13 park areas, including Pullen Park, a 74-acre semiforest tract of exceptional beauty. Nearby is the house in which Andrew Johnson was born. The city's streets are wide and, for the most part, lined with beautiful shade trees. Among the more notable buildings are the State Capitol on grounds covering four acres, the Federal Post Office and Court Building, the State Agricultural Building, Sir Walter Hotel, Christ Church, and the Municipal Auditorium. Raleigh is the seat of North Carolina State University. The site of the city was selected for the state capital in 1792, and the city was founded in that year. Population, 1970, 121,577.

Reading (*red'ĭng*). A city of southeastern Pennsylvania, on the Schuylkill River, 58 miles northwest of Philadelphia. Situated in a rich agricultural region and near large fields of anthracite coal and iron ore, Reading possesses unusual commercial advantages. The chief industries are the manufacture of machine products, auto frames, and electric components. Other industries include railway maintenance and the manufacture of iron and steel, hosiery, castings, copper products, caskets, sweaters, paints, optical products, and building and fire brick.

Reading occupies a site between the base of Mount Penn and the Schuylkill River. The summits of Mount Penn, to the east, and Neversink Mountain, to the south, both rise to elevations of about 800 feet and command magnificent views. The city was laid out in 1748 in accordance with the plans of Thomas and Richard Penn, sons of William Penn. Daniel Boone was born near here. The early inhabitants were mostly German. Population, 1970, 87,643.

Redlands. A city of southern California, picturesquely situated in the foothills of the San Bernardino Mountains, about 60 miles east of Los Angeles. Redlands is a noted residential city, health resort, and educational center, in the heart of an immensely productive orange growing district. Smiley Heights, one of the city's numerous parks, affords a magnificent view of the surrounding region, embracing orange and lemon groves, grain fields, forests, and snow-capped mountains. The city is the seat of the University of Redlands. Population, 1970, 36,355.

Reno. The chief commercial and industrial city of Nevada, located near the western boundary of the state, about 30 miles northwest of Carson City. Reno lies in a sheltered valley near the eastern base of the Sierra Nevada mountains at an elevation of 4500 feet. It is on the Truckee River, which feeds the Truckee-Carson Canal, a government irrigation project that waters more than 100,000 acres. The city is the distributing center of an extensive region devoted to mining, farming, and stock raising. Reno's biggest single industry is tourism, with its related gaming and entertainment operations. The University of Nevada at Reno is located here. Population, 1970, 72,863.

Richmond. An important deep-water Pacific coast port across the bay from San Francisco. Settled on the coming of the railroad in 1899, its industries have shown remarkable development. These include oil-refining, food-processing, and metal fabrication. The Santa Fe railroad's western terminal shops are located here. Many persons are employed in research agencies and distributive industries. Large shipyards were constructed at Richmond during World War II. Population, 1970, 79,043.

Richmond. The capital of Virginia, located at the head of navigation on the James River, about 100 miles almost directly south of Washington. Richmond is an important railway center and has excellent air transportation facilities and a new deep-water river terminal. It is a leading tobacco market and one of the chief manufacturing centers of the South. Industries include packaging of many kinds, and the manufacture of tobacco in various forms, synthetic fibers, chemicals, drugs, paints, food, metals, and men's clothing.

The city occupies a commanding site, covering seven hills, and is sometimes styled the "Modern Rome." It is regularly laid out, rising in terraces from the river. There are many beautiful parks and imposing public buildings. Among the most noteworthy of the latter is the Capitol, designed after the Maison Carrée at Nimes, France, and built 1785–92. The city possesses many fine monumental and sculptural works, including the equestrian statue of Washington at Capitol Square.

Richmond is exceedingly rich in historic associations, and in colonial days, like Boston in New England, it played a prominent part in shaping the destinies of the country. In Saint John's Episcopal Church, in March 1775, Patrick Henry made his noted speech containing the famous exclamation, "Give me liberty or give me death!" From May 8, 1861, to April 2, 1865, it was the capital of the Confederate states. The executive mansion, occupied by Jefferson Davis, 1862–65, has been transformed into a Confederate Museum. The former residence of John Marshall, built in 1795, still stands; also the Lee mansion, occupied by General R. E. Lee's family during the Civil War. Richmond was established as a town in 1733, and chartered as a city in 1782. Population, 1970, 249,621.

Riverside. An important orange-growing center of southern California, situated on the Santa Ana River, 53 miles east of Los Angeles. Much of Riverside's beauty lies in thousands of acres of orange groves and in its 130,000 street trees. The city is noted for its distinctive "Indian rain cross" street lights, patterned after an ancient heathen symbol, prayed to for rain by the Navajo and Central American Indians. The "Parent" Naval Orange tree, from which all navel oranges in California's multimillion dollar citrus industry descended, still flourishes in a park in the center of the city.

Riverside conducts a substantial local trade, has large Portland cement works, and ships annually from its warehouses thousands of carloads of oranges. Riverside is widely known for the Mission Inn, containing numerous exhibits connected with the early Mission days of California. Riverside is the seat of the University of California at Riverside, California Baptist College, and Sherman Indian High School, among other educational institutions. Population, 1970, 140,089.

Roanoke. The chief industrial and mercantile city of southwestern Virginia is situated on the Roanoke River, 150 miles west of Richmond, in a picturesque valley between the Blue Ridge and the Allegheny mountains. As an electric power and transportation center, it affords ample facilities for the development of extensive industries which are diversified in character and number more than 250. Roanoke is a tourist mecca and is the headquarters of the Blue Ridge Parkway. Both Roanoke College and Hollins College are located here. Population, 1970, 92,115.

Rochester. A city of southeastern Minnesota, on the Zumbro River, about 80 miles southeast of Saint Paul. It is the trade center of a rich agricultural district and has substantial industries. The city is the seat of Saint Mary's Hospital and of the Mayo Clinic, founded by the surgeons Charles and William Mayo. The 19-story Plummer Building, which houses part of this clinic, has, in its tower, a 23-bell carillon as a soldiers' memorial. Population, 1970, 53,766.

Rochester. A city of west central New York, built on both banks of the Genesee River, at the Genesee Falls, and extending to Lake Ontario. Rochester ranks second in population and third in manufactures among the cities of the state. Factors which have contributed to its eminence as an industrial center are abundant power, derived from the falls of the river, and excellent transportation facilities afforded by Lake Ontario, the State Barge Canal, numerous rail and bus lines. It has a port on Lake Ontario.

The city's extensive manufactures embrace more than 350 different commodities. These are produced in upwards of 1700 factories and consist largely of articles requiring the employment of a high degree of mechanical skill. Rochester leads the world in the manufacture of photographic, optical, dental, check-protecting, industrial fluid-mixing, and gear-cutting equipment; process-control and recording instruments; enameled steel tanks; mail chutes; and thermometers.

Rochester occupies a nearly level site and is divided into two almost equal parts by the Genesee River, which is spanned by 12 bridges, some of which are 200 feet high. In the center of the city is the Upper Falls, 96 feet in height; below them the river flows in a deep gorge to the Lower Falls, 80 feet high. The park system, covering nearly 2000 acres in 12 units, is one of the most beautiful in America. Highland Park is world-famous for its displays of over 1500 lilac bushes of more than 500 varieties.

The city is the seat of the University of Rochester, Saint Bernard's Seminary, Rochester Institute of Technology, Colgate Rochester Divinity School, St. John Fisher College, Nazareth College, and other important educational institutions, and affords exceptional advantages for the study and enjoyment of art and music, particularly at the Eastman School of Music.

First permanently settled in 1812, Rochester was incorporated as a village in 1817 and chartered as a city in 1834. The completion, in 1825, of the Erie Canal greatly stimulated the city's growth. During the early period, when the Genesee valley was the chief wheat belt of the country, Rochester was known as the "Flour City." With the decline of milling and the rise of the nursery industry this sobriquet was changed to the "Flower City." Since the development of its great camera and photographic supply business, it has been styled the "Kodak City." Population, 1970, 296,233.

Rockford. A manufacturing city of Illinois, on the Rock River, about 90 miles northwest of Chicago. Abundant power, furnished by a great dam in the river, is utilized in its large and varied industries. Among these are the manufacture of machine tools, farm implements, furniture, and hardware. The city is the seat of Rockford College. A park in the center of the city contains the Turtle Indian mound. First settled in 1834, Rockford was chartered as a city in 1852. Population, 1970, 147,370.

Rock Island. A city of western Illinois, on the Mississippi River, adjoining Moline, and opposite Davenport, Iowa, with which it is connected by bridges including the four-lane Centennial bridge. These three cities with East Moline are called the Quad-City area. The city takes its name from an island in the river opposite the upper section of the town. Abundant hydroelectric power, provided by a government dam, has aided in the development of the city's substantial industries, which include the manufacture of agricultural implements, rubber footwear, food products, wood products, clothing, and concrete products. An immense government arsenal is located on the island. Rock Island was chartered as a city in 1841. Population, 1970, 50,166.

ROCKY MOUNTAIN NATIONAL PARK. An area of about 410 square miles in the heart of the Rocky Mountains, reserved as a national park in 1915. It is in north central Colorado about 50 miles northwest of Denver. It is traversed by the Continental Divide, which here rises to a height of over 14,000 feet and provides scenery of unsurpassed grandeur.

SIZE AND SURFACE. The park extends about 25 miles north and south, and from 12 to 20 miles from east to west. Altitudes within it range from 8000 to 14,256 feet above sea level, the highest point being Longs Peak, in the southeastern portion of the park, a mountain of the Snowy range. This range follows a general north and south direction. On its west side this mountain chain slopes gently down in a lovely region diversified by streams and charming lakes, the largest and deepest being Grand Lake. The eastern slope, however, is precipitous and awe-inspiring, bold summits standing out in daring relief separated by gorges with walls often 1000 to 2000 feet high. In the northern portion of the park are several peaks over 13,000 feet in height, including Hagues Peak and Mummy and Ypsilon mountains. Mount Copeland at the extreme south also exceeds 13,000 feet.

GLACIERS. There are few places on the earth where the effects of glacial erosion can be seen and understood so easily as in Rocky Mountain Park. Andrews glacier is the largest of those which still exist, but numerous huge moraines attest the stupendous force of these mountain-carving agents in past ages, when they were vastly more extensive. At Moraine Park is a ridge 800 feet high marking the lower edge of an ice-age glacier which crept down from Forest Canyon. The Mills moraine, at the foot of Longs Peak precipice, is 1000 feet high and four miles long. Glaciers still active seldom extend below an altitude of 12,000 feet. The timber line is reached at about 11,000 feet.

TRAVEL FACILITIES. There are four principal approaches to Rocky Mountain Park, three from the east converging at the hotel village of Estes Park, and one western approach known as the Grand Lake route. Motor highways also give access to the park from Denver, Boulder, and Grand Junction over these same approaches.

The park has over 300 miles of trails, but the principal scenic road is the Trail Ridge Road, which connects the western approach via Grand Lake with Estes Park. Following the crest of the Continental Divide for about three miles at an altitude of 11,800 feet, it is one of the highest roads in North America. It commands superb views of mountain peaks, chasms, waterfalls, glaciers, and mountain lakes.

ANIMALS. Rocky Mountain Park contains many bighorns, which particularly frequent Bighorn mountain, descending daily to drink from Sheep Lake in Horseshoe Park. Beavers are numerous, and much land on valley floors is marshy by reason of dams built by these animals. Deer abound and there are elk herds and some bears. The streams and lakes are stocked with fish from a hatchery in Estes Park.

Rome. A manufacturing city on the Mohawk River in New York, about 90 miles northwest of Albany. Its industrial output includes many items, but Rome is particularly noted for its copper and brass products, and has the largest fish hatchery in New York. Located in or near the city are the Rome State School for Mental Defectives; Griffiss Air Force Base; Fort Stanwix, claimed to be the place where, during the Revolutionary War, the Stars and Stripes were first flown in battle; and the grave of Francis Bellamy, author of the "Pledge of Allegiance to the Flag." Population, 1970, 47,655.

Roswell. This city in the Pecos valley in southeastern New Mexico owes its origin chiefly to its abundant water supply, having been known as an oasis even before the discovery of artesian wells there. A city of homes, with tributary cattle raising and oil industries, it is also prominent as a tourist center, one of its attractions being Bottomless Lake State Park. Educational institutions include Eastern New Mexico University at Roswell and New Mexico Military Institute. Population, 1970, 33,908.

Royal Gorge. The deepest part of the Grand Canyon of the Arkansas River. It is situated in central Colorado, 45 miles west of Pueblo. The entire canyon, about 8 miles long, has precipitous walls of eroded granite which rise to an immense height. In the portion a mile and a half long called the Royal Gorge, these titanic walls tower almost perpendicularly 2600 feet above the foaming torrent of the river. At the narrowest part, the stream fills the canyon nearly from wall to wall, and the railway passes through it over a bridge hung from transverse girders mortised into the rocks of both sides of the canyon.

Sacramento. The capital of California, located on the Sacramento River 90 miles northeast of San Francisco. Sacramento lies in the midst of a very rich farming and fruit growing region, and the most important of the city's varied industries is the canning of fruit. Among the other establishments are large railroad shops; factories making missile engines; flour, rice, and lumber mills; meat packing houses; and a huge air corps supply depot of the army. The city is built on the site of Sutter's Fort, the first settlement in California reached by the gold seekers of 1849 and 1850. The fort, rebuilt, houses relics of the pioneer days.

The handsome Capitol and a number of other state buildings form a multi-million dollar group in a beautiful 38-acre park in the center of the city. The park system covers about 1200 acres, the largest unit being Del Paso Park of 828 acres. Sacramento was incorporated in 1849 and became the state capital in 1854. A state college is located here. Population, 1970, 254,413.

Sagamore Hill. The country estate and residence of Theodore Roosevelt, situated near the town of Oyster Bay, on the northern shore of Long Island, about 30 miles northeast of New York City. In 1963, it was established as a national historic site. Young's Memorial Cemetery, which contains the grave of the former president, is also situated at Oyster Bay.

Saginaw. A city of southeastern Michigan, built at the head of navigation on the Saginaw River, 85 miles northwest of Detroit. The city lies in rich coal and oil fields and has immense supplies of hydroelectric power. There are many salt wells in the vicinity. Its industries produce, among other commodities, automobiles and parts, foundry and machine shop products, furniture, coal, beet sugar, and oil. Saginaw has extensive car shops. There are fine parks and public buildings, including hospitals and educational institutions. Population, 1970, 91,849.

Saint Augustine (*ô'gŭs-tēn'*). The oldest city in the United States, situated on the east coast of Florida, about 30 miles southeast of Jacksonville. Saint Augustine was founded in 1565 by the Spanish under Pedro Menendez de Aviles, sent by Philip II of Spain. With the exception of 20 years, 1763–83, when it was in the hands of the British, Saint Augustine remained a Spanish city until 1821, when the United States acquired Florida. In the old part of the town, the quaint, narrow streets are lined with ancient houses built of the shell material known as coquina. Many of these houses have overhanging balconies and are set amid gardens luxuriant with semitropical vegetation.

Among the many historic buildings are Fort Marion, the oldest fort in the United States, begun in 1656; the remodeled governor's palace; the Old Spanish Treasury; and the famous city gates. Saint Augustine is a noted winter resort and contains many fine hotels. Among these are the Alcazar and the palatial Ponce de Leon hotel, built in the Spanish Renaissance style. Population, 1970, 12,352.

Saint Joseph. A city of Missouri, built on the east bank of the Missouri River, about 60 miles north of Kansas City. The city lies picturesquely along the bluffs of the river. It is the center of a rich agricultural region with which it carries on a large merchandising and marketing trade. Saint Joseph is one of the leading live stock markets of the country, and contains several meat packing establishments. Its chief manufactures are packing-house products and flour products, including pancake flour. Other important manufactures include chemicals, malt beverages, paper products, and cans. Parks occupy about 1350 acres. A park about the Civic Center has a pony express monument, commemorating this service which began in 1860 between St. Joseph and Sacramento, Cal. Saint Joseph was first settled in 1826 by Joseph Robidoux, a French fur trader; it was incorporated in 1845 and became a city in 1851. Population, 1970, 72,691.

SAINT LOUIS (*lōō'ĭs*). The chief city of Missouri, situated on the Mississippi River, about 20 miles below the mouth of the Missouri.

SITE. Saint Louis occupies a commanding site, rising in a succession of gently sloping hills and depressions, each ridge toward the west ascending higher and finally reaching, at the western limits, an elevation of some 300 feet above the river. The boundaries are two curved lines, the crescent-like bend of the Mississippi on the east and an arbitrary boundary on the west. The total frontage on the river is more than 19 miles, the length of the western boundary is about 21 miles, and the maximum width is nearly 7 miles. The total area slightly exceeds 61 square miles.

STREETS AND BUILDINGS. In the small, older portion of the city, the streets are narrow and more or less irregular. The modern parts of the city have been laid out, wherever possible, with wide streets, crossing at right angles, and in north-and-south and east-and-west directions.

The Old Cathedral on Walnut Street is the most noteworthy example of the French period in the history of Saint Louis. Among the many notable modern buildings are the City Hall, which resembles an old French hotel de ville; the Union Station, in Renaissance style; the buildings of Washington University, in Tudor Gothic style; the Public Library, built of Maine granite in the early Italian Renaissance style, and the Art Museum and the Jefferson Memorial, in the classic style. Other noteworthy structures are the immense Saint Louis Cathedral, distinctly Romanesque; the Protestant Episcopal Cathedral, in modified Gothic; and the impressive Shaare Emeth Synagogue. A group of imposing buildings on Lindell Boulevard includes the Masonic Temple, the Shriners' Moolah Temple, and the Scottish Rite Cathedral. The tallest buildings include the Civil Courts Building and the 31-story Southwestern Bell Telephone Building.

No city in America excels Saint Louis in the beauty of its exclusive residential districts, called "places." In these are magnificent homes with spacious grounds reflecting the highest skill of the architect and the landscape gardener. Washington Terrace, Westmoreland, Kingsbury, and Portland rank among the most noted of the places. Other fine residential sections are found in Compton Heights, Hortense Place, Parkview, and in Hillcrest, and also along Forsyth and Lindell boulevards.

Saint Louis is distinctively a city of brick, and, with few exceptions, even the most elaborate mansions are built of this material. Owing to comparative cheapness of local

building materials, especially brick and limestone, a large percentage of the inhabitants live in separate homes.

Civic Improvements. A unique recreation facility is the Open Air Municipal theater located in Forest Park. A civic center on a memorial plaza, occupying 9 downtown blocks, accommodates an auditorium and other city buildings. A 37-block river-front area constitutes the Jefferson National Expansion Memorial, which commemorates the Louisiana Purchase and Westward expansion in the U.S., with a Gateway Arch, 630 feet high and from base to base, and a rich underground historical museum. Completed in 1966, the steel and concrete arch weighs 16,678 tons. Visitors may ride to the top of the arch in transit gondolas and from there view the city.

Parks. The city has 68 parks, covering an area of more than 3000 acres. Forest Park, the largest, containing 1381 acres, lies almost directly west of the business center. Other important recreation grounds are the Missouri Botanical Garden, Tower Grove, O'Fallon, Carondelet, and Lafayette parks. Forest Park has one of America's finest zoos and a $1.5 million planetarium. Several of the parks are ornamented with noteworthy works of sculpture, including statues of Shakespeare, Columbus, Jefferson, and St. Louis, the crusader king of France, for whom the city was named.

Educational Institutions. Among the leading educational institutions are the University of Missouri at St. Louis, Washington University, Saint Louis University, and Concordia and Eden seminaries. The Missouri Botanical Garden, founded by Henry Shaw and usually called Shaw's Garden, is now maintained for the public. It contains a fine arboretum and a collection of native and foreign plants, especially orchids, rivaling those of Kew Gardens in London.

Transportation. Two great advantages make Saint Louis pre-eminent as a commercial and industrial center. The first is its location in the heart of the great Mississippi valley, the most fertile agricultural region in the world. The second lies in its unsurpassed facilities for transportation. Barge lines handle an immense tonnage between Saint Paul and Minneapolis on the north and New Orleans on the south. Additional facilities include 16 trunk-line railroads, 9 scheduled airlines, and 5 major highways having access to 7 steel bridges across the Mississippi River.

Commerce. Saint Louis is the most important distributing center of the Mississippi valley, handling products representing the entire country. It is a great grain, live stock, horse, tobacco, and wool market and conducts an immense wholesaling trade.

Manufactures. In value of manufactures, Saint Louis ranks among the nine leading cities of the United States. Its extensive industries embrace the manufacture of an exceedingly wide range of products. It is one of the greatest shoe and tobacco manufacturing centers of the United States and has one of the world's largest breweries. Other important manufactures include packed meats, coke, blast furnace, foundry, machine shop, and rolling mill products, refined petroleum, clothing, chemicals, medicinal compounds, locomotive parts, aircraft, railway and rapid transit cars, jute goods, hot-air furnaces, stoves, clay products, automobiles, furs, and furniture.

History. Saint Louis was established in 1764 as a fur trading station by Pierre Laclède Liguest, assisted by Auguste Chouteau. Though under the control of Spain from 1770 to 1804, the place remained essentially French. In 1804, Saint Louis came into the possession of the United States by the Louisiana Purchase. The first newspaper was published in 1808, and, with the arrival of the first steamboat in 1815, a new era in the history of Saint Louis was opened. From 1840 to 1880, it passed 38 other American cities in population, and was passed by only one—Chicago. In 1904, the Louisiana Purchase exposition was held in the city. A feature of interest is the annual festival of the Veiled Prophet, somewhat similar to the Mardi Gras of New Orleans. Population, 1970, 622,236.

Saint Paul. The capital of Minnesota, built on both banks of the Mississippi River, immediately below Minneapolis. A part of the western boundary of Saint Paul is contiguous with the eastern limits of Minneapolis, but the commercial centers of these "Twin Cities" are about 10 miles apart.

The city is built chiefly on the left or east bank of the Mississippi, and occupies three terraces, rising in all from 100 to 200 feet above the river. The lowest section contains railway yards, stock yards, wholesale houses, and factories. Lying above this, on the middle terrace, is the commercial district and a part of the residential section. On the uppermost terrace, crowning the highest bluffs, is the fine residence section.

Saint Paul is admirably laid out, with many handsome streets, among the most scenic of which are Kellogg Boulevard and Summit Drive. The various parks, playgrounds, and connecting boulevards cover a total area of more than 2240 acres. In Como and Phalen parks there are picturesque lakes. Indian Mound Park affords unsurpassed views of the Mississippi River.

Foremost among the city's notable buildings is the beautiful State Capitol, constructed of marble and granite and containing many fine sculptural and mural decorations. Other fine structures are the Roman Catholic Cathedral, the Hill Memorial Library, the Minnesota Historical Building, and the Union railway station, completed in 1926 at a cost of $15 million. The beautiful buildings and grounds of the Minnesota Horticultural Society are at the northern end of the city. The annual state fair held here is one of the largest in the United States. Within the city are several important educational institutions, including Hamline University, Macalester College, Concordia College, Saint Thomas College, and the Saint Paul College of Law.

Saint Paul enjoys exceptional transportation facilities, both by rail and by river. On the completion of extensive canalization work in the Mississippi River, a barge service was opened in 1928. For a long period prior to this the river had scarcely been used for freight transfer although it had earlier been the main artery of commerce.

The St. Paul area is one of the great wholesale and jobbing centers of the country, with a total annual trade exceeding $500 million. The city is also an important market for live stock and, in manufactures, ranks second among the cities of the state. Prominent among the city's manufactures are railway cars, boots and shoes, fur goods, refrigerators, cordage and twine, law books, automobiles, glass, butter, and packed meats.

Settled in 1839, Saint Paul was made the territorial capital in 1849, and, upon the admission of Minnesota into the Union in 1858, was made the capital of the state. From about 1870, following the extensive building of railways and the settlement of the Northwest, the city grew rapidly. Population, 1970, 309,980.

Saint Petersburg. A summer and winter resort of western Florida, about 20 miles southwest of Tampa. The city is charmingly situated on Pinellas Peninsula with the Gulf of Mexico on the west and, on the south and east, Tampa Bay, which is here spanned by the 6-mile Gandy highway bridge. Extending 2400 feet into the bay is a million-dollar recreation pier. The city has 65 parks and 33 miles of water front. The post office is an open-air building, appropriate for the equable, sunny, subtropical climate which attracts an immense number of winter residents. Thousands of green benches on Central Avenue are a feature of the city. Population, 1970, 216,232.

Salem. A city of eastern Massachusetts, built on a peninsula between two inlets of the Atlantic Ocean, 16 miles northeast of Boston. Though irregularly laid out, Salem occupies an attractive site, with a fine drive along the north shore, and contains several beautiful parks. There are several very early colonial houses, numerous old mansions, dating from the period of the city's commercial supremacy, and many fine modern homes.

From early colonial years until about 1860, Salem was an important trading port. With the advent of steam navigation, its foreign commerce was largely transferred to Boston. The city still maintains an extensive coastwise trade, especially in coal. The substantial manufactures include cotton goods, games, radio tubes, leather, and shoes.

Salem is the seat of the Essex Institute, Peabody Museum, and Salem State College. Founded in 1626, Salem is one of the oldest cities of New England, and is rich in historical associations. In 1692, it was the scene of the Salem witchcraft delusion. Many early dwellings are well preserved, as, for example, Hawthorne's birthplace, the House of Seven Gables, and the witch jail, built in 1684. Population, 1970, 40,556.

Salem. The capital of Oregon, situated on the Willamette River in the northwestern portion of the state. Salem is the trade center of a fertile agricultural region; the industrial interests center about hop products, peppermint oil, linen, fruit and meat packing, mobile homes, and wood products. Wide streets and two public parks enhance the appearance of the city. Among the principal buildings are the Capitol, the Federal Building, and the Supreme Court Building. The city is the seat of Willamette University and of various state institutions. Salem was settled in 1840, was incorporated in 1853, and became the state capital in 1860. Population, 1970, 68,296.

Salt Lake City. The capital of Utah, the chief commercial city between Denver and San Francisco. The city is magnificently situated at the western base of the Wasatch Mountains, at an elevation of about 4300 feet above the sea, some 12 miles southeast of Great Salt Lake. It occupies a gently sloping site at the edge of a wide plain made highly fertile by irrigation. A noteworthy feature of the city is its unusually wide streets, at the sides of many of which run conduits bringing water from the mountains for freshening the vegetation of parks, lawns, and gardens. It has 7000 acres set aside as public parks.

Salt Lake City is the distributing center for a vast and rich region devoted to mining, stock raising, and agriculture. There are important mining interests, with large smelters and mineral mills in the city and vicinity. The city's industrial output includes petroleum and steel products, woolens, beet sugar, candy, salt.

In the heart of the city is Temple Square, containing the famous Mormon Tabernacle, a huge oval building capable of seating 8000 people; the impressive granite temple which took 40 years to erect (1853–93); and the large assembly hall built to accommodate 3000 persons. Among other fine buildings are the State Capitol and City and County building. Memory Park, east of the Capitol, commemorates local veterans of World War I. The city is the seat of the University of Utah, a State Normal school, and several other educational institutions.

Approximately 28 miles southwest of Salt Lake City at Bingham Canyon is the Bingham Copper Mine, the largest surface copper mine in North America.

Salt Lake City was founded by Brigham Young, the leader of a party of Mormons who arrived in the valley in 1847, and it has since been the headquarters of the Church of Jesus Christ of Latter-Day Saints. About 40 per cent of the people are Latter-Day Saints, who have more than 54 places of worship in the city. Population, 1970, 175,885.

Salton Sea. A brackish lake in the central depression of the Colorado Desert in southeastern California. Prior to 1905, this was a salt marsh interspersed with shallow saline ponds and lakes, covering an area about 30 miles long and 12 miles wide, with the surface lying about 280 feet below sea level. During the spring rains, however, the lake usually expanded into a body of water occupying an area of some 60 or 70 square miles, which, with the coming of the dry season, rapidly receded.

In 1905 and 1906, by an accidental inflow of water from the Colorado River, through defective irrigation canals, this watery marsh expanded into a lake 40 miles long, from 10 to 16 miles wide, and 90 feet deep, covering in all some 515 square miles. At its greatest height, the surface of the lake was only 194 feet below sea level.

After the inflow of water from the Colorado River was stopped in 1907, the lake receded as a result of evaporation until, by 1920, it covered only 265 square miles. Its surface was then approximately 250 feet below sea level. Since that time it has remained fairly stable, due to the inflow of natural drainage and a large volume of seepage and waste water from the irrigated lands in the Imperial Valley.

San Angelo. A city built near old Fort Concho on the river of that name in western Texas. It is a wool and mohair market and a distributing and shipping center for cattle, agricultural products, and oil. Manufactures include cottonseed oil, petroleum, surgical sutures, ceramic tile, skins and hides, and dairy products. Angelo State University is located here. An outstanding educational institution is the campus-type Central High School. Population, 1970, 63,884.

San Antonio. Next to San Augustine, the oldest city of Texas, situated on a river of the same name, 80 miles southwest of Austin. San Antonio is noted for its delightful and healthful climate and is the pleasure resort of thousands of visitors. On all sides are spacious grounds, luxuriant gardens, and an abundance of subtropical foliage and flowers. The 56 public parks and plazas cover 2200 acres. San Pedro Park, with its picturesque live oaks and its famous springs, is the original site of the Indian settlement of San Antonio. Many of the old buildings, especially the Alamo and San Fernando Cathedral, are full of historical interest. Fort Sam Houston is now the headquarters of the U.S. Fourth Army. Nearby are four important Air Force centers including Randolph Field and Kelly Air Force Base.

San Antonio is the commercial center of a large oil producing, agricultural and stock raising region, and is an important cattle, horse, and mule market. Its industrial establishments include oil refineries, flour mills, foundries, packing houses, cement works, and garment manufacturing.

The first permanent settlement was established in 1718 with the founding of the mission of San Antonio de Valero and the presidio of San Antonio de Bexar. In 1809 this settlement became a city. San Antonio was the scene of stirring events in the early history of Texas. Population, 1970, 654,153.

San Bernardino (*săn bûr'när-dē'nō*). A commercial and industrial city of southern California, about 60 miles east of Los Angeles. San Bernardino is situated in a beautiful valley surrounded by snow-capped mountains, near the entrance of the Cajon pass into the Mojave Desert. It is the trade center of a rich, irrigated district devoted chiefly to growing citrus fruits, grapes, and orchard crops. Its industrial establishments include large railroad shops, foundries, machine shops, and planing mills. First settled by Mormons in 1852, San Bernardino was incorporated as a town in 1868 and, in 1886, was chartered as a city. Population, 1970, 104,251.

San Diego (*dē-ă'gō*). Third largest city of California, with an excellent harbor on San Diego Bay, about 125 miles southeast of Los Angeles. The climate is mild and equable. Subtropical fruits flourish in the area. Among the leading industries are fish canning, the handling of fruits and fruit products, shipbuilding, and the growing of flowers, tomatoes, avocados, and citrus fruits. The manufactures include aircraft. The chief exports are fruits, honey, and citrus products.

San Diego is a United States naval base and one of the greatest naval aviation bases in America. It is also an important commercial aeronautical center, the airport, Lindbergh Field, being within five minutes' drive of the central business district. San Diego possesses many fine parks, Balboa Park alone having an area of 1400 acres. San Diego State College is located here. By reason of its climate and location, San Diego is a prominent health and travel resort. Among local points of interest are Coronado Beach, Fort Rosecrans, Point Loma, and Palomar Observatory. Population, 1970, 693,931.

SAN FRANCISCO. The principal seaport and manufacturing city of the Pacific coast of America, and second only to Los Angeles in population among the cities of the Pacific states. San Francisco is situated about 600 miles northwest of San Diego and about 900 miles south of Seattle.

Site. San Francisco occupies a magnificent site overlooking one of the finest natural harbors in the world. The city is built on the northern end of a semimountainous peninsula lying between the ocean on the west and San Francisco Bay on the east. The site, though generally sloping toward the east, is irregular, and embraces many bold hills, of which the highest, Twin Peaks, 925 feet high, separate the business district from the newer residential sections. The entrance from the ocean to the bay is through the Golden Gate, a narrow, rock-bound waterway whose attractive setting recalls Istanbul and Gibraltar. The city is connected with the north and east shores of the bay by two of the greatest suspension bridges in the world—Golden Gate and San Francisco-Oakland Bay.

Streets and Buildings. In general, the streets of the city are broad and straight, in some cases leading directly up steep hills. The district bounded approximately by Kearney and Stockton streets and by California and Pacific avenues, in the heart of the commercial section, is Chinatown, long a picturesque feature of the city. The level section south of Market Street contains the manufacturing district.

Of many imposing public buildings, the most important are those of the group forming the Civic Center, including the City Hall, the Public Library, and the Auditorium. Other notable buildings are the Post Office, the United States Mint, and the Union Ferry Building. Among the larger office buildings are the Southern Pacific Building, the Federal Reserve Bank, the Russ Building, 30 stories high, the Standard Oil Building, 22 stories high, the Hobart Building, 21 stories high, and the Claus Spreckles Building, 19 stories high, which withstood the ravages of the great fire of 1906.

Parks and Boulevards. The municipal park system includes 127 public recreation and park units covering 4043 acres. The chief of these, Golden Gate Park, covering 1013 acres, extends from near the center of the city west to the ocean. The principal points of scenic and historic interest are reached by an extensive system of boulevards and driveways. Those passing through the Presidio and Lincoln Park give fine views of the Golden Gate. These lead also past Sutro Baths and the Cliff House to the Great highway which runs close to the ocean for 3 miles. The historic Mission Road, the city's oldest thoroughfare, has been modernized. A boulevard extends to the top of Twin Peaks, whose lofty crest affords a splendid view.

Educational Institutions. Among the important educational and scientific institutions are the Memorial Museum, the California School of Fine Arts, the Mechanics Institute, the School of Mechanical Arts, the Cogswell Polytechnic Institute, and the San Francisco State College. The University of California is at Berkeley, across the bay; in San Francisco are located the affiliated colleges, which include the departments of medicine, dentistry, and pharmacy. Leland Stanford University is at Palo Alto, 33 miles distant.

Transportation. The harbor of San Francisco, completely sheltered from the sea by coastal hills, is one of the largest and safest on the globe. It has extensive docks, and is equipped with dry docks and other facilities for the care of vessels. The city is connected, by regular lines of steamships, with all ports on the Pacific coast of North and South America, with Atlantic seaports by way of the Panama Canal, and with Hawaii, the Philippines, Australia, China, and Japan.

San Francisco is the terminus of the Southern Pacific railway from New Orleans. Oakland, on the eastern side of the bay, is the terminus of three transcontinental systems, and connection with San Francisco across the bay is afforded by ferry and bridge services. Two systems of street railways and buses, one municipally owned and operated, provide local transportation.

COMMERCE. In foreign commerce, San Francisco ranks among the chief seaports of the country. The leading articles of export usually include canned fruits, canned salmon, raw cotton, iron and steel manufactures, grain, and oils. Among the principal imports are sugar, coffee, copra, burlap, tea, rubber, silk, and tin. The city also conducts an extensive coastwise commerce with other ports of the United States, and much Western produce is collected at San Francisco for distribution by rail.

FINANCE. San Francisco is the financial center of the Pacific coast. It is noted for the size and strength of its banking institutions, and is the headquarters of two of the largest banking organizations in America.

MANUFACTURES. San Francisco is, after Los Angeles, the leading city of the western United States in the total value of manufactured products. Crude petroleum, piped from vast oil fields, is extensively used for fuel. Among important industries are printing and publishing, meat packing, shipbuilding, coffee roasting, fruit canning, and the manufacture of paper products, furniture, confectionery, and paint.

FEATURES OF INTEREST. Among many noteworthy places of interest within the city and its environs are the Presidio, a large military reservation; the Cow Palace, Telegraph hill, Russian hill, and Twin Peaks, affording excellent views; Chinatown, with its Oriental character and aspect; the ocean shore at Cliff House; the celebrated Seal rocks, Mission Dolores, Mount Tamalpais and Muir Woods north of the Golden Gate; and Angel and Alcatraz islands the latter formerly a Federal prison island.

HISTORY. The site of San Francisco was visited in 1769 by Spaniards who called the place Yerba Buena. The first settlement began in 1776 with the establishment of Mission Dolores. In 1846, the United States took possession of California, and, in 1847, the name of the town was changed to San Francisco. Following the discovery of gold in California in 1848, the development of the town was spectacular, and, in 1850, it became a city. In 1862, telegraphic communication with the East was established, and, in 1869, the first transcontinental railway was completed. The most momentous event in the history of San Francisco was the earthquake of April 18, 1906, followed by a tremendous conflagration which almost totally destroyed the buildings on an area of more than 4 square miles, including the chief commercial and residential districts. Notwithstanding this enormous loss, the devastated area was rapidly rebuilt, and the city reconstructed on a grander and more substantial scale. Population, 1970, 715,674.

San Jose (*săn hō-sā'*). A city of west central California, situated in the beautiful and fertile Santa Clara valley, 50 miles southeast of San Francisco. It is in the midst of an important fruit growing region, and its principal commercial and industrial interests are connected with the cultivation of deciduous fruits. San Jose is noted for its salubrious climate and delightful gardens. Alum Rock Park, 776 acres in area, has 22 mineral springs, each with a grotto. San Jose possesses many fine buildings, including the San Jose State College. Lick Observatory, situated on Mount Hamilton, about 25 miles east of the city, attracts many visitors. The Ames Aeronautical and Space Research Laboratory is 9 miles north of the city. Population, 1970, 443,950.

San Juan (*săn hwän'*). The capital city and chief seaport of Puerto Rico. It is built on two small islands, San Juan and Santurce, connected by five modern bridges. It possesses an excellent harbor and several fine plazas and gardens. The Capitol is a beautiful building of white marble in the classic style. The chief industry is the manufacture of tobacco and the handling of sugar, grapefruit, pineapples, and other fruits. Various industries have sprung up and flourished under favorable leigslation known as The Industrial Incentives Act.

San Juan was founded about 1519 by Ponce de Leon. The main part of the city is surrounded by medieval ramparts. Morro Castle, built in 1584, stands on a promontory to the west. San Juan came into the possession of the United States by cession at the close of the Spanish American War. Population, 1970, 444,952.

Santa Ana. A city of California located about 80 miles northwest of San Diego. Once a citrus center, Santa Ana now has diversified industry, including electronics and beet sugar refining. Population, 1970, 156,601.

Santa Barbara (*săn'tà bär'bà-rà*). A city of southern California, situated on Santa Barbara channel, about 90 miles northwest of Los Angeles. Santa Barbara lies in a beautiful valley opening southward to the sea, but encircled on the north and east by the Santa Ynez Mountains. Closely paralleling the shore, the high coast range extends for many miles in an east-and-west direction, resulting in a remarkably mild and salubrious climate. The city is in the midst of an important farming, lemon growing, walnut growing, and stock raising region. A large proportion of the lima beans grown for market in the United States are produced in this district. The city is zoned to prohibit industries that are not "smokeless."

The Santa Barbara Mission, founded in 1786, stands in the northern part of the city, and is still occupied by Franciscan monks. Santa Barbara is widely known for its attractive buildings in Spanish architecture. An "Old Spanish Days" fiesta is held each August at the full of the moon. Santa Barbara is a noted all-year resort. Population, 1970, 70,215.

Santa Catalina (*kăt'à-lē'nà*). An island of southern California, separated from the mainland of Los Angeles county by San Pedro channel, some 20 miles wide. Santa Catalina is about 25 miles long and the average width is about 4 miles. The surface is semimountainous. Many interesting trees, shrubs, and other plants grow on the island, some of which do not occur elsewhere. The clear waters, remarkable for the beauty and variety of their marine life, are famous game-fishing grounds. Sea lions inhabit the south coast; flying fish are numerous in the channel, and whales are sometimes seen. The only town, Avalon, is a noted resort.

Santa Clara. A town in California, 47 miles southeast of San Francisco. Santa Clara was known for its fruits in the early mission days of California, and is still an important fruit-growing and packing center. It is the seat of the University of Santa Clara. Population, 1970, 87,717.

Santa Fe (*săn'tà fā'*). The capital of New Mexico, situated in the north central part of the state. First established in 1610, Santa Fe has ever since been the capital of New Mexico. The city was taken from Mexico by the United States in 1846. Stock raising is the main industry of the surrounding district. Indian pottery in large quantities is made by the Pueblo Indians.

The older part of the city has narrow, crooked streets with houses made of adobe or sun-dried brick. There are many buildings of historic interest: the Palace, beside a central plaza, where the Mexican governors resided; San Miguel Church; Cristo Rey Church; Scottish Rite Temple; and the State Art Museum, built in a mission style of architecture. The new capitol is round and styled as an Indian kiva. Population, 1970, 41,167.

Santa Monica. A city of southern California, on the Pacific Ocean, 16 miles west of downtown Los Angeles. By reason of its climate, bathing beaches, and boating facilities, Santa Monica is a popular year-round resort. Distinctive features include the Palisades Park and many fishing piers. Leading industries are electronics, aerospace research and development, missile production, plastics, ceramics, furniture making, and cosmetics manufacture. Population, 1970, 88,289.

Saratoga Springs. A city and famous watering place of eastern New York, about 30 miles almost directly north of Albany. It is noted for its numerous medicinal springs, which have made it one of the most attractive health resorts in America. The waters are bottled and shipped to various parts of the world. There are many recreational facilities.

Saratoga Springs was founded in 1789 and is the seat of Skidmore College for women. In a 30-acre park is the curious geological display known as the Petrified Sea Garden. The Saratoga battlefield, scene of Burgoyne's surrender and now a national historical park, is located 12 miles east of the city. Population, 1970, 18,845.

Sault Sainte Marie (*sōō' sânt mă-rē'*). A city of northern Michigan, on the Saint Mary's River, and opposite a town of the same name in Ontario. At this point are the famous rapids (the *Sault* or "rapids" of Saint Mary), which make navigation impossible for lake vessels. However, between Lake Superior and Lake Huron, navigation has been made possible for ships of the heaviest tonnage by an extensive system of canals and locks. Some 25,000 ships, carrying about 100 million tons of freight, pass through this waterway every year. Immense hydroelectric power, generated at the rapids, is utilized in the city's growing industries, the chief of which is the manufacture of calcium carbide. Other manufactories include planing, paper, and machine shops. Sault Sainte Marie is the oldest settlement in Michigan. Population, 1970, 15,136.

Savannah. The second largest city of Georgia, situated on the Savannah River, about 18 miles from the sea. It occupies a fine level site and has an excellent harbor. Savannah is the leading port on the southern Atlantic coast of the United States, and has also large exports of lumber, fertilizers, tobacco, and naval stores. It has extensive industries, which include the manufacture of cottonseed oils, fertilizers, resin, turpentine, refined sugar, foundry and machine shop products, paper, cloth and paper bags, and aircraft.

Savannah is noted for its well shaded streets and for its beautiful parks and gardens luxuriant with subtropical vegetation. The city was founded in 1733 and received its municipal charter in 1789. During the Revolutionary War it was captured by the British, and in the Civil War it was the objective of Sherman's march to the sea. Population, 1970, 114,155.

Schenectady. A city of eastern New York, located on the Mohawk River and the State Barge Canal, 16 miles northwest of Albany. The older parts of the city are built along the river, but the more modern sections occupy the surrounding hills. Schenectady is unique among American cities of its size in that about 90 per cent of its industry grew up through the building of locomotives and the manufacture of electrical machinery, apparatus, and supplies. It contains the laboratories and headquarters of the General Electric Company.

Schenectady was settled in 1661 and chartered as a town in 1798. In 1690, an attacking force of French and Indians massacred most of the inhabitants. The city is the seat of Union College, the second college incorporated in the state. Population, 1970, 77,859.

Scottsdale. A prosperous, residential suburb of Phoenix, Arizona. It is primarily a resort city, part of which has been reconstructed as an old Western town. Population, 1970, 66,852.

Scranton. A city of Pennsylvania, situated on the Lackawanna River, about 100 miles northwest of Philadelphia. Scranton occupies an undulating site surrounded by low mountains. It is the richest coal mining city in the world, being the center of the chief anthracite producing region of the United States.

Scranton is also a leading silk manufacturing center, and its other noteworthy industries include the manufacture of locomotives, iron and steel goods, knit goods, cotton lace, women's clothing, and tobacco products. The fine parks and the lake resorts in the nearby mountains make the city and its environs attractive. Scranton was founded in 1840, incorporated as a borough in 1854, and was chartered as a city in 1866. Population, 1970, 103,564.

Seattle. The chief city of Washington, and the second largest seaport of the Pacific states. It is built on the hilly eastern shore of Puget Sound, 933 miles by water north of San Francisco. The city occupies a commanding site between the Cascade and the Olympic range, with Puget Sound forming its western front, and Lake Washington lying on its eastern border. Evergreen Point floating bridge, 7518 feet long, connects Seattle with Bellevue.

Surrounded by a tributary region rich in timber, fisheries, minerals, and agricultural resources, and possessing exceptional facilities for transportation, Seattle has become one of the foremost commercial centers of the Pacific coast. It is the terminal point of several transcontinental railroads and has regular steamship connections with all parts of the world by way of the Panama Canal and the transpacific routes. In addition to other fine harbor facilities, a ship canal, 8½ miles long, situated wholly within the city, connects Puget Sound with Lake Union and Lake Washington. The leading exports of the port are wheat, flour, lumber, refined copper, automobiles, machinery, and fish; the imports are chiefly silk, rice, tea, coffee, sugar, copper ore, furs, and various Oriental products.

Seattle has one of the largest municipally owned hydroelectric power systems in the world. Industries include flour milling, food processing, shipbuilding, meat packing, lumber and wood products, airplanes, iron and steel products, and machinery. The fishery interests of Alaska and Puget Sound are largely centralized in Seattle which handles enormous quantities of canned salmon and other preserved fish.

Seattle contains many noteworthy buildings, among which are the Cathedral of Saint James, the Public Library, Art Museum, Northern Life Tower, and the Smith Tower, 42 stories high. The park and boulevard system embraces more than 1800 acres and includes upwards of 25 miles of scenic boulevards. The latter afford magnificent views of Mount Rainier and other snow-capped peaks of the Cascades. The campus of the University of Washington, covering 582 acres and situated between lakes Union and Washington, lies entirely within the city. Other educational institutions are Seattle University and Seattle Pacific College.

Seattle, named for a local Indian chief, was first settled in 1851. It was incorporated in 1865, and, in 1869, was chartered as a city. It was the site of the World's Fair in 1962. Population, 1970, 530,831.

Shasta, Mount. A majestic peak in the Sierra Nevada of northern California, situated about 40 miles south of the Oregon boundary. This great mountain, one of the most imposing on the continent, is an extinct volcanic cone which rises to an elevation of 14,380 feet. The summit is continuously covered with snow, and on the north slope there are several glaciers. About 1400 feet below the summit there is a crater nearly 4000 feet in diameter and 2500 feet deep. Although regarded as extinct, Mount Shasta still shows vestiges of volcanic activity. At the summit there is a sulphurous fumarole which emits hot gases, and on the north slope there is another similar opening. During one of the prehistoric eruptions of Mount Shasta, a stream of lava flowed down its southern slope, entered the channel of the Sacramento River, and followed the bed of that stream for a distance of 50 miles.

The influence of temperature and moisture upon the distribution of plant life is well illustrated in the strong contrast between the vegetation of Mount Shasta and that of Shasta valley. The summit of the mountain is devoid of vegetation because of cold; the Shasta valley, 10 miles distant, is treeless because of a lack of moisture. Between these extremes lies the great forest belt of Mount Shasta. In this heavily forested area the different species of trees are arranged in zones, according to the requirements of each species as regards temperature and moisture. For example, yellow pine and sugar pine predominate in the Transition zone at the foot of the mountain; Shasta fir in the Canadian zone midway on the slope; and whitebark pine in the Hudsonian zone, immediately below the upper limit of trees, at about 9500 feet altitude. Small alpine plants are found as high as 13,000 feet.

Mount Shasta may be ascended with little difficulty. From the city of Mount Shasta, a good trail, about 6 miles in length, leads to Timberline camp. From this camp, the summit may be reached and the return journey made to Mount Shasta city in a single day. The view from the summit of Mount Shasta is unsurpassed by that from any peak in the Cascade range.

Sheboygan (*shē-boi'gən*). A city of eastern Wisconsin, situated on Lake Michigan, 52 miles north of Milwaukee. The city is the trade center of a dairy and farming region and has diversified industries which include stainless steel and enameled kitchen ware, leather, knitted clothing, furniture, toys, molded plastics, shoes, electric sprayers, and hydraulic machinery. Fishing interests process large quantities for national distribution. Population, 1970, 48,484.

Sheridan. A mining and trade center of northern Wyoming. It is an important shipping point for farm products and livestock, and also for coal, which is mined extensively in the neighborhood. Industries include flour mills, sugar refineries, brick and tile works, and concrete plants. The Indian battles of Wolf Creek, Massacre Hill, and Great Wagon Box were fought in the vicinity, 1865–67. population, 1970, 10,856.

Shoshone (*shō-shō'nē*) **Falls.** A great cataract of the Snake River, in southern Idaho, about 120 miles southeast of Boise. This magnificent waterfall is exceeded in grandeur, in the United States, only by Niagara and by the falls in the Yosemite Valley. After coursing through a rocky canyon, some 1200 feet in depth, the deep river, here nearly 800 feet wide, first descends about 30 feet through several rocky channels. The waters then unite and the full volume of the river, in a single sheet, plunges over a precipice about 200 feet high, into the bottom of a narrow gorge. The cataract is easily reached from Twin Falls, about 5 miles distant.

Shreveport. The second largest city of Louisiana, on the Red River, in the northwestern part of the state, about 300 miles from New Orleans. The city has excellent railway facilities and is the commercial center of a large region, rich in oil, gas, lumber, and agricultural products. There is an extensive trade in cotton, corn, peanuts, pecans, fruit, truck crops, and live stock. The local industries include oil refineries, lumber, cotton, and cottonseed oil mills, glassworks, foundries, and machine shops. Industrial output includes also sulphur, salt, and glass. The Caddo Parish Court House is an 8-story building of unusual beauty, having a jail on the two top stories. Population, 1970, 182,064.

Sioux (*sōō*) **City.** A city of Iowa, located on the Missouri River, 200 miles northwest of Des Moines. Sioux City occupies a commanding site embracing parts of the river valley and the encircling bluffs. It is the commercial center of a highly productive agricultural region and has extensive wholesaling and shipping interests. It stands at the head of navigation in the Missouri River. The city is one of the important livestock markets of the country and has large meat packing establishments, creameries, and numerous other substantial industries. In total value of manufactured products, Sioux City ranks first among the cities of the state. There are many fine streets and public buildings, and the municipal park system covers an area of 1519 acres. The largest unit is Stone Park, a 915-acre natural wooded tract on the northwestern edge of the city. Grand View Park contains a music pavilion in a natural amphitheater.

Sioux City was founded in 1849 as an outfitting station for expeditions to the Black Hills, and received its municipal charter in 1857. It is the seat of Morningside College and of Briar Cliff College. Population, 1970, 85,925.

Sioux Falls. A city of South Dakota, on the Big Sioux River, about 320 miles southwest of Minneapolis. The river here falls nearly 100 feet. In the vicinity are extensive beds of quartzite, usually called jasper or red granite. Many buildings, both public and private, are built of this native pink stone. Meat packing, stone quarrying, and the manufacture of plastics and farm equipment are among the chief industries. Augustana College and Sioux Falls College are located here. Population, 1970, 72,488.

Sitka. A city on the west coast of Baranof Island, of southeastern Alaska. The chief industry is the processing and packing of salmon. Though located in a high northern latitude, the winters are not severe, and the general climate is healthful. Across the channel is a large naval air base. Nearby is the Sitka National Monument, a 54-acre park of great natural beauty and the scene of a massacre of Russians by Indians in 1802. Sitka was founded by the Russians in 1799 and later became the capital of the Russian territory of Alaska. From 1867 until 1906, Sitka was the capital of the United States territory of Alaska. Population, 1970, 3370.

Somerville. A residential city of eastern Massachusetts, on the Mystic River, two miles northwest of Boston. It is built on a series of hills and has many historic associations connected with the War of Independence. Paul Revere on his memorable ride passed through Somerville along a road now known as Broadway. Prospect Hill is said to be the scene of the first unfurling of the American flag. Meat packing, food processing, and the manufacture of paper bags are among the city's leading industries. Population, 1970, 88,779.

South Bend. A city of northern Indiana, built at the south bend of the Saint Joseph River, about 85 miles east of Chicago. South Bend has excellent railway facilities, is the commercial center of a rich agricultural and peppermint growing district, and has developed extensive manufacturing industries. The city contains large factories making airplanes and agricultural implements. Other important manufactures include lathes, knit goods, roofing, men's clothing, sewing machine parts, stoves, watches, and washing machines. There are 34 parks covering 623 acres. South Bend was founded in 1823 and was incorporated in 1865. The University of Notre Dame is situated in the environs of the city. Population, 1970, 125,580.

Southern Pines. A noted winter resort of North Carolina, situated some 70 miles south of Raleigh. It is located in a fruit growing region, producing berries, peaches, and grapes. By reason of its mild and equable climate, it is a favorite place of winter residence for people from the Northern states. Population, 1970, 5937.

Spartanburg. An industrial city of South Carolina, about 100 miles northwest of Columbia. It is located in a rich cotton-growing section, and has large cotton and textile mills. Other manufactures include machinery, office furniture, food products, ceramics, and apparel. Peaches and other fruit are grown nearby in large quantities and account for much of the income of the area. Spartanburg is the seat of Wofford College for men and Converse College for women. Population, 1970, 44,546.

Spokane (*spō'kăn'* . A city of Washington, located near the eastern border of the state. It occupies a site at the falls of the Spokane River, which, with other falls in the district, provide immense hydroelectric power for manufacturing. Served by three transcontinental railroads, Spokane has become the chief industrial city of the rich mining, lumbering, stock-raising, and agricultural region known as the "Inland Empire." Among important manufactures are aluminum, lumber products, dairy and meat products, apparel, metal products, flour, and cereals. The city has a system of parks embracing an area of more than 3000 acres, and is the seat of several educational institutions, including Whitworth College and Gonzaga University. The first settlement at Spokane was made in 1872 and, in 1881, the city was incorporated as Spokane Falls, becoming simply Spokane in 1890. Population, 1970, 170,516.

Springfield. The capital of Illinois, situated in the south central part of the state, 185 miles south of Chicago. The city is the center of a highly productive agricultural and coal mining district and has extensive manufacturing interests. Its industries include flour milling and textiles and the manufacture of electrical apparatus, agricultural implements, shoes, tractors, garage equipment, and road grading machinery. The Capitol, erected at a cost of $4.5 million, is built in the neoclassic style of architecture and surmounted by a lofty dome.

Among the points of historic interest are the former residence of President Lincoln and the Lincoln National Monument. The mausoleum in the latter contains the remains of the president. Springfield was first settled in 1818 and was made the capital of Illinois in 1837. Population, 1970, 91,753.

Springfield. A city of southwestern Massachusetts, built on the Connecticut River, about 100 miles southwest of Boston. Springfield occupies a site of great natural beauty on the east bank of the river, and possesses many fine public buildings. Among the most impressive of these is the municipal group, including the Administration Building, the Auditorium, and the Campanile. The top of the Campanile, 300 feet high, affords a magnificent view of the Connecticut valley. Other noteworthy structures are the Public Library, the Art Museum, the Science Museum, the United States Armory, and Trinity Church with a carillon of 61 bells.

Of the city's park system, embracing 1268 acres, the largest unit is the 757-acre Forest Park with a zoological garden. In Merrick Park stands the famous statue of "The Puritan" by Saint Gaudens. Springfield is the seat of the American International College, the Springfield Y. M. C. A. Training College, Springfield College, and Western New England College. Springfield's Naismith Basketball Hall of Fame enshrines many memorabilia of basketball.

The industries of the city are extensive and varied. Among the principal manufactures are firearms, chemicals, envelopes, electrical machinery, toys, and automobile tires.

Springfield was first settled in 1636 and was called Agawam. It assumed its present name in 1640 and, in 1852, was chartered as a city. The city was the center of hostilities in King Philip's War, 1675, and was the scene of various conflicts which took place during Shays's Rebellion, 1786–87. Population, 1970, 163,905.

Springfield. A city of southwestern Missouri, located on a plateau in the Ozark Mountains, about 230 miles southwest of Saint Louis. The city is the commercial center of a large farming, fruit-growing, dairy, and poultry region.

The city is the seat of Drury College, Southwest Missouri State College, Evangel College, and Central Bible College. Springfield was laid out in 1843 and, in 1847, was chartered as a city. In 1956, Springfield was designated as an "All America" city by the National Municipal League. Population, 1970, 120,096.

Springfield. A city of southwestern Ohio, 45 miles west of Columbus. It carries the trade of a rich agricultural region but is primarily an industrial center. Among its chief manufactures are farm implements, metallic caskets, motor trucks, gas engines, automobile parts, and electrical machinery. Here are located the state home of the Masons, the Knights of Pythias, and the Odd Fellows. Springfield is the seat of Wittenberg University. The first settlement was made here in 1799, when a fort was built on the site by Simon Kenton. Population, 1970, 81,926.

Stamford. A manufacturing and residential city of southwestern Connecticut, situated on Long Island Sound, 33 miles from New York City. Stamford is noted especially for the manufacture of mailing machines. Other important products are automobile parts, electric motors, furniture, oil burners, engines, and chemicals. The city was first settled in 1641 by a colony from New Haven, became a borough in 1830, and, in 1894, was chartered as a city. Population, 1970, 108,798.

Starved Rock. A perpendicular cliff of white sandstone, on the south bank of the Illinois River, near the town of Utica, about 90 miles southwest of Chicago. This cliff overhangs the water's edge and rises sheer to a height of about 160 feet. The walls of the fortress-like rock slope precipitously in all directions, and the top is reached by a single narrow rocky stairway. The flat summit, about half an acre, commands an excellent view of the fertile river valley, bordered by wooded hills and grassy slopes.

This almost inaccessible rock was the scene of many interesting events in the early history of Illinois. In 1673, Father Marquette and Joliet spent many weeks at Kaskaskia, the great village of the Illini Indians, in the valley near the rock. In 1681, La Salle and Tonti built a palisaded stronghold on the top of the rock, which they named Fort Saint Louis.

About 1770 occurred the tragic events which gave the cliff its present name. Here perished by starvation the last remnant of the once powerful Illini tribe. At a council at Cahokia, Pontiac, the famous chief of the Ottawas, was stabbed to death by an Illini warrior. Pontiac's followers swore a war of extinction against the Illini, finally entrapping the last survivors of the tribe in this natural fortress. An area of more than 800 acres, including Starved Rock and other historic points, is a state park.

Stockton. An industrial and commercial city of central California, situated 78 miles east of San Francisco on the San Joaquin River, which is deepened so as to be accessible to ocean-going ships. Stockton has important fruit, grain,

and livestock interests. Leading manufactures include canned and frozen foods, agricultural implements, and paper products. Stockton is the seat of the University of the Pacific. The settlement which became Stockton was founded in 1847 and was an outfitting point for miners during the gold rush. Population, 1970, 107,644.

Stone Mountain. A huge, cone-shaped hill of granite, located near the town of the same name, about 15 miles east of Atlanta, Georgia. It rises about 1000 feet above the surrounding country and covers an area of some 2 square miles. The surface is almost wholly naked rock. At the base of the northern slope there is an almost vertical cliff, about 800 feet high and 5000 feet long. In 1916, work was begun on a project for transformation of this cliff into a Confederate memorial by chiseling in bold relief figures of Confederate soldiers, centered on colossal figures of Lee, Davis, and Jackson. After many delays, the three central figures were completed and dedicated in 1970, although work remained to be done. The composition as it stands is 190 feet high and 305 feet long.

Superior. A city of northwestern Wisconsin, situated on Lake Superior and lying adjacent to Duluth, Minnesota. Possessing a fine harbor and excellent railway facilities, Superior shares with Duluth the advantages of location at the head of navigation on the Great Lakes. The city ships large quantities of iron ore and grain by water and receives coal to be distributed by rail to inland districts. Among the chief industries are planing and flour mills, iron and steel works, and shipyards. Superior is the seat of Wisconsin State University, Superior.

The early explorers, Radisson and Groseilliers, are supposed to have made their headquarters on the site of Superior in 1661. The explorer Du L'Hut, after whom Duluth was named, established a trading post here about 1680. Superior was laid out as a town in 1853, and, in 1889, was chartered as a city. Population, 1970, 32,237.

Syracuse. A city of New York State, located in the central part of the state, almost exactly midway between Albany and Buffalo, being about 150 miles from each of these cities. It occupies a fine, gently undulating site on Onondaga Lake, 35 miles south of Lake Ontario.

Syracuse owes its prominence as a commercial and industrial city to its central location in a highly productive region and to its superior transportation facilities. It is served by numerous railways which radiate in all directions and by the State Barge Canal system, which affords water transportation north to Lake Ontario, west to Lake Erie, and east to the Hudson River. The city has extensive shipping interests and conducts a large wholesale trade.

Syracuse has upwards of 750 industrial establishments, producing a great variety of articles. Among important manufactures are typewriters, air conditioning equipment, soda ash, tool steel, candles, agricultural implements, chemicals, ceramics, and washing machines.

The commercial district is substantially built, largely of brick and of the native Onondaga limestone, and contains many imposing buildings. The residential sections are noted for their broad, well-shaded streets, and handsome residences and grounds. There are about 60 public parks, ranging in size from small plots at street intersections to spacious tracts such as Burnet Park, on the west, covering 120 acres. Lincoln Park on the east, affords a beautiful view of the city and its environs.

The city is the seat of Syracuse University, with which is connected the State College of Forestry. Le Moyne College also is located here. Another institution, located permanently at Syracuse, is the State Fair.

The site of Syracuse originally belonged to the Onondaga Indians, whose survivors occupy a small reservation south of the city. The salt springs, long known to the Indians, became known to white settlers in 1789. The first settlement on the present site of the city was made about 1805. This was named Syracuse in 1819 and was chartered as a city in 1847. Population, 1970, 197,208.

Tacoma (*tá-kō'mä*). A city and port of western Washington, built on a fine harbor on Puget Sound, about 30 miles south of Seattle. It occupies a commanding site, rising to an elevation of several hundred feet overlooking the sound, in a beautiful scenic region between the Olympic and the Cascade mountains. Mount Rainier lies about 56 miles southeast.

The city has a substantial wholesale trade, large manufacturing industries, and an extensive coastwise and foreign commerce. The leading manufactures include lumber, furniture, pulp and paper, and machine shop products. Tacoma contains many fine public buildings, has several picturesque parks, in all covering 1200 acres. It is the seat of University of Puget Sound and Pacific Lutheran University. Old Tacoma, founded in 1868, and New Tacoma, founded in 1873, united in 1883 to form Tacoma. Population, 1970, 154,581.

Tahoe (*tä'hō*; *tä'hō*), **Lake.** A beautiful lake, situated at the eastern base of the Sierra Nevada mountains, at an elevation of 6275 feet above sea level. The boundary line between California and Nevada passes through the lake, which lies about 85 miles (direct) northeast of Sacramento and 12 miles west of Carson City. It is about 20 miles long and from 8 to 12 miles wide, with an extreme depth exceeding 1650 feet. Its remarkably clear waters are discharged through the Truckee River, eastward into Pyramid Lake, Nevada. Lake Tahoe is a favorite summer resort.

Tallahassee. The capital of Florida and seat of Florida State University and Florida Agricultural and Mechanical University. It is the trade center of a rich dairying and poultry region, which also grows corn, tobacco, cotton, vegetables, pecans, figs, grapes, and blueberries. Tallahassee is located 20 miles from the Gulf of Mexico, on rolling hills. Among the principal buildings are the State Capitol, the Governor's Mansion, and the Federal Building. Tallahassee became the state capital in 1824. It was the only capital not captured by Union troops during the Civil War. Population, 1970, 71,897.

Tamalpais (*tăm'ăl-pīs'*), **Mount.** A mountain in the Coast range of California, situated on the Marin Peninsula, about 15 miles in direct line northwest of San Francisco. The triple summit, about 2600 feet high, affords unsurpassed views of the surrounding region.

To the south are the Golden Gate, the city of San Francisco, and, far beyond them, Mount Hamilton, 4444 feet high, on which the Lick Observatory is situated. To the east is San Francisco Bay, with Oakland, Berkeley, and other cities on its eastern shore. Beyond these are the Contra Costa Hills and Mount Diablo, the latter rising nearly 4000 feet high. Close by to the north is the reservoir called Lake Lagunitos, and in the distance are ridge after ridge of the Coast range. On the west is the ocean and the rocky Farallon Islands, lying far out at sea. Within walking distance from West Peak is Muir Woods, with its superb forest of sequoias, many of which are 300 feet high. Muir Woods is a national monument.

Tampa. A manufacturing city and winter resort of west central Florida, located at the head of Tampa Bay, an inlet of the Gulf of Mexico. The city has a good harbor and is served by various steamer lines. A large part of the world's supply of Havana cigars is manufactured at Tampa. Other products include cement, phosphate fertilizer, canned citrus fruit, and beer. Among the city's features are the semitropical Plant Park, where Tampa University is situated; and the Tampa Greyhound Track. Davis Island, a fine residential district, is a result of an extensive reclamation project. Two universities are located in Tampa. Population, 1970, 277,767.

Taos (*tä'ŏs*). An Indian pueblo and village of northern New Mexico, built near the Rio Grande River, about 50 miles north of Santa Fe. The inhabitants are of Taonan Indian stock. Like all pueblo dwellers, the people of Taos are industrious and self-supporting. Population, 1970, 1030.

Tarrytown. A village of New York State on the Hudson River 25 miles north of New York City. It is noted as the scene of numerous skirmishes in the Revolutionary War. Major John André was captured in the vicinity. The village contains "Sunnyside," the home of Washington Irving, who made famous the neighboring valley, Sleepy Hollow. Its factories include an automobile assembly plant. Nearby is the Tappan Zee Bridge, connecting with the New York Thruway. Population, 1970, 11,115.

Terre Haute (*tĕr'ē hōt'*). A railroad center and manufacturing city of west central Indiana, situated on a high bank of the Wabash River, 73 miles southwest of Indianapolis. The city is the commercial center of a rich agricultural and manufacturing district. Among the chief industries are paper mills, foundries, and the manufacture of plastics, chemicals, and phonograph records. Parks, 20 in number, cover 717 acres. The city is the seat of the Rose Polytechnic Institute, Indiana State University, and, just west of the city, St. Mary-of-the-Woods College. Population, 1970, 70,286.

Thousand Islands. A numerous group of islands in the Saint Lawrence River, located immediately northeast of Lake Ontario. They are situated in an expansion of the river, 40 miles long and from 3 to 7 miles wide. Some of the islands are many acres in extent, but many are mere rocky islets. A large number belong to Canada, 14 of them forming part of the Saint Lawrence Islands National Park, and others are a part of the State of New York. Their attractive scenic setting, together with their cool climate, make the Thousand Islands an ideal place for summer recreation.

Ticonderoga. A village of northeastern New York situated on the creek connecting Lake George with Lake

Champlain, about 95 miles north of Albany. Paper and lumber are its chief industrial products. Because of its many associations with the French and Indian War and the Revolutionary War, Ticonderoga and its environs possess great historic interest. At this point, the French erected, in 1755, a fort which they called Fort Carillon. In 1757, this was heavily garrisoned by Montcalm, but, in 1759, it was taken by the English under General Amherst.

In the Revolutionary War, this stronghold, renamed Fort Ticonderoga, was captured from the English by Ethan Allen and his "Green Mountain Boys." Later, it was retaken by Burgoyne and held until his surrender. The fort fell into disuse but has since been restored and contains a valuable museum. Population, 1970, 3268.

Toledo. A city of Ohio, located about 95 miles directly west of Cleveland and abutting Michigan. It occupies both banks of the Maumee River at its mouth in an inlet of Lake Erie, which provides a seven-mile commercial channel.

Toledo owes its commercial and industrial prominence to its advantageous location at the head of direct water transportation to the East and to its good railway facilities. It is surrounded by a rich agricultural region, with which it maintains an extensive trade, particularly of wheat and soybeans. Toledo is one of the largest distributing points of the Great Lakes for soft coal and is an important oil-refining center.

Toledo has more than 1000 industrial establishments, whose chief products include refined petroleum, auto parts, glass, tools, electrical machinery, ships, and scales.

There are many notable public buildings, among which are the Museum of Art and Our Lady of the Holy Rosary Cathedral, an outstanding example of Spanish architectural design. The park system, covering more than 1500 acres, includes several large parks and some 45 smaller ones. Among noteworthy educational institutions is the University of Toledo, maintained by the state. Toledo was founded in 1837 by the consolidation of two earlier settlements. Population, 1970, 383,818.

Topeka. The capital of Kansas, situated on Kansas River about 70 miles west of Kansas City. It is an important railroad center, being served by four railroad systems and having the extensive car shops of the Santa Fe railroad. An outstanding industry is the publication of farm journals which circulate widely throughout the Middle West. Meat packing, flour milling, and the manufacture of butter are other important industrial interests. The Capitol stands in the center of a beautiful park area. Among other features of the city are a 9-acre rose and rock garden and the 572-acre Lake Shawnee Park. Educational institutions include Washburn University and the Mulvane Art Museum.

Topeka was laid out in 1854 as one of the "free state" towns. In 1856 an antislavery convention there adopted the Topeka constitution, establishing a Topeka government, which was broken up by Federal troops. It became a city in 1857 and capital of the state in 1861. Population, 1970, 125,011.

Trenton. The capital of New Jersey, built on the eastern bank of the Delaware River, at the head of tidewater navigation, about 30 miles northeast of Philadelphia. Proximity to the coal fields of Pennsylvania and to the markets of New York and Philadelphia has contributed to its growth as an industrial center. Among its extensive and varied manufactures, the most noted is that of pottery, which ranks among the finest produced in the United States. Other important industries include the manufacture of wire cables, bridge sections, engines, electric lamps, rubber products, and linoleum.

The city is regularly laid out with many fine public buildings and residences. Among the more notable public buildings are the State Capitol, the Federal Building, the Courthouse, the new State Cultural Center, and Trenton State College. A landmark of historic interest is Battle Monument surmounted by a colossal statue of Washington, which commemorates his command on the battlefield of Trenton. Trenton became a city in 1792. Population, 1970, 104,638.

Troy. A manufacturing city of east central New York. It is situated six miles north of Albany at the head of tidewater navigation on the Hudson River. Once famous as a center for the manufacture of collars and shirts, Troy's manufactures now include ordnance, abrasives, shirts, springs, radiators, brake linings, silicone products, and steel. The chief educational institutions are Rensselaer Polytechnic Institute and Russell Sage College for women. The beautiful Hart-Cluett mansion is maintained as a museum.

The vicinity of Troy was the scene of internecine struggles between the Mohawk and the Mohican Indians, and during the Revolutionary War was the theater of stirring American activities in resisting Burgoyne's invasion. Henry Burden founded his famous ironworks here in the early nineteenth century. Population, 1970, 62,918.

Tucson (*tōō-sŏn′*). A city of Arizona, situated in the southern part of the state, about 65 miles north of the Mexican border. It is the commercial center of a large district devoted to stock raising, mining, and farming. Many new companies engaged in research and engineering science have located in Tucson recently. Tucson is the seat of the University of Arizona and other educational institutions. The warm, dry climate makes it a tourist and health center. A replica of the walled city of Tucson as it looked in 1859 stands 13 miles away, having been erected in making the motion picture *Arizona*, and still being used for similar purposes. Population, 1970, 262,933.

Tulsa. A city of Oklahoma, on the Arkansas River, about 100 miles northeast of Oklahoma City. Tulsa is situated in one of the richest oil and natural gas fields in America. To the immense development of these resources, the city owes its remarkably rapid growth. More than 500 operating and refining oil companies are located in the city. The surrounding district also contains valuable deposits of coal.

The city is the trade center of a large outlying region devoted to farming, stock raising, and dairying, and, by reason of cheap and abundant fuel, has developed substantial industries. Among the chief of these are oil refining, flour and lumber milling, and the manufacture of aircraft, boilers, tools, stoves, and glass.

Tulsa occupies a fine, gently rolling site, and is well laid out, with many beautiful parks, boulevards, and handsome homes built by fortunes made in the oil fields. Mohawk Park covers 2400 acres. The business district is noted for its impressive array of modern office buildings, including the 21-story Philtower Building and the 27-story tower of the Exchange National Bank Building. The city is the seat of Tulsa University and the Philbrook Art Center and Indian Museum. Tulsa was founded in 1887 and was first chartered as a city in 1902. Population, 1970, 330,409.

Tuscaloosa. Located on the Black Warrior River in Alabama, 58 miles southwest of Birmingham, Tuscaloosa is the seat of the University of Alabama and Stillman College. Manufactures, such as paper, lumber, iron, chemicals, building materials, and food products, have become more important to the area than the cotton crop that once made it prosper. Population, 1970, 65,773.

Union City. A city of eastern New Jersey, adjoining Hoboken and Jersey City. It was formed in 1925 by a consolidation of the old towns of West Hoboken and Union. Weehawken, adjoining Union City on the east and fronting on the Hudson River, is the railroad terminal and port. Union City is a residential place for persons employed in New York City and Jersey City. It has also many local industries, their output including embroidery, silk, cement products, and rubber goods. Population, 1970, 58,537.

Utica. A city of central New York, situated on the Mohawk River and the State Barge Canal, about 95 miles west of Albany. Utica is the commercial center of a rich dairy-farming district. Important manufactures include fabricated metal products, men's clothing, textiles, heating and ventilating apparatus, and iron and steel forgings. Utica is an important railway center and transfer point, and is often called the "Gateway to the Adirondacks." Its $4 million Munson-Williams-Proctor Institute has brought new cultural opportunities to Utica. Population, 1970, 91,611.

Vallejo (*vă-yā′hō*; *vă-lā′ō*). A city of western California, located on an arm of San Pablo Bay, opposite Mare Island, about 25 miles northeast of San Francisco. Mare Island Navy Yard contributes substantially to the commerce of the city. The city's industrial products include flour, lumber, and dairy products. Vallejo was founded in 1851 and was planned as the capital of the state. The legislature held sessions in Vallejo, 1851–53. Population, 1970, 66,733.

Valley Forge. A village on the Schuylkill River, in eastern Pennsylvania, about 20 miles west of Philadelphia. Valley Forge is famous as the place where Washington and the Colonial army of about 11,000 men endured terrible privations during the severe winter of 1777–78. The area with the trenches thrown up by the "ragged Continentals" remains substantially unchanged, and the old stone house where Washington made his headquarters still stands. An area of 2048 acres, including the old camp site, comprises Valley Forge State Park. The site is occupied by replicas of soldiers' huts and by monuments to generals Washington, Wayne, and von Steuben.

Vancouver. A city of southwestern Washington, on the Columbia River, about 8 miles north of Portland, Oregon. The chief manufactures include lumber, aluminum pulp and paper, canned fruit, metal castings, and machine shop products. A long interstate bridge over the Columbia River

connects Vancouver with Oregon. Vancouver was established in 1825 by the Hudson's Bay Company and was incorporated in 1858. Population, 1970, 42,588.

Vicksburg. Located on high bluffs overlooking the Mississippi River, Vicksburg is an important tourist, industrial, and river port city 45 miles west of Jackson, Miss. The U.S. Army Corps, with three major agencies, is the city's largest employer. The chief industries, most of which depend on the river for cheap transportation or processing water, produce lighting fixtures, earth-moving equipment, chemicals, hardwood lumber and flooring, feeds, house trailers, and boats.

Incorporated in 1825, Vicksburg gained special prominence during the Civil War. Its capture by the Union forces after a prolonged campaign was one of the decisive events of the great struggle between the North and the South. The Vicksburg National Military Park, of 1648 acres, with 30 miles of driveways and many monuments, restores the battleground as it was in 1863. Population, 1970, 25,478.

Vincennes (*vĭn-sĕnz'*). A city of southwestern Indiana, on the Wabash River. It is the oldest settlement in the state, dating from 1727, when Sieur de Vincennes built a fortification there. A French trading post had been erected on the site as early as 1702. The city is in a rich agricultural region and has varied industrial interests, including structural steel, storage batteries, paper products, glass, shoes, and flour.

Vincennes was under the French flag until 1777, was held by the British until 1779, and was taken by American troops in 1779 under George Rogers Clark, to whom is erected a $2 million memorial on the river front. The house still stands where the first territorial legislature met in 1805. Vincennes having been capital of Indian Territory from 1800 to 1813. Crossing of the Wabash River at this point by the Lincoln family in 1830 while migrating to Illinois is memorialized by a bridge, a marble shrine, and life-size bronze statue of Abraham Lincoln. Population, 1970, 19,867.

Waco. A city of east central Texas, on the Brazos River, 100 miles south of Dallas. Waco is the trade and shipping center of a rich agricultural region. The city is a leading cotton market for the interior of the state and has substantial industries. The principal manufactures are textiles, twine, woodwork, tents, awnings, camp furniture, clothing, and cement. Waco is the seat of Baylor University. The city was laid out in 1849 and was named for the Huaco Indians. Population, 1970, 95,326.

Walla Walla. A city of southeastern Washington, situated near the Oregon boundary. Walla Walla is the trade center of a fertile agricultural district. The manufactures include farm machinery, flour, and lumber. The city is the seat of Whitman College and Walla Walla College. At Waiilatpu, seven miles west, is a national monument park commemorating the first white family settling in the Pacific Northwest, that of Dr. Marcus Whitman, who founded a mission there in 1836. The original Fort Walla Walla is now a veterans' hospital. Population, 1970, 23,619.

Walpi. A Hopi Indian village built on a lofty mesa, several hundred feet high, overlooking an arid desert in north central Arizona. The inhabitants are among the most interesting of the Pueblo tribes. These peaceful village dwellers steadfastly adhere to their aboriginal culture and ancient customs. Their houses are constructed of adobe or of stone set in clay mortar, with square rooms and flat roofs, through which trap doors provide entrances.

The elaborate ceremonials of the Hopi people include the celebrated snake dance, in which the performers carry living rattlesnakes. The Hopi are industrious farmers, and maintain abundant stores of corn, beans, and vegetables. They also weave excellent blankets and baskets and display great skill as potters and wood carvers. The village contains about 150 inhabitants.

Waltham (*wŏl'thăm*). A city of eastern Massachusetts, situated on the Charles River, about 10 miles west of Boston. Here in 1854 was made the first successful attempt to manufacture watch movements, on an extensive scale, by machinery. Industries in Waltham are engaged in the manufacture of watches, clocks, knit goods, precision machinery, radar equipment, batteries, and jewel bearings. Other manufactures include emery wheels and furniture.

A point of interest is Norumbega Tower, named in allusion to a fabulous city said by early explorers to be located in New England. Waltham was incorporated in 1738 and was chartered as a city in 1884. A mill established there in 1814 is said to have been the first complete power mill for the making of cotton cloth in America. Population, 1970, 61,582.

Warren. An industrial city in northern Ohio, situated on the Mahoning River, 14 miles northwest of Youngstown. It has good transportation facilities and manufactures steel, automobile parts, tires, electrical products, fire protection equipment, drinking fountains, and many other items. Population, 1970, 63,494.

Warwick. This city is a residential suburb of Providence, Rhode Island, and is situated on the Pawtuxet and Providence rivers in a region of quiet towns and villages. It has some industry, including the manufacture of textiles and the shipping of clams, oysters, and scallops. It was the birthplace of General Nathanael Greene, a hero of the American Revolutionary War. Population, 1970, 83,694.

WASHINGTON. The capital of the United States, situated on the left bank of the Potomac River, about 100 miles from its mouth. Washington is coextensive with the District of Columbia. It is the administrative, legislative, and judicial center of the nation.

Site and Plan. The site was chosen by a commission headed by George Washington, and the city was planned by L'Enfant, a noted French engineer. Congress transferred its sittings from Philadelphia to the new capital in 1800. The city was captured and burned in 1814 by the British. At the time of the Civil War, it was fortified and made the headquarters of the Northern army. Following 1871, important improvements were made in the city, mainly in accordance with the original plan drawn up by L'Enfant. In the 1930's still greater improvements were made particularly the construction of monumental government offices occupying a triangle south of Pennsylvania Avenue. In 1962, President Kennedy appointed a commission to draw up plans for a much more radical improvement. One aspect of the plans called for a second triangle of buildings north of Pennsylvania Avenue, some governmental and others privately owned but architecturally suitable. In addition, an immense National Square would be created at the White House end. The plans envisaged several levels of construction, including underground parking areas, arcades for shopping facilities, and large areas accessible only to pedestrians. To President Kennedy is due also initiation of the Kennedy Cultural Center to the west on the Potomac River.

From 1802 until 1871, Washington's affairs were managed, under a charter, by its own citizens. In 1871 the charter was revoked, and the city was placed directly under the management of the Federal government. In 1961, the XXIII amendment gave residents of the District of Columbia the right to vote in presidential elections.

Area and Surface. The District of Columbia is about 70 square miles in area, including 8 square miles of water surface. The surface, on the whole, is gently undulating and the elevation of the land in the District varies within a range of approximately 400 feet.

Streets. The streets are laid out on a rectangular plan modified by a system of 26 avenues, which intersect the streets at different angles. A number of avenues converge on the two focal points of the city, namely, the Capitol and the executive mansion, or White House, the line of Pennsylvania Avenue passing through both points of intersection. The streets and avenues are from 80 to 160 feet in width, many of them adorned on each side with a double row of trees.

Parks and Malls. In a central square stands a lofty monument erected to the memory of George Washington. Extending north, east, and west from this square are long, parklike areas, or malls. The north mall leads to the White House; the area to the east is the approach to the Capitol; and to the west of the monument along a reflecting pool stretches a vista terminating in the Lincoln Memorial. Small parks and open squares or circles are found in various parts of the city. Potomac Park consists of about 723 acres of land which has been largely reclaimed from the Potomac River. The "tidal basin" is partially surrounded by Japanese cherry trees. Rock Creek Park, covering approximately 1600 acres, is a hilly tract of great natural beauty extending along both sides of the creek, which flows south, and widening at one point to form the picturesque National Zoological Park, covering 170 acres.

Monuments. The monuments and buildings of Washington befit the dignity of the national capital. The Washington Monument, already mentioned, is a majestic obelisk 555 feet in height. The stately Lincoln Memorial takes the form of a Greek temple of the Doric order. It is surrounded by a peristyle of 36 columns, one for each of the states of the Union at the time of Lincoln's presidency. In the interior is a statue, heroic in size, of the martyred president. On the shore of the tidal basin rises the circular, dome-crowned memorial to Thomas Jefferson. A striking monument in the Washington area is the U. S. Marine Corps War Memorial showing the flag-raising on Iwo Jima. Most of the numerous circles throughout the city where avenues cross are adorned with colossal statues of national heroes.

Buildings. The buildings of Washington, which are among the most beautiful in America, are characterized in general by the neoclassical type of architecture. The Cap-

itol, a magnificent structure of the Corinthian order, having two immense wings and surmounted by a beautiful dome, occupies a commanding position on an eminence east of the Mall. The White House exhibits a pleasing and noble simplicity. The Library of Congress, containing one of the world's largest collections of books, is an imposing structure in the Renaissance style, near which stands the annex, modernistic in design. The Treasury, like the Supreme Court building, is an example of pure Greek architecture. One of the city's most exquisite structures is the Folger Shakespearean library.

The diverging lines of Constitution and Pennsylvania avenues form a triangular wedge of monumental buildings extending from the Apex Building, nearest the Capitol, to the Department of Commerce Building and the Treasury Building, near the White House. This group includes the Archives and Internal Revenue buildings and structures housing the justice, post-office, labor and interior departments. South of this group are the Department of Agriculture building, the Smithsonian Institution, and the Natural History and History and Technology museums. Nearer to the Capitol is the National Gallery of Art. West of the triangle are the Federal Reserve and Interior Department buildings.

Other notable structures include the Pentagon, the Corcoran Art Gallery, Constitution Hall, the State, War and Navy Building, the State Department Building, National Academy of Sciences, Pan-American, Red Cross, and Bureau of Engraving and Printing Buildings. The Health, Education and Welfare building and the National Aeronautic and Space Administration building are on Independence Avenue facing the Mall. Notable too are the National Geographic building with its fine exhibits and numerous high-rise office and apartment buildings in newer architectural styles. Ford's Theater, where President Lincoln was assassinated has been completely restored.

The Naval Observatory is the source from which the official time is telegraphed to all parts of the country. Among Washington's many fine churches are the National Cathedral of Saint Peter and Saint Paul, Gothic in architecture, where President Wilson is buried, and the Franciscan Monastery, which contains a replica of part of the catacombs at Rome. In the northeastern part of the city is the Catholic Shrine of the Immaculate Conception, crowned with a colored tile dome, which is offset by a bell tower 329 feet high with a carillon of 56 bells.

COMMERCE. The industries of Washington are devoted largely to the service of the government and to the supplying of local needs. The city's mercantile business, however, is very extensive. Scientific research plays a large role. Local travel is facilitated by a high-speed belt highway. As a national and international center of travel, it is served by three airports, of which Dulles airport is one of the world's finest.

EDUCATIONAL INSTITUTIONS The institutions of learning and research are numerous. They include George Washington University, Catholic University of America, American University, the Smithsonian Institution, the Carnegie Institution of Washington, Georgetown University, and Howard University. The Washington Academy of Sciences serves as "federal head" for many learned societies.

POINTS OF INTEREST. The city and its environs are rich in historical associations. Mount Vernon, the home of Washington, lies on the right bank of the river, about 15 miles below the city. Across the Potomac from the Lincoln Memorial, in Virginia, is Arlington National Cemetery, containing a beautiful memorial amphitheater and the grave of three of the nation's Unknown Soldiers. This cemetery is connected with Washington by the beautiful Arlington Memorial Bridge. To the north of the city lie the Naval Hospital with its conspicuous tower, the widespreading National Health Institutes, the impressive Bureau of Standards building, and the headquarters of the Atomic Energy Commission.

During the Civil War, Washington was surrounded by a ring of 68 forts. Of these, only Fort Myer on Arlington Heights opposite the city is occupied, being used as a training center. Population, 1970, 756,189.

Washington, Mount. The highest peak in the White Mountains of New Hampshire, and the loftiest summit in the northeastern United States. It rises from the massive Presidential range, in the central part of the White Mountain group, and reaches an elevation of 6288 feet. It lies east of Crawford Notch and is about 140 miles almost directly north of Boston.

The mountain is composed chiefly of granite. The east and north sides are gashed with deep gorges and the west slope is precipitous. The rocky summit, which rises many hundred feet above timber line, has a scant covering of alpine vegetation; the lower slopes are extensively forested. Trails, highways, and a rack-and-pinion railroad make it easy for travelers to reach the summit, on which are a government meteorological station and a commodious hotel.

Waterbury. A city of southwestern Connecticut, on the Naugatuck River, 32 miles southwest of Hartford. Abundant water power has contributed largely to the city's industrial prominence. Waterbury is the leading center for the manufacture of brass ware in the United States, and is often styled the "Brass City." It is noted also for the production of clocks and watches. In value of manufactures, Waterbury ranks among the first two or three cities of the state. The city occupies a hilly site and contains parks of great natural beauty. Population, 1970, 108,033.

Waterloo. A city in Iowa on the Cedar River about 110 miles northeast of Des Moines. The surrounding country produces grain, hogs, cattle, and dairy products in great abundance. It is one of the largest manufacturing centers in the state, being noted especially for the manufacture of tractors and other agricultural implements. Waterloo is served by four railroads, one air line, and 32 trucking lines, and is on three federal highways. It is the home of the National Dairy Cattle Congress. Population, 1970, 75,533.

Watkins Glen. A narrow gorge of unusual scenic beauty, situated near the village of Watkins Glen, New York, not far from the head of Seneca Lake, and about 20 miles north of Elmira. Through this chasm, which, in places, is 300 feet deep, a narrow stream flows over a series of charming cascades and rapids. The rocks, which are Devonian shales, were worn into deep gorges by glacial ice.

Waukegan. A lake port and industrial city in the northeast corner of Illinois. Although it has distinct individuality and local pride in educational and other civic enterprises, Waukegan is closely associated with North Chicago in matters of commerce, industry, and transportation. Population, 1970, 65,269.

West Point. A strong military post and noted military educational center in New York State. It occupies a picturesque site on the west bank of the Hudson River, about 50 miles north of New York City. The government reservation, including Constitution Island, covers 3574 acres and is the seat of the United States Military Academy. It has a great repository for the storing of monetary silver. Among many fine buildings and monuments are Memorial Hall, containing trophies of war, and a handsome equestrian statue of George Washington. West Point was a position of great strategic importance in the Revolutionary War. Benedict Arnold plotted, while in command here, to betray it to the British, but this result was prevented by the timely discovery of the plot.

Wheat Belt. The name applied to the section of the United States in which more than three-fourths of the nation's wheat crop is grown. In reality, there are two wheat belts, the winter wheat belt and the spring wheat belt.

The winter wheat belt has two parts. One stretches from Ohio to eastern Colorado, and the other consists of north central Montana and the Pacific Northwest. The chief producing area for winter wheat includes southern Nebraska, Kansas, western Oklahoma, northern Texas, eastern Colorado, north central Montana, Idaho, eastern Washington, Missouri, Illinois, Indiana, and Ohio. The spring wheat belt consists chiefly of North Dakota, South Dakota, Minnesota, and eastern Montana.

Wheeling. A city of West Virginia, on the Ohio River, in the northern "panhandle," about 65 miles southwest of Pittsburgh, Pennsylvania. Wheeling owes its industrial and commercial importance to large supplies of natural gas, to extensive nearby coal fields, and to abundant raw materials, made available by excellent facilities for transportation, both by rail and by water. There are more than 200 manufacturing establishments in Wheeling, and the total value of its products is greater than that of any other city in the state. The leading manufactures include iron and steel products, plastics, glass, tobacco, tin plate, and aluminum ware. There are also print works, packing houses, and large proprietary remedy works.

The city occupies an excellent site, rising gradually from the river, and contains many fine streets and public buildings. Oglebay Park, of 1200 acres, is a country recreational center. Wheeling Island is connected with the main part of the city by a historic suspension bridge.

The first settlement on the site of Wheeling was made in 1769 by Ebenezer Zane. Fort Henry, named for Patrick Henry, was built in 1774 and, during the Revolutionary War, was repeatedly, but unsuccessfully, attacked by the Indians and the British. Wheeling was incorporated in 1795 and was chartered as a city in 1836. From 1863 to 1870, and again from 1875 to 1885, Wheeling was the capital of the state. Population, 1970, 48,188.

White Plains. A city of southern New York about 25 miles north of midtown New York. Here in 1776, Washington's army was attacked by a superior force of British and succeeded in withdrawing across the Hudson River. Population, 1970, 50,220

White Sands National Monument. Located in south central New Mexico, in the vicinity of White Sands Proving Ground (a rocket test site) and about 15 miles from Alamogordo (the site of the explosion of the first atomic bomb in 1945). This national monument is 140,247 acres of dazzling white dunes, which extend far beyond the boundaries appropriated for the monument itself. The dunes range from 5 to 50 feet high and consist of 95% pure gypsum, grading into quartz sand in the north. The dunes are not continuous, but occur in waves, with bare ground showing between them. They move constantly, always in a northeasterly direction and very slowly, shifting a few feet a year. There is a strange, boggy lake bed, Lake Lucero, in the southwest corner of the monument area. It is said that no life can exist in it. Mice, insects, and beetles, which are numerous in the White Sands area, are white or nearly white, apparently a protective coloration. Plant life is confined to the outer stretches of the sands and differs from similar species elsewhere.

White Sulphur Springs. A health and pleasure resort of southeastern West Virginia, located in picturesque Greenbrier County. Famed for its numerous mineral springs, this historic spa and fashion center, dating back to Revolutionary War times, is visited annually by thousands of tourists. Japanese diplomats in Washington at the time of the attack on Pearl Harbor were interned here during World War II. Population, 1970, 2396.

Whitney, Mount. The highest peak in the United States, excluding Alaska. It is situated in the main range of the Sierra Nevada, in eastern California, and is surrounded by a region of unusual scenic magnificence. Its eastern slope rises precipitously nearly 11,000 feet above Owens Valley, and the peak itself towers to an elevation of 14,495 feet above sea level. The lowest land in North America, Death Valley, much of which is below sea level, lies only 86 miles east of this gigantic mountain.

Whittier. A city of California, situated about 12 miles southeast of Los Angeles. It was founded by Quakers and named for the poet John Greenleaf Whittier. It is a residential city, once a citrus empire, now a hub of industry and a packing and shipping point for agricultural products grown in the area. It is the seat of Whittier College and the world's largest Quaker church. Population, 1970, 72,863.

Wichita. A city of Kansas where 64% of the world's private aircraft are manufactured. Beech Aircraft Corporation, the Boeing Company—Wichita Division, Cessna Aircraft Company, and Gates Learjet Corporation are major aircraft plants located in the city. Wichita is also a milling and meat-packing center. Wichita's industry is varied, with manufactures of farm machinery, heating equipment, amusement park equipment, hotel and motel equipment, and camping equipment. The city occupies an excellent site on the banks of the Arkansas River in central Kansas. Three institutions of higher learning are located here—Friends University, Sacred Heart College, and Wichita State University. The city's name was derived from the Wichita tribe of Indians. Settled in 1870, Wichita was incorporated in 1871. A living historical monument recalls the city's origin in a section called "Cowtown," which contains many of the original structures of early Wichita. Population, 1970, 276,554.

Wichita Falls. A city of northern Texas, on the Wichita River, about 100 miles northwest of Fort Worth. Wichita Falls is the distributing point for a large agricultural and stock raising region, and is the center of a rich petroleum oil and gas field. Its principal manufactures are window glass, auto trucks, flour, and oil well machinery. The refining of petroleum is one of the most important industries. Wichita Falls was settled in 1882 and was chartered as a city in 1884. It is the seat of Midwestern University. Population, 1970, 97,564.

Wilkes-Barre (*wĭlks' băr'i*). A city of northeastern Pennsylvania, on the Susquehanna River, about 100 miles northwest of Philadelphia. It is situated in the picturesque Wyoming Valley and is the center of one of the richest anthracite coal fields in the world. Its manufactures include electronic components, furniture, cigars, pencils and writing supplies, aircraft and missle parts, perfumes, malt beverages, clothing, fiber glass, shoes, wire rope, and boilers.

Wilkes-Barre is the seat of Wilkes and King's colleges. Two major annual events include the Fine Arts Fiesta and the Cherry Blossom Time festival, both held in May.

Wilkes-Barre was settled in 1769 by New Englanders, and named in honor of John Wilkes and Isaac Barre, members of the British Parliament. It was the scene of desperate struggles with the British and Indians during the Revolutionary War; the Wyoming massacre took place four miles from its site. The city is noted as the birthplace of the anthracite coal industry. Here "stone coal," as it was called, was first used for domestic purposes. Population, 1970, 58,856.

Williamsburg. A historic city of eastern Virginia, 48 miles east by south of Richmond, in a peninsula between the James and York rivers. It was settled in 1632 and was known as Middle Plantation until 1699. From 1699 to 1780 it was the capital of Virginia. It is the seat of William and Mary College, opened in 1693, which, after Harvard, is the oldest college in the United States.

In 1927, under the active interest of John D. Rockefeller, Jr., the restoration of the colonial area of Williamsburg was undertaken. Among the many restored structures are the original college building, designed by Sir Christopher Wren, and the Raleigh Tavern, where the Virginia assembly met when dissolved by royal governors. Recently erected business structures are made to conform with the earlier architectural style. Here in 1776 the Phi Beta Kappa society was organized. Population, 1970, 9069.

Willimantic. A city of Connecticut, located 28 miles east of Hartford, at the junction of the Willimantic and Natchaug rivers. It has been styled the "Thread City," having produced thread extensively since 1822. The city has other industry and is in the midst of a fertile farm area. It is the seat of Eastern Connecticut State College. Population, 1970, 14,402.

Wilmington. The chief city of Delaware, located on the Delaware River, at its junction with Christina River, about 27 miles southwest of Philadelphia.

The favorable location, excellent transportation facilities, nearness to the great coal fields and the sources of raw material, together with water power furnished by the Christina, have combined to make the city an important manufacturing center. The Du Pont chemical industries center in Wilmington, the city of their origin. They began as a powder mill, established in 1802, the first in America. Other important manufactures are braided rubber hose, leather belting, castings, cork products, iron and steel articles, hosiery, machinery, paper, and petroleum products. Immense powder and dye mills, across the river in New Jersey, contribute substantially to the city's trade.

The town was founded in 1638 by Swedes and was known by various names. Nearby Winterthur Museum, formerly the residence of Henry Francis du Pont, contains a collection of American decorative arts from the seventeenth century through the early nineteenth century. Population 1970, 80,386.

Wilmington. The chief port of North Carolina, situated on the Cape Fear River, 20 miles from the Atlantic Ocean. Wilmington has an excellent harbor, accommodating large seagoing vessels, and is an important commercial city with an extensive shipping trade. The city is located in a highly productive agricultural district, of which it is the mercantile center. Wilmington has a number of textile mills for the manufacture of cotton goods, pile fabrics, hosiery, and wearing apparel. The city is the home of the U.S.S. North Carolina Battleship Memorial and the annual North Carolina Azalea Festival.

Wilmington was first settled in 1730 and incorporated in 1739. Here, in 1765, was the first armed resistance to the British Stamp Act. During the Civil War, the port was the chief gateway between the South and foreign nations. It was the principal resort of the blockade runners. It is the seat of Wilmington College. Population, 1970, 46,169.

Wilson, Mount. A peak in the Sierra Madre range of southern California, about 10 miles northeast of Pasadena. On its summit, which rises to an elevation of 5750 feet, is the Mount Wilson Observatory, containing the famous Hooker 100-inch reflecting telescope and other powerful instruments for astronomical research. An automobile road leads from Pasadena to the summit, which affords excellent views of the surrounding region.

Wind Cave National Park. Tom Bingham discovered Wind Cave in 1881 when he thought he felt wind blowing up from the ground and stopped to determine the source. The narrow entrance to the cave lets wind in when the outside pressure rises, and expels air when the pressure drops, creating a strong current of air and the illusion that the wind is blowing out of the ground. The cave was made a national park in 1903, and is located 12 miles northwest of Hot Springs in South Dakota. Its extensive galleries with many beautiful crystal formations are unusual because there are relatively few stalactites and stalagmites. There is a 44-square-mile game preserve surrounding the cave, with herds of bison, antelope, elk, and deer.

Winona. A city of southeastern Minnesota, situated on the Mississippi River, about 110 miles southeast of Minneapolis. A shipping point for agricultural products grown in the area, Winona is also important for limestone quarrying. Manufactures include sheet metal, glue, automotive equipment, and medicines. It is the seat of Winona State College, College of St. Teresa, and St. Mary's College. Population, 1970, 26,438.

Winston-Salem. A city of North Carolina, situated 108 miles west of Raleigh. It is located in a region noted for tobacco growing, and has become the most important center for the manufacture of tobacco in the United States. Its immense factories are said to turn out more manufactured tobacco products than those of any other city in the world. In value of manufactures, Winston-Salem outranks practically all other cities of the South. Other products include hosiery, underwear, air conditioning machinery, and furniture.

The business and industrial establishments are, for the most part, centered in Winston, while Salem is chiefly residential. The city is the seat of Wake Forest University, Salem College for young women and Winston-Salem State College. Salem was founded in 1766 by Moravians and long remained under the direct control of the Moravian Church. Winston was founded in 1849 and received its municipal charter in 1899. The two communities were consolidated in 1913. Population, 1970, 132,913.

Woodbridge. A large town of New Jersey, located 14 miles south of Newark, on the Arthur Kill, a channel separating New Jersey from Staten Island, New York. Rich clay deposits in the area supply the pottery, tile, and brick industry. Other industries include oil refining and the manufacture of chemicals, tools, and radio tubes. In the vicinity are the Bible Gardens, an outdoor museum of small replicas of the Holy Land's gardens and orchards as they were in Biblical times. Puritans from Massachusetts and New Hampshire settled the town in 1665. Woodbridge was incorporated in 1669. Population, 1970, 98,000 (est.).

Woods Hole. A village in Massachusetts within the town of Falmouth on Cape Cod. Formerly a whaling and shipbuilding center, the village is now widely known as the location of the Woods Hole Oceanographic Institution and Marine Biological Laboratories, which study tides, currents, and marine life.

Woonsocket. A city of Rhode Island, on the Blackstone River, about 16 miles northwest of Providence. The great waterfalls that gave Woonsocket its Indian name have been replaced by a huge dam with hydraulically operated gates as part of a $15 million flood-control system along the entire course of the Blackstone River. Textiles are the city's dominant industry, but other manufactures include plastics, rubber gear, canvas footwear, machine tools, and garments. Woonsocket is a consolidation of several factory villages, was chartered as a village in 1837, and incorporated as a city in 1888. Population, 1970, 46,820

Wooster. A city of northern Ohio, about 30 miles southwest of Akron. It is the trade center for a productive farm country, and is also important industrially, with manufactures ranging from paint brushes to truck bodies. It is the seat of the College of Wooster and the Ohio Agricultural Research and Development Center, which has 1900 acres used in experiments to improve and increase the world's plant and animal production. The city claims to have had the nation's first Christmas tree. Population, 1970, 18,703.

Worcester (*wo͝os'tẽr*). A city of Massachusetts, built on both banks of the Blackstone River, about 40 miles west of Boston. The city occupies a picturesque site covering the river valley and a number of the surrounding hills.

Worcester is preeminently a manufacturing city and is one of the greatest machine tool centers in the world. Among noteworthy manufacturing establishments are immense rolling mills, wire factories, envelope factories, and loom works. Other manufactures include aviation pressure suits, firearms, abrasives, paper products, athletic shoes, pharmaceuticals, and steam turbines.

The city ranks high among the cities of the state in general civic improvements. There are 17 public parks and many other recreation sites. Lake Quinsigamond forms part of the eastern boundary of the city.

Worcester is the seat of Clark University, College of the Holy Cross, Assumption College, Worcester Polytechnic Institute, and Massachusetts State College, Worcester. There is an excellent art museum; the library of the American Antiquarian Society, founded in 1812, is rich in historical material.

First settled in 1673, Worcester was twice abandoned because of the hostility of the Indians, especially during King Philip's War. It was incorporated in 1722 and was chartered as a city in 1848. Within the vicinity of Worcester were born Eli Whitney, inventor of the cotton gin; Erastus Bigelow, inventor of the carpet-weaving machine; Elias Howe, inventor of the sewing machine; Lucius Knowles, who perfected the modern power loom; and George Bancroft, the historian. Population, 1970, 176,572.

Wyandotte. A city of Michigan, 12 miles southwest of Detroit, of which it is a residential suburb. It is noted for its important chemical industry, which is largely based on the extensive salt beds that underlie the city. It was also important in the development of the steel industry in the U.S., having established the first steel analysis laboratory in 1862, and producing the first commercial Bessemer steel in the U.S. as early as 1864. Population, 1970, 41,061.

Wyandotte Cave. A natural formation in Crawford County, southern Indiana, five miles northeast of Leavenworth. Wyandotte Cave is the third largest cave in the U.S. after Carlsbad Cavern and Mammoth Cave and has a greater number and variety of stalactites and stalagmites than any other known cave in the U.S. Besides the numerous chambers and galleries, the 23 miles of the cave that have been explored contain Monument "mountain," rising 175 feet from the floor, and the Pillar of the Constitution, a large stalagmite 30 feet high and 75 feet in circumference.

Yakima (*yăk'ĭ-mȧ*). A city of central Washington, situated 142 miles southeast of Seattle. Yakima, formerly called North Yakima, is the commercial center of the Yakima Valley. This valley contains one of the largest areas of irrigated land in the western United States and is widely noted for the excellent apples and other fine fruits which it produces. The city's chief industrial establishments include fruit canneries, fruit packing houses, sugar, and lumber mills. Fort Simcoe is a nearby historical attraction. Population, 1970, 45,588.

Yellow Springs. A village of Ohio about 18 miles east of Dayton. It is noted as the seat of Antioch College, which operates on a cooperative plan of work and study. The Fels Research Institute and the Kettering Research Laboratory in Yellow Springs study human development. The village is also the seat of the national headquarters for the American Humanist Association. Population, 1970, 4624.

YELLOWSTONE NATIONAL PARK. The largest national park in the United States, situated mainly in northwestern Wyoming but encroaching slightly upon adjoining portions of Montana and Idaho. It is approximately 62 miles long and 54 miles wide, and covers an area of 3472 square miles. Of this area, 3200 square miles are in Wyoming, 236 square miles are in Montana, and 36 square miles are in Idaho.

Rivers and Lakes. Within the limits of the park are the headwaters of several large rivers, including the Yellowstone, the Snake, the Lewis, the Madison, and the Shoshone. The Continental Divide, passing through the park from southeast to northwest, marks the line of separation of the waters draining into the Atlantic from those flowing into the Pacific. There are also numerous lakes, the largest of which is Yellowstone Lake, some 20 miles long and from about 5 to 15 miles wide. Below timber line, the less precipitous mountains, as well as the more level portions of the park, are beautifully forested with pine, spruce, and other evergreen trees.

Surface and Origin. The central part of the park is essentially a high plateau, lying at an average elevation of about 8000 feet above sea level. Except on its southwestern border, this plateau is surrounded by massive, snow-capped mountains, whose culminating peaks and ridges rise from 2000 to 4000 feet above the enclosed tableland.

In its origin, the whole region is volcanic. Not only the encircling mountains but also the interior plains are made up of volcanic ash and lava, ejected in some former geologic age from far below the surface. Striking evidences of this are seen in the black glass of Obsidian cliff, in the contorted lavas along the road near the summit of Mount Washburn, and in the fused, highly colored sands composing the walls of Yellowstone Canyon.

Scenic Features. The entire park is a scenic wonderland. Its chief features are the geysers, which are the greatest in the world; the Grand Canyon of the Yellowstone, which, in beauty though not in size, rivals the Grand Canyon of the Colorado; Yellowstone Falls, ranking among the finest of American cataracts; and the remarkable fossil forests along the Lamar River.

Geysers. There are five active geyser basins—the Norris, the Upper, the Lower, the Heart Lake, and the Shoshone—all lying in the west and south central parts of the park. The numerous geysers in these various fields differ greatly in size, character, and action. Some, as, for example, Old Faithful, spout at nearly regular intervals, longer or shorter, while others are exceedingly irregular. Some burst upward to a great height, displaying immense power; others shoot tiny streams or bubble and foam while in eruption.

Hot Springs. Besides the geysers, there are marvelously colored hot springs, mud volcanoes, and other strange formations. At Mammoth Hot Springs, and also at Norris and at Thumb, the hot water has brought to the surface

immense quantities of white mineral deposits. These have built up high terraces containing beautifully incrusted basins, over the edges of which the hot water pours. Microscopic plants, growing on the edges and on the sides of these basins, color them with brilliant hues of pink, red, and bluish gray. The surface of many hot springs appears brilliantly colored, and the deeper pools in the terraces are often intensely green.

Grand Canyon and Falls. Because of the vivid coloration of its walls, in some places 2000 feet high, the Grand Canyon of the Yellowstone is a scenic feature of the first order. The colors vary from pearly white and pale lemon to orange, pink, and crimson. With the deep green of the forest above, these give a beautiful setting to the Yellowstone Falls, which are twice as high as Niagara. The view of the canyon and of the cataract is one of the most impressive in America.

Fossil Forests. The fossil forests along the Lamar River contain many petrified tree trunks which stand upright in the faces of nearly vertical cliffs that rise to a height of nearly 2000 feet above the valley floor. These petrified trunks are found at different depths, indicating a succession of forests, which, from time to time, have been overwhelmed, like Pompeii, with volcanic materials.

Animal Life. The park is a great wild-animal refuge or natural zoological garden. It contains protected herds of elk, moose, deer, antelope, and American bison. There are also numerous groups of brown, cinnamon, and grizzly bears, some of which have become remarkably tame and friendly. Yellowstone Lake and the other waters of the park abound in trout.

History. In 1806 John Colter, a member of the Lewis and Clark expedition, struck out on his own and in 1807 entered what is now Yellowstone National Park, thus becoming in all probability the first white man to see the region. The area was occasionally visited by hunters and trappers, and their reports of the fantastic sights, along with Colter's accounts, were regarded as pure imagination. Myth and legend grew around the bona fide reports, and the area was often derisively labeled "Colter's Hell." In 1870 the State of Montana organized an expedition, headed by Surveyor-General H. D. Washburn, to explore the area. His associate, N. P. Langford, wrote glowing descriptions of what they saw, confirming what had been regarded as fiction. In 1872 the American geologist Ferdinand Vandeveer Hayden surveyed the area and was influential in its establishment as a national park to guard against private exploitation of the area. In 1872 it became the world's first national park. Even after it became a national park, however, Yellowstone was unsafe for tourists. Indians raided and murdered visitors, hunters, trappers, and explorers. From 1886 to 1916 it was administered by the Army, with headquarters at Fort Yellowstone.

Accessibility. Yellowstone Park is reached by bus at Gardiner, Montana, on the north, and also at West Yellowstone, Montana, on the west. The eastern entrance to the park is reached by auto stage from Cody, Wyoming, 55 miles distant. The southern or Snake River entrance is reached by an auto road from the main north-and-south highway in Idaho. The southern entrance may be reached also by various auto routes.

Travel Facilities. Automobile roads and trails reach all the important features of the park. There are hotels, camps, stores, auto-transportation lines, and various other facilities and accommodations for travelers. The various park utilities are operated during the tourist season, which extends usually from June 20 to September 20.

Yonkers. A residential and manufacturing city of southeastern New York, on the Hudson River, 14 miles north of the center of New York City. It is situated along the east bank of the Hudson River, its site rising in a gradual slope to an elevation of 400 feet, from which may be obtained splendid views of the river and of the towering Palisades.

Of the many industries of Yonkers, the principal are the manufacture of machine shop products, elevators, drugs, clothing, wire and cable, and chemicals.

Yonkers was chartered as a city in 1872. Points of interest include the Philipse Manor House and Andrus Planetarium. Population, 1970, 204,370.

York. A town on the Atlantic coast of Maine, at the mouth of the York River, 40 miles southwest of Portland, in an area of cliffs, beaches, and pine groves. It is composed of several villages, including the well-known summer resorts of York Beach and York Harbor. One of the oldest communities in Maine, it was settled in 1624 under a grant from the Plymouth Company. It became the first English municipal corporation in America when it was chartered as a city in 1642 and named Gorgeana, after a member of the Plymouth Company, Sir Ferdinando Gorges. The city's name was changed to York in 1652. Frequently attacked by Indians, the community was almost annihilated in 1692. There are several buildings of historical note in the town, including the Old Gaol, one of the oldest in the U.S., and now a museum. Population, 1970, 5690.

York. A manufacturing and commercial center of southeastern Pennsylvania, 25 miles southeast of Harrisburg. York is situated in the midst of a highly productive agricultural district with which it conducts an extensive trade. Its chief industries are the manufacture of foundry and machine products and of bakers' machinery. Other manufactures include agricultural implements, safes and vaults, refrigeration machinery, silk goods, and hosiery.

York was first permanently settled in 1735 by a German colony. It was laid out in 1741 by the sons of William Penn, was incorporated in 1787, and received its city charter in 1887. In 1777–78, the Continental Congress held sessions in York while the British were occupying Philadelphia. Population, 1970, 50,335.

Yorktown. A village of southeastern Virginia, situated on an arm of Chesapeake Bay, about 70 miles southeast of Richmond. Yorktown is famous as the scene of the surrender, October 19, 1781, of the British army, by Lord Cornwallis. This virtually ended the Revolutionary War, and there is an impressive monument commemorating the event. The Yorktown battlefield area, reconstructed with fortifications and marked with explanatory signs, forms part of the Colonial national historical park. In 1862, General G. B. McClellan, with a large Union army, besieged the place and compelled its evacuation by the Confederate forces under General J. E. Johnston. On the principal street of the village stands the oldest customhouse in the United States. Population, 1960, 311.

YOSEMITE (*yō-sĕm′ĭ-tē*) **NATIONAL PARK.** A national park, containing some of the most magnificent scenery in America. It lies immediately west of the summit of the Sierra Nevada, in central California, about 160 miles east of San Francisco.

Area and Surface. The park occupies a mountainous tract, some 50 miles long, north and south, with an extreme width, east and west, of about 35 miles, the whole embracing an area of 1189 square miles. This region, in general, slopes to the west, and is traversed by two main rivers, the Merced and the Tuolumne, and by their numerous tributaries.

The surface varies from deep valley floors on the west, which lie at an elevation of less than 4000 feet above the sea, to snow-capped peaks which tower to heights of 13,000 feet, along the eastern boundary. Extensive areas are covered with noble forests of immense evergreen trees. These are interspersed with charming mountain meadows and many beautiful lakes. There are innumerable canyons, gorges, and narrow valleys, with rushing streams, cascades, and cataracts, fed, in large part, from the glaciers and snow fields on the higher mountains.

The surface features that give to the park its most striking character were mainly formed by glacial action and by river erosion. These natural agencies, working through long periods of geological time, have produced the deepest valleys and the highest waterfalls on the continent.

Scenic Features. Like Yellowstone Park, the Yosemite region presents a long succession of scenic wonders. The chief of these are included in the celebrated Yosemite Valley, in the Tuolumne Canyon with the Hetch Hetchy, and in the famous Mariposa grove of "big trees."

Yosemite Valley. This incomparable valley is about 7 miles long, with an average width of about a mile. Through the bottom of this valley, the Merced River flows. On either side, the valley is bordered with a succession of vast cliffs and lofty granite domes which rise almost vertically to immense heights. Among the most noted of these massive rock formations, with the heights of their summits above the valley floor, are: Cathedral Rocks, 2591 feet; El Capitan, 3604 feet; Sentinel Dome, 4157 feet; Half Dome, 4892 feet; and Clouds Rest, 5964 feet.

Waterfalls. Over the edges of towering precipices in the rock walls that enclose the Yosemite Valley plunge some of the most remarkable cataracts known. The Upper Yosemite Falls drop 1430 feet in one sheer descent. Immediately below, the stream cascades through a drop of 620 feet, known as the Middle Yosemite Falls, and then takes a drop of 320 feet over the Lower Yosemite Falls. These three falls, which are parts of one great cataract, make a drop of 2370 feet, equal to 14 Niagaras, before their waters reach the Merced River. Bridal Veil Falls has a drop of 620 feet; Vernal Falls, 320 feet; Illouette Falls, 370 feet; and Nevada Falls, 594 feet. The Ribbon Falls, the highest of all, drops 1612 feet sheer, a straight fall about ten times as great as that of Niagara. Nowhere else in the world is there such an array of stupendous waterfalls.

TUOLUMNE VALLEY. With the opening of roads and trails, making this region of the park accessible, the fine scenic features of the Tuolumne basin are also becoming celebrated. These include the beautiful Hetch Hetchy Valley, the Grand Canyon of the Tuolumne, and the remarkable Waterwheel Falls, in which enormous arcs of water are flung from 50 to 80 feet into the air.

BIG TREES. The greatest grove of giant sequoias outside of Sequoia National Park is the Mariposa grove in the southern area of Yosemite Park. The monster tree of this grove is the Grizzly Giant, whose girth is 93 feet, whose diameter is 29½ feet, and whose height is 204 feet. In massiveness, this immense tree is exceeded only by the General Sherman tree, 36½ feet in diameter and 280 feet high, in Sequoia National Park, and by the General Grant tree, 35 feet in diameter and 264 feet high, in General Grant National Park. Other noted trees in the Mariposa grove are the Washington tree, slightly smaller than the Grizzly Giant; the Columbia tree, 294 feet high; and the Wawona tree, through whose trunk ran an automobile road 26 feet wide until the tree fell in 1968. There are two minor sequoia groves in the park—the Merced and the Tuolumne.

HISTORY. The Yosemite National Park region was once the stronghold of the Awani, or Yosemite (Grizzly Bear), Indians. The first white men to see it were probably Captain Joseph R. Walker's party, who came to the area in 1833. In 1851 a band of militia, the Mariposa Battalion, led by James D. Savage, entered Yosemite seeking retribution for Indian raids, and tried to drive out Chief Tenaya. James Hutchings led the first tourist party through Yosemite and later used his publication, the *California Magazine*, to encourage others to come to see the beautiful Yosemite valley. In 1864 an act of Congress set aside the valley and Mariposa Grove of Big Trees to be administered by California. John Muir, noted American naturalist, lived here in 1868–74 and helped to establish it as a national park. In 1890 a national park was created around the Yosemite Grant, as the section ceded to California in 1864 was called, and in 1906, California returned this grant to the Federal Government as a part of Yosemite National Park.

ACCESSIBILITY. Yosemite Park is reached by bus and car through El Portal, near the western boundary of the park, and thence into Yosemite Valley. The park is reached also from Merced by auto stage to Mariposa and Wawona, thence to the Mariposa grove of "big trees," and into Yosemite Valley. It may be reached by auto roads from various other points.

TRAVEL FACILITIES. Automobile roads and trails have been built to the chief places of interest. There are hotels, camps, stores, auto-transportation lines, saddle horses, camping and hiking equipment, and various other facilities and accommodations for travelers. Yosemite Valley is always open. The higher mountain roads usually are not open until early June.

Youngstown. A city of northeastern Ohio, on the Mahoning River, about 65 miles southeast of Cleveland. Youngstown owes its importance as a steel manufacturing center to its advantageous situation near necessary raw materials and to excellent transportation facilities. In the vicinity are coal mines and limestone quarries. Iron ore from Minnesota is available with a short haul from lake ports.

The city's chief industrial establishments are its immense blast furnaces, steel works, and rolling mills. Other manufactures include many subsidiary steel products, such as sheets, pipes, and engine boilers; also tin plate, coke, fireproofing, rubber goods, and electrical machinery. The Youngstown district produces about one-sixth of the pig iron and about one-eighth of all the steel made in the United States. The city has 2633 acres in public parks, including the beautiful Mill Creek Park, covering 2383 acres. Among the public buildings of especial note are the Stambaugh Memorial Auditorium and the Butler Art Institute.

Youngstown was settled in 1796, was incorporated in 1848, and received its city charter in 1867. A blast furnace was built in 1805 and a rolling mill was erected in 1845. Population, 1970, 139,788.

Ypsilanti. A city of Michigan, situated on the Huron River, 28 miles west of Detroit. It is the commercial center of a fertile agricultural region. Primary among its manufactures are automobiles and automobile parts. The site was established as a French fur-trading post in 1809, and as a permanent settlement in 1823. It was named for Alexander and Demetrios Ypsilanti, leaders of the Greek war for independence, which was raging at the time. Ypsilanti is the seat of Eastern Michigan University and Cleary College. Population, 1970, 29,538.

Yuma. A city of southwestern Arizona, built on the east bank of the Colorado River, at the mouth of the Gila, about 7 miles from the Mexican boundary. The surrounding region is remarkable for its almost continuous sunshine and for the extreme dryness of its climate. The annual rainfall of 3.13 inches at Yuma is the lowest recorded at any station of the United States weather bureau. Summer temperatures of 110° to 120° in the shade are recorded. Yet, owing to the low humidity, sunstroke is practically unknown. Yuma was established in 1700 by Spanish missionaries. It is the trade center of a district in which large quantities of alfalfa seed and other irrigated field crops and fruits are produced the year round because of the uniformly warm climate. Yuma is a popular winter resort and the site of the Yuma Indian Reservation and Vincent Air Force Base. Population, 1970, 29,007.

Zanesville. A city in Ohio, located on the Muskingum River at the mouth of the Licking, 58 miles east of Columbus. The Muskingum River is here spanned by a "Y" bridge, branches going to both sides of the Licking River. Zanesville occupies an attractive site, surrounded by lofty hills. Its varied industries include the manufacture of pottery, glass, tiles, electrical transformers, steel, cement, and barrels.

Zanesville was founded in 1797 by Ebenezer Zane and others, and, during 1810–12, it was the capital of the state. It was incorporated in 1814 and was chartered as a city in 1850. Population, 1970, 33,045.

ZION NATIONAL PARK. A national park, 230 square miles in area, containing picturesque mountains, bizarre rock formations, and a long, narrow canyon three-fourths of a mile deep.

HISTORY. It is evident from the remains of cliff dwellings in and near Zion National Park that it was inhabited long before the white man arrived. Nephi Johnson, a young Mormon missionary and interpreter for the Paiute Indians, the native inhabitants of the area, was probably the first white man to view the area extensively. The reports of Captain John C. Fremont, who explored the Southwest in 1843–44, influenced some Mormon pioneers to come to the area in 1847. They settled around the Virgin River and named the region Zion, "the heavenly city of God."

The park area, located in southwestern Utah, was set aside in 1909 as Mukuntuweap National Monument. It was enlarged and renamed Zion in 1918, and became a national park in 1919. It was enlarged in 1956 by the addition of the adjoining Kolob Canyon area. The name Zion was first given to the canyon by Mormon settlers in 1850, and many natural features of the area bear names reminiscent of the Mormon faith.

FEATURES. The North Fork of the Virgin River, flowing from north to south, has cut through mountains a narrow gorge eight miles long whose sides rise 2500 to 3500 feet above the bed. The rocky walls are vermilion at the bottom and white at the top, exhibiting a geological history of the rise and fall of the land over a period of 15 million years. A road runs along the bed to a northern observation point 6508 feet high, from which one may see mountains called the Temple of Sinawava, Cathedral, and Majestic, among others. Other high mountains in the park are the Sentinel (7157 feet) and East Temple (7110 feet). The highest point is West Temple (7795 feet). Utah Route 15 passes east and west through the park beside Clear Creek, passing through a mile-long tunnel. To the north of this road is the Great Arch, carved out by millennia of erosion by water and wind.

The park is open throughout the year, and the highways are kept free of snow. There are some 155 miles of trails.

Zuñi (*zōō′nyē*; *sōō′-*). The largest of the Pueblo Indian villages, situated near the western boundary of New Mexico, about 40 miles south of Gallup. The inhabitants, who possess a distinct language, call themselves Ashiwi. They are descendants of the people of "Cibola," mentioned by the earliest Spanish explorers.

Like Pueblo Indians generally, the Zuni people are peace-loving, devoted chiefly to agriculture, and adhere with great tenacity to their ancient culture and customs. In the construction of their adobe and stone houses, in their methods of irrigation and agriculture, in weaving, in jewelry, in pottery making, and in other arts, as well as in their elaborate ceremonials, they closely resemble the other village-dwelling Indians of the Southwest.

The Zuñi people were first visited by the Spaniards under Coronado in 1540. Later, Spanish missionaries gained considerable influence with them. Population, 1970, 3958.

CANADA

Canada is a completely sovereign or independent state and member nation of the Commonwealth of Nations.

Size. Canada, having an area of 3,852,000 square miles, covers a surface nearly as large as Europe and larger than the United States, excluding Alaska. The country measures from east to west at its widest extent more than 3000 miles and from north to south about 1600 miles. A number of islands, which are territory of the state, lie off the northeastern coast. The most northerly island extends to a latitude of 85° N. A large inland sea, connected with the north Atlantic Ocean by Hudson strait, extends into the country from the northeast a distance of about 600 miles. Canada's southern boundary follows the 49th parallel of latitude from the western coast eastward to the Lake of the Woods. Inclining slightly southward to Lake Superior, it passes through the Great Lakes and part of the Saint Lawrence river, which it leaves at the 45th parallel. It then runs with an irregular course eastward to the Atlantic Ocean.

Topography. Canada may be divided into five natural divisions, based on the character of the land surface. These divisions are commonly called (1) the Acadian or Appalachian region, (2) the Canadian shield or Laurentian plateau, (3) the Saint Lawrence lowlands, (4) the great plains, and (5) the Cordilleran region.

1. The Acadian or Appalachian region embraces southeastern Quebec and the maritime provinces. This region is the extension into Canada of the Appalachian mountains of the United States.

2. The Canadian shield or Laurentian plateau is a huge V-shaped area of 2½ million square miles, which encloses Hudson bay at its center. It forms practically all of northern Canada, and covers the area lying northeast of a line drawn from the Mackenzie River delta to the Lake of the Woods and northwest of a line which passes thence north of the Saint Lawrence River basin. Its southern and Atlantic borders are elevated and outwardly steep, forming the Laurentian mountains. From this outer rim its surface slopes gradually to its low center, Hudson bay. The western portion inclines similarly from an elevated rim toward Hudson bay and the Arctic Ocean. In detail, the surface of the plateau is often broken and rocky with innumerable lakes.

3. The Saint Lawrence lowlands, which run from Lake Huron down the Saint Lawrence valley between the Laurentian plateau and the Acadian highlands, are a northeasterly extension of the central plain of North America drained by the Mississippi valley.

4. The great plains form a northern extension of the topographical division which occupies all North America within the limits of the Appalachian mountains, the Canadian shield, and the Rocky mountains. At the international boundary line, this division has a width of 800 miles, but becomes narrower farther north. For 300 miles north of the boundary the region is prairie, but beyond this latitude it is forested. In the southern portion, traversed by the railway lines, three prairie steppes are clearly marked: an eastern steppe, the basin of the Red river, lying between the Canadian shield and the Manitoba escarpment and having an elevation of 800 feet above the sea; a central steppe, between this escarpment and the Missouri coteau, with an elevation of from 1600 feet in the east to about 2500 feet in the west; and a western steppe, rising to a height of 3000 or 4000 feet, which extends from the Missouri coteau to the Rockies.

5. The Cordilleran region, about 500 miles broad, is made up of a succession of mountain ranges running parallel to the Pacific coast and of the well marked longitudinal valleys which separate the ranges. In the south, where the mountains have been adequately explored, the district falls into three subdivisions: (1) an eastern group of mountain systems, consisting of the Rocky mountains, the Selkirk system, and the Columbian mountains, or Gold ranges; (2) the interior plateaus; (3) the coastal mountains, consisting of the Coast range and the Vancouver range, the latter being in places submerged. In the south the Rocky mountains are the highest, but in the north the coastal mountains far exceed them. Mount Logan, in the St. Elias range, Yukon, 19,850 feet elevation, is the highest point in Canada.

Climate. Canada covers so many degrees of latitude and possesses such vast areas of highland and lowland that it has many varieties of climate.

(1) Based on the revised standard industrial classification and new establishment of total activity concepts. Using earlier classification, figures would be 6.7% lower. (2) Nonmetallic minerals. (3) Based on new series; includes power produced by industrial establishments for their own use. (4) Includes re-exports of 140 million for 1961 and 255 million for 1966. (5) Exclusive of fodder corn. (6) 1939; military restrictions prevented publication of detailed figures for copper, lead, and nickel after 1939.(7)1940. (8) Includes bushel equivalent of wheat flour. (9) 1959. (10) Minerals and metals. (11) Year ended March 31, 1967, DDB statistics. (12) 1962. *Not available; new classifications were instituted in January 1961 for exports and in Jan. 1964 for imports. †Expenditure for new stock. Source (main): *Canada Year Book* (annual editions).

Over the larger part of the country, especially over the great interior plain, a continental climate prevails, the temperature in Fort Simpson, for example, varying from a recorded minimum of 73° below zero to 101° above. In other sections, however, the extremes of heat and cold are modified by the presence of vast bodies of water, as the Atlantic Ocean, the Pacific Ocean, the Great Lakes, and Hudson Bay.

In the maritime provinces, spring is retarded by the presence of the cold arctic current on the Atlantic Coast. The summer climate, however, is equable and the autumn is long and open. British Columbia has one of the finest climates in North America. At New Westminster the mean temperature of the coldest month is 36° F. and that of the hottest is 58° F. The lowest recorded temperature of Vancouver is only 2° lower than that of San Antonio, Texas. The recorded rainfall reaches a higher figure on the Pacific Coast than in any other part of Canada. The region of the Great Lakes has a temperate climate with a fairly high precipitation. The interior plains have a comparatively dry climate, but fortunately the precipitation occurs mainly in the summer, when it can be of value for agriculture.

Waterways. The rivers of Canada are of exceptional magnitude and number. They belong to four large drainage basins: (1) the Atlantic, including the Saint John, the Saint Lawrence and its tributaries, and the Hamilton; (2) the Hudson Bay, including the Moose, the Albany, the Nelson and its tributary,—the Saskatchewan,—the Churchill, and many others; (3) the Arctic, including the Banks, the Coppermine, and the Mackenzie with its tributaries—the Liard, the Peace, and the Athabaska; (4) the Pacific, including the Columbia, the Fraser, the Skeena, the Stikine, and the Yukon, the last emptying into Bering Sea.

Rimming the outer border of the Laurentian plateau are the greatest lakes of the world, the lakes of the Saint Lawrence system—Lake Ontario, Lake Erie, Lake Huron, and Lake Superior. Other large lakes of Canada are Lake Winnipeg, Lake Athabaska, Great Slave Lake, and Great Bear Lake.

The Great Lakes system is the waterway of the most importance for transportation, although the Nelson-Saskatchewan river, flowing into Hudson Bay, and the Mackenzie-Athabaska river, flowing into the Arctic Ocean, were well traveled water highways known to fur traders long before settlements had advanced as far west as Lake Ontario.

By means of enlarging the channel of the Saint Lawrence River, the Canadian government has made it possible for ocean steamers to reach Montreal, which is situated at a distance of 700 miles from the Atlantic Ocean. By the further construction of 117.2 miles of canals, an uninterrupted communication by water has been established from the head of Lake Superior to the Atlantic Ocean, an aggregate distance of 1594 miles.

Minerals. Canada is the world's chief source of nickel, platinum and the platinum metals, and asbestos; it ranks second in gold, aluminum, and zinc, and fourth in copper and lead.

The chief minerals of the maritime provinces are coal and iron, mined mostly in Nova Scotia. These provinces also produce gypsum in large amounts.

Canada's nickel, gold, and cobalt come mainly from northern Ontario, where platinum, copper, and silver also represent a large proportion of Ontario's annual output of minerals. Oil, natural gas, and salt are produced in southern Ontario. Quebec is one of the world's chief sources of asbestos. Other minerals produced in Quebec are mica, copper, gold, building stone, and clay for bricks.

The prairie provinces, particularly Alberta, have large coal deposits. Alberta also produces oil and natural gas in important quantities. From Manitoba come gold and copper.

The mineral output of British Columbia comprises chiefly copper, coal, gold, silver, lead, and zinc. Yukon territory has long been famous for its gold and silver mines. Important discoveries of silver, cobalt, and radium ore deposits were made in 1931 in the Northwest Territories, northeast of Great Bear Lake, and the first shipments of radium ore were made in 1932 for reduction in Port Hope, Ont.

Flora. In Ontario and Quebec, south of a line running from Georgian Bay to Montreal, the flora is of a southern forest type. North of this line to latitude 50°, from the Gulf of Saint Lawrence to Manitoba, a Temperate Zone forest type prevails. In Manitoba the forest disappears, giving place to the prairie grasses and herbage. Prairie vegetation spreads west as far as the foothills of the Rockies. Farther north, along a line drawn from latitude 55° on the Athabaska river to the south end of Lake Winnipeg, the prairie gradually gives place to the northern forest.

This northern forest belt extends from the Atlantic Ocean and the Gulf of Saint Lawrence to the Rockies. It covers all the country, extending from the temperate forest and the prairies northward as far as the Barren Grounds. In its southern half, this area is densely forested, but in the northern half the forest gradually becomes more open and the trees become smaller. The line between the forest and the Barren Grounds runs from Richards Island in the Arctic Ocean to the general region of Churchill on Hudson Bay, and from Richmond Gulf on the east side of the bay to Ungava Bay. In the Barren Grounds, the subsoil is permanently frozen.

In the Cordilleran belt, the flora varies according to climatic conditions. It is characterized by a tropical luxuriance on the coast and on the western slopes of the high ranges, but, in the dry areas east of the ranges, it takes on forms typical of the American desert.

Forests and Lumbering. Canada's forests cover 1,151,454 square miles, nearly one-third of the country's total surface. They are included more or less roughly in three areas: (1) the giant fir forest of the Rocky Mountains and the Pacific Coast; (2) the northern coniferous forest, lying between the prairies and the Barren Grounds; and (3) the deciduous, hardwood forest, extending from Lake Huron through southern Ontario and southern Quebec to New Brunswick and the Atlantic Coast.

The chief timber trees of the Pacific Coast area are Douglas fir, red cedar, Alaska pine, Sitka spruce, and Engelmann spruce. The dominant types of the northern forest include white spruce, balsam fir, tamarack, and black spruce. The more valuable trees of the southeastern forest area are yellow birch, white pine, red pine, eastern cedar, maple, elm, ash, oak, and hickory.

The forests of Canada are owned mainly by the provincial governments. Leases are extended to lumber or pulp companies to cut the timber, usually with the condition that the logs be sawed or manufactured into pulp in Canada.

The products of the forest which represent the largest value are pulp wood, lumber, and firewood. A large part of the lumber and pulp wood or paper manufactured from pulp wood is exported to the United States.

Fauna. The fauna of Canada resembles that of northern Europe. The carnivora are represented by several species of the weasel family, such as the ermine, the marten, and the mink. The lynx, bear, fox, wolf, and skunk are common at a distance from the settled districts. In the prairie provinces, small rodents, called gophers, are so numerous as to constitute a pest. The beaver is a characteristic Canadian animal and has been adopted, along with the maple leaf, as a national emblem. Otters and muskrats are numerous. Caribou range over the northern plains, which are also the habitat of the unique musk ox, an animal almost as large as the domesticated ox but having a close resemblance to the sheep. Moose and deer are found in the forested areas, and goats, sheep, and grizzly bears make the

mountains their habitat. White bears, seals, and walruses are common along the northern coasts. Snakes are rare except in the extreme south.

Fur-bearing Animals. The animals which provide the largest aggregate value in pelts are the fox, muskrat, beaver, mink, ermine, and marten. Approximately one-fifth of all Canadian furs come from fur farms. The silver fox is the animal most successfully raised in captivity, but many fur farms are stocked with minks, raccoons, skunks, martens, coyotes, and badgers.

The fur trade constituted Canada's earliest commercial interest. It was formerly a monopoly of the Hudson's Bay Company, which controlled most of the northwest region until 1859. The company still has the largest share of Canada's fur trade, maintaining posts throughout the vast territory of the north.

Fisheries. Canada's sea fishing waters, including bays and inlets, total over 200,000 square miles. Conservation methods to protect the country's immensely valuable fishing industry have been adopted both by the Federal government and by provincial governments. It is officially estimated that the government hatcheries plant annually in suitable waters about two billion fish fry.

Salmon are taken on the Pacific coast; lobsters are obtained from the shore waters of the maritime provinces and of Quebec. Herrings are caught both on the Atlantic coast and on the Pacific coast. Hake, pollock, mackerel, and paddock are products of Atlantic deep-sea fishing. Halibut were formerly plentiful in Atlantic waters, but they now come mostly from the Pacific coast. British Columbia and New Brunswick have developed sardine canning industries. In the Pacific Coast waters, are found the eulachon, or candlefish. Smelts are also abundant there as well as along the shores of the maritime provinces. Alaska black cod is highly prized but is not plentiful.

Prince Edward Island Malpeque oysters were formerly famous for size and quality, but the beds have been greatly depleted as a result of overfishing and of disease. Clams are found on the coasts of both oceans. Large quantities of fresh-water fishes are taken, such as perch, bass, pickerel, pike, tullibee, and whitefish, the last constituting the most valuable food fish obtained from the Great Lakes.

Agriculture. Agricultural land in Canada lies directly north of the American border in a strip extending east and west across the country with a width of several hundred miles. The fertile portion of this strip is interrupted by a large rocky territory in northern Ontario and by the mountains of British Columbia, where cultivation is confined mainly to the valleys. The total area of land under field crops is about 62,000,000 acres, although approximately six times this area is said to be of value for agriculture.

In the maritime provinces, fruit and potatoes are the most important cash crops, although hay, clover, and oats command the largest acreage. Farming in Quebec is mixed and largely self-contained; potatoes and buckwheat are the leading cash crops. Ontario supports dairy farming chiefly in the east; wheat, apples, tobacco, and sugar beets are the principal cash crops in the south; and the Niagara region specializes in the cultivation of peaches, grapes, cherries, and other fruits. The prairie provinces raise the bulk of Canada's wheat crop, which reached a high point of 567 million bushels in 1928. Canada leads the world in wheat exports, and its wheat production is exceeded only by those of Russia and the United States. British Columbia cultivates fruits intensively and raises poultry and cattle.

Livestock. Stock raising is still an exclusive occupation in some parts of Alberta, Saskatchewan, and British Columbia, but elsewhere it is made a part of mixed farming. Specialization in stock raising, just as in grain growing, is being superseded by mixed farming. This change, however, has resulted in an increase rather than in a decrease of the number of live stock raised.

Dairying is an important industry, Canada being one of the largest exporters of cheese in the world. The factory system has been adopted in all the provinces. Experimental farms distributed across the continent are maintained by the government.

Manufacturing. Industrial development has proceeded rapidly in Canada during recent years, partly as a result of the increased availability of cheap hydroelectric power. This expansion has been largely confined to the older provinces. Ontario ranks highest in manufacturing, Quebec comes next, and British Columbia takes the third place. Montreal heads the list of industrial cities with Toronto a close second, Hamilton, Windsor, and Vancouver following in the order named. The industrial output exhibits a wide variety of products, the most important of which is newsprint paper, in the production of which Canada leads the world. Flour manufacture, meat packing, sawmill operations, and automobile and textile manufacture follow. Canada is one of the largest manufacturers of rubber products in the world.

Water Power. The water power available in Canada is enormously extensive, the total available for electric generation being estimated at 33,113,200 horse power at ordinary 6 months flow. Over 80 per cent of all power used in Canada is in the form of electricity, and of this over 98 per cent is generated by water power. This situation is due chiefly to the fact that water power is available close to the centers of population. In the use of electricity Canada is exceeded only by the United States; in its use per capita, Canada leads the world.

Transportation. There are in Canada over 40,000 miles of railroad in operation, of which the government owns more than 20,000 miles. Two transcontinental systems span the country from east to west.

Roads and highways in Canada open to traffic in 1953 had a total mileage of 512,795, of which 181,306 miles were classified as improved highways. They include the Trans-Canada highway, 4860 miles in length, said to be the longest highway in the world. Opened in 1962, it connects all ten provinces of Canada. From its eastern terminus at St. John's, it traverses 500 miles in Newfoundland, utilizes a ferry to Cape Breton Is., N.S., crosses the world's deepest causeway at the Canso Strait into Nova Scotia, and is joined by a ferry-served feeder section from Prince Edward Island. It proceeds through Ottawa, Winnipeg, Calgary, Rogers pass in the Rocky Mountains, and, via ferry to Vancouver island, finds its western terminus at Victoria, B.C.

Shipping. The principal seaports of Canada include Montreal, Vancouver, Victoria, Halifax, Saint John, Sydney, and Quebec. The countries with which Canada has the heaviest sea-borne commerce are the United States, Australia, and Great Britain. The shipping on the Great Lakes is heavy, traffic being mainly of grain, lumber, and ores passing east and of coal and manufactures going west. See *St. Lawrence Seaway*.

Population and Language. More than one-half of the population of Canada is of British descent; about one-third is composed of the descendants of French colonists. In the prairie provinces large numbers of Americans have settled as well as a certain proportion of people from continental Europe. The majority of the latter, however, live in the industrial centers. There are more than 100,000 American Indians, mostly on reserves. The population in 1971 was estimated at 21,681,000.

French shares with English the status of an official language in Canada. Its use is confined mainly to

SCENIC CANADA

Percé Rock, an offshore bird sanctuary in Quebec's fishing region, is 1500 ft. long, 288 ft. high, and pierced by a 60-ft. central arch.

View of the city of Quebec, capital of the Province of Quebec (*Quebec Province Tourist Branch & Film Bureau*)

A primitive wooden bridge in rural Canada. About 600 of these structures, covered for protection from the weather, still survive.

Sainte Rose du Nord, a village on the shore of the Saguenay River. Supported by fishing and forestry, it was settled about 1860.

Canadian Government Scenes: Quebec. The Citadel rises 350 feet above Quebec—the only fortified city in North America. Controlling the St. Lawrence waterway, it was built between 1823 and 1832, and was the site of wartime conferences in 1943 and 1944 between Churchill and Roosevelt. Below: In a colorful ceremony the Guard is changed. Garrisoned by the Royal 22nd Regiment, the fortress is the official Quebec residence of Canada's Governor General. (*Quebec Department of Tourism*)

Canadian Parliament, Ottawa—Winter view of the Parliament through the iron tracery of the central gate. The three Gothic-style buildings stand on a promontory over the Ottawa River. The original center building was designed mainly by Thomas Fuller. Begun in 1860, the group was completed in 1865. In 1916 the center was swept by fire, but rebuilt by 1920. The central Peace Tower, with a carillon of 53 bells, is 291 feet high, patterned after the famous Big Ben clock-tower of Britain's Parliament. The center section contains the Senate Chamber, House of Commons, and government offices. (*Canadian Dominion Bureau of Statistics*)

GEOGRAPHY AND TRAVEL

The Rhine, one of Europe's most famed rivers in history and legend, rises among the Swiss Alps and falls some 7000 feet. (*German National Tourist Office*)

Versailles Palace, a national museum near Paris, built by Louis XIV. The city is the capital of the Seine-et-Oise Department. (*French Govt. Tourist Office*)

Maligne Lake, in Jasper National Park (largest in North America—4200 square miles), a region of majestic peaks, canyons, lakes, icefields, and hot springs. Located in the Canadian Rockies, the park was established in 1907 as a wildlife sanctuary. (*Canadian Government Travel Bureau*)

The Dome of the Rock, site of Solomon's Temple in Jerusalem, dates from A.D. 687. It is believed that it was built by Omar, second Moslem Caliph. By tradition, it is the place where the Hebrew patriarch Abraham prepared to sacrifice his son Isaac. (*Courtesy Robert Bartels*)

Quebec and to a few French settlements in other provinces.

Education. The education of Indian and Eskimo children of school age is a responsibility of the Federal government; the provincial governments are responsible for exercising all other education. Elementary and secondary education is free and compulsory to age 14. As the need for qualified tradesmen, technicians, and professionals has increased, numerous vocational schools and community colleges have come into existence, making nearly 400 institutions of higher education in Canada in 1968. In the same year, more than 3,000,000 adults were enrolled in the large adult education program.

PROVINCES

Canada is divided into ten organized provinces, Yukon Territory, and the Northwest Territories comprising the districts of Franklin, Keewatin, and Mackenzie. The provinces, enumerated from east to west, are Newfoundland, Nova Scotia, Prince Edward Island, New Brunswick, Quebec, Ontario, Manitoba, Saskatchewan, Alberta, and British Columbia.

Alberta. A province of Canada, situated between British Columbia on the west and Saskatchewan on the east and stretching from the American border about 750 miles north to the 60th parallel of north latitude. The southwestern border follows the summit of the Rocky mountains, thereby leaving in Alberta the western mountain slope and the foothills. From the foothills in the southern portion of the province, a plain slopes eastward, forming a part of the Saskatchewan River basin. The northern part of the province consists of a plain of northern drainage, belonging to the Mackenzie-Athabaska basin. A fringe on the extreme south drains into the Missouri river. The elevation varies from 12,294 feet on the top of Mount Columbia in the Rocky mountains to 568 feet at Slave river in the north. Except in the south, Alberta is well watered by numerous rivers, large and small. Lakes abound in the central and northern parts. The area of the province is 255,285 square miles.

The climate of Alberta is continental, involving great extremes of temperature. The air is dry and healthful. In southern Alberta the chinook winds, descending from the ridge of the Rocky mountains, often clear the ground rapidly of snow in the early spring, thus reviving the grasses which serve as sustenance for large herds of cattle.

A dark mold, mostly humus, overlying a clay subsoil, covers the surface of Alberta from six inches to several feet in depth. Such a soil, being exceedingly fertile and at the same time capable of retaining a large amount of moisture, supports a highly developed agricultural industry. Wheat and oats are the principal crops. Mixed farming has tended in recent years to replace specialized grain growing, with the result that potatoes, dairy products, flax, sheep, hogs, and poultry contribute a considerable amount to the total of the agricultural production.

In the southwest of the province, there is an area which requires irrigation in order to insure crops. Over 5400 miles of irrigation canals and ditches have been constructed.

The mineral resources of Alberta are of considerable importance. Immense areas of lignite and of a high grade bituminous coal have been discovered. Anthracite coal is also mined. The output of all kinds of coal amounts normally to over six million tons, a total exceeded by none of the other provinces. Petroleum and natural gas have been found both in the northern and in the southern part.

The capital and largest city of Alberta is Edmonton, in which is located the University of Alberta, supported by the province. The chief industries are those related to agriculture, such as meat packing. Population, 1971, 1,628,000.

British Columbia. The most western province of Canada, extending from the international boundary line to latitude 60°. The province is bounded on the east by Alberta; the western boundary is the Pacific Ocean, for a distance of 500 miles, and, for an additional 600 miles, the province borders on the coast strip of Alaska. British Columbia includes Vancouver island, the Queen Charlotte islands, and numerous other islands off the Pacific coast. The area is 366,255 square miles.

With the exception of a portion of the Peace River country in the northeast, the whole of British Columbia lies within the Cordilleran mountainous belt. The highest point is Mount Fairweather, 15,300 feet. Between the ranges, and occasionally cutting through them, are deep fertile valleys. Between the coastal mountains and the next important range to the east is an interior plateau having much agricultural or grazing land.

A submergence of the coast has resulted in an archipelago of innumerable islands, deep sounds, and fiords, many of them excellent harbors. As a result, the province has a coast line of 7000 miles. Of the rivers, the Fraser, 800 miles long, is the largest. The Columbia river rises in British Columbia and has a course of 500 miles before crossing the boundary line. Beautiful fiordlike lakes are a feature of many of the valleys. The islands and the coast region have a mild climate, rainy in winter but dry in summer. The interior plateaus are dry and subject to greater extremes of temperature.

British Columbia has one of the greatest forests of merchantable timber in North America, besides

Name	Location	Area Sq. Miles	Established	Distinctive Characteristics
Scenic and Recreational Parks:				
Banff	Alberta	2,564	1885	Ideal mountain playground containing the two famous resorts, Banff and Lake Louise.
Cape Breton Highlands	Nova Scotia	390	1936	Northern part of Cape Breton island; rugged coast line with mountain background.
Fundy	New Brunswick	80	1948	Recreational area. Forested region, wildlife sanctuary, rugged terrain.
Georgian Bay Islands	Ontario	5.37	1929	Thirty islands in Georgian bay, scene of bloody inter-tribal Indian war in 1649; includes Flowerpot Island reserve.
Glacier	British Columbia	521	1886	Summit of the Selkirks; Illecillewaet and Asulkan glaciers; Nakimu caves; Marion lake; Rogers and Baloo passes.
Jasper	Northern Alberta	4,200	1907	Immense mountain wilderness; unclimbed peaks, glaciers, snow fields, canyons, lakes; Mt. Edith Cavell, Miette Hot Springs, Mt. Robson.
Kootenay	British Columbia	543	1920	Mountain scenery, Briscoe range, Ice lake, Sinclair canyon, and Radium Hot Springs.
Mount Revelstoke	British Columbia	100	1914	Panoramic views of Columbia and Illecillewaet valleys, Clach-na-Coodin ice field.
Point Pelee	Lake Erie, Ontario	6	1918	Most southerly point in Canada; resting place of many migratory birds; recreational area; unique flora.
Prince Albert	Saskatchewan	1,496	1927	Recreational reserve and wild life sanctuary.
Prince Edward Island Shore	North Shore, P.E.I.	7	1937	Twenty-five mile strip of bathing beaches.
Riding Mountain	Western Manitoba	1,148	1929	Rolling wooded hills. Abundance of large game.
Saint Lawrence Islands	Ontario	189.4*	1914	Thirteen islands and one mainland reservation among the Thousand Islands.
Tar Sands Reservation	N. Alberta	3.2	1926	Four areas reserved for National Parks Branch to supply materials for road building.
Waterton Lakes	Southern Alberta	204	1895	With adjoining U. S. Glacier park forms international park. Mountains noted for beauty of coloring; lovely lakes, waterfalls, and snow peaks; excellent trout fishing; favorite camping resort.
Yoho	British Columbia	507	1886	Rugged scenery of west slope of Rockies; Yoho valley with falls over 1200 feet in height; natural bridge; Emerald lake.
Animal Parks and Reserves:				
Buffalo	Near Wainwright, Alberta	197.5	1908	Government's buffalo herd—over 3000 buffalo also moose, elk, deer, yak, and catalo.
Elk Island	Near Lamont, Alberta	75	1913	Smaller fenced enclosure, containing about 2000 buffalo; also moose, elk, and deer.
Nemiskam antelope Reserve	Southern Alberta	8.5	1922	Fenced reserve containing about 300 prong-horned antelope.
Wood Buffalo	Alberta and N. W. T.	17,300	1922	Home of the wood buffalo.
Historic Parks: Fort Anne	Nova Scotia	31*	1917	Fort Annapolis Royal was the center of the struggle between France and England for the possession of the continent.
Fort Beauséjour	New Brunswick	81*	1926	Site of a fort built by the French in 1750-51.

* Acres.

millions of acres of pulp wood yet untouched. Douglas fir, cedar, spruce, western hemlock, larch, and pine attain an unusual diameter and height. Logs 30 feet in girth are not uncommon. In value of output lumbering ranks highest among the industries of the province, providing support for two-fifths of the population and entitling British Columbia to the first place among the lumber producing provinces.

In the fishing industry, British Columbia likewise ranks first among the provinces, supplying 47 per cent of the Canadian production. The salmon fisheries are the most important, and have given rise to a large salmon canning industry. Halibut, herring, and black cod form a considerable part of the annual catch.

The discovery of gold in 1858 in the Fraser River district was the occasion for the earliest settlements in British Columbia. The mineral production since that time has continued to be important, copper, gold, coal, and silver being among the more valuable products of the industry. Nearly all the lead produced in Canada comes from British Columbia, which has one of the greatest lead-zinc deposits in the world. The province mines about one-fourth of the country's mineral output by value.

In recent years agriculture, fruit growing, stock raising, dairying, and poultry raising have made rapid advances. The chief fruits include apples, grapes, peaches, apricots, plums, strawberries, and cherries.

British Columbia has a native supply of coal and of iron, and the province is favorably situated for shipping goods to the markets of Australia, of South America, and of Asia. Mainly as a result of these facts, manufacturing has become important, entitling British Columbia to the third place in regard to industrial output among the provinces.

The public school system is nonsectarian. In-

struction must be given in English. The provincial university, called the University of British Columbia, is situated at Vancouver, which is the largest city of the province. The capital is Victoria, on Vancouver Island. Population, 1971, 2,190,000.

Keewatin (*kē-wä'tĭn*), **Mackenzie, Franklin.** Three divisions, each known as a provisional district, formed on January 1, 1920, out of the vast Northwest Territories. The total area of these districts is 1,309,682 square miles, of which 1,258,217 square miles are land and 51,465 square miles are water. In 1966, the population numbered 28,738.

The land is a rolling plain. The principal lakes are Great Bear lake and Great Slave lake, both in Mackenzie; the largest river, the Mackenzie, flows for most of its course through that district, emptying into Mackenzie bay, an arm of the Arctic Ocean. Furs are obtained in all the districts, and minerals—radium, gold, copper, lead, zinc, petroleum, and coal—have been found.

Manitoba (*măn'ĭ-tō'bä*). A province of Canada, situated in the south central part of the country between Ontario and Saskatchewan, stretching about 750 miles northward from the American border to 60° north latitude. The eastern boundary follows the 95th meridian about 275 miles northward, then cuts across at an angle of about 45° to Hudson Bay, so that the northeastern part of the province has a coast line on the bay. In the southern part, the drainage is from the southeast and the west to Lake Manitoba and Lake Winnipeg and thence northeast by the Nelson River to Hudson Bay. In the north, the Churchill River basin drains eastward into Hudson Bay. Duck mountain, 2727 feet in altitude, is the highest point. The area of the province is 251,832 square miles.

A large part of the soil is alluvial, a vast lake having occupied the southern part of the province in geological times. This alluvium, a black loam of great fertility, has a very high content of potash, nitrogen, and phosphoric acid, and is, therefore, peculiarly well adapted to the growth of cereals. The southeastern part of the province is rocky and slopes rapidly from the highlands of northern Ontario. This fact has made possible the development, on the Winnipeg River, of extensive hydroelectric power.

The chief primary industry of Manitoba is agriculture. The growing season has a duration of from 85 to 105 days. This period, however, by reason of the long, bright summer days, is sufficient to ripen a hard type of spring wheat which holds a position in the world's markets second to none. Oats, barley, and potatoes are grown also in considerable quantities. The dairy products of Manitoba are important and a great deal of butter and cheese are shipped. Cattle and swine are raised.

Manufacturing in Manitoba has been promoted by the availability of cheap hydroelectric power. In the value of industrial output, the province normally ranks fourth.

The capital and largest city of Manitoba is Winnipeg, which is also the seat of the University of Manitoba. The first permanent settlement was made in 1812 in the Red River district by a company of Scotch colonists. A unique feature of Manitoba's winter life is the annual dog derby, a race in which various dog teams compete on a course some 200 miles in length. Population, 1971, 985,000.

New Brunswick. A maritime province in the southeastern part of Canada, having an eastern coast line on the Gulf of Saint Lawrence and a southeastern coast line on the Bay of Fundy. Maine lies to the southwest of the province, and Quebec, to the northwest. The total coast line is 500 miles long and is indented with many fine harbors. Most of the surface is a rolling plain, lying between the low hills which, in the south, skirt the Bay of Fundy and the subdued mountains of the northwest. The highest point is Carleton mountain, which reaches an altitude of 2716 feet. The area is 27,985 square miles.

A number of navigable rivers traverse the province: the Saint John flows southward into the Bay of Fundy; the Mirimichi and Restigouche follow an eastward course into the Gulf of Saint Lawrence. At Grand Falls on the Saint John River is the spectacular 225-foot cataract which, now harnessed, supplies power for a large hydroelectric plant. At the river's mouth in Saint John Harbor is the famous "reversing falls" which, lighted at night, is an impressive sight.

New Brunswick's climate is subject to extremes. The thermometer has ranged from 95° F. in summer to −30° F. in winter.

Agriculture is the leading industry. The principal crops are hay, potatoes, oats, and turnips. Orcharding is important, apples forming the most valuable item. There are numerous cheese factories and creameries. Most of their products are exported to England. The province has much fertile land which has not yet been occupied.

Forests cover a large part of New Brunswick. Lumbering is an important industry, entitling the province to the fourth place in the nation in regard to lumber production. Spruce, pine, fir, maple, hemlock, birch, beech, ash, and elm are among the principal timber trees. At present, spruce is the principal commercial wood and is exported in large quantities.

New Brunswick ranks third among the provinces in the fishing industry. Oysters, lobsters, herring, codfish, haddock, and smelts are caught. The canning of lobsters and oysters and the curing of codfish add greatly to its economy.

The principal manufactured products include lumber, woodenware, wood pulp, boots and shoes, paper, cottons and woolens, nails, mill machinery, and leather. Fredericton is the capital. Saint John, the largest city, is an ice-free harbor at which two transcontinental railways reach tidewater. Population, 1971, 629,000.

Newfoundland. A former British dominion, consisting of the island of Newfoundland, lying across the mouth of the Gulf of Saint Lawrence, and a portion of the Labrador peninsula. Being situated 1640 miles west of Ireland, Newfoundland commands the shortest route from North America to Europe.

The island has an area of 42,734 square miles. In form it resembles a triangle with approximately equal sides of about 325 miles in length. The coasts are, in general, high and rocky, indented by innumerable fiords. Newfoundland's Labrador territory covers about 232,400 square miles, covering the land draining into the Atlantic. Of this, 112,400 square miles came to Newfoundland in 1927 through the favorable outcome of a boundary dispute. Its value lies in the coast fisheries, in pulpwood, and in potential hydroelectric development.

The interior of Newfoundland is a rolling plain, interrupted by a few isolated peaks and rising on the northwest to a ridge of hills, called Long range. From this ridge eastward flows Exploits River, the country's longest stream. The Humber River has cut its way westward through Long range and flows into the Gulf of Saint Lawrence. The rivers are not navigable.

The climate is subject to less extreme variations of temperature than those occurring in any part of the interior of Canada. The mean temperature is lowered by the proximity of the arctic current, which brings melting icebergs from the north and occasions dense fogs along the coasts.

Large portions of the island consist of marshes and of rocky soil supporting lichens and low shrubs of pine and of larch. The river valleys, however, contain large tracts of arable land and extensive areas heavily forested with conifers, birch, and red maple. The wild animals include the black bear, the wolf, the beaver, the deer, and the fox. The Newfoundland dog was developed by a cross between European species and a woolly-coated dog used by the Indians of Labrador.

Source: Statistics Canada, preliminary 1971. [1] 1966.

Approximately one-fifth of Newfoundland's population is engaged in fishing and curing codfish. Nearly half the exports are codfish products.

The most important manufactures are pulp and paper. A very small fraction of the arable land is cultivated, in spite of the steps taken by the government to encourage agriculture. The chief crops are potatoes and turnips. Iron, zinc, and copper are mined.

The population of Newfoundland in the 1971 census was 523,000, concentrated mainly in the coast region of the southeast. This figure excludes 5,000 inhabitants of Labrador, mostly Indians. Nearly all the inhabitants are of British descent and Protestants. The schools are denominational.

The government has been undergoing changes since 1934, when the British government suspended the constitution and took over on account of internal financial difficulties. Union with Canada as a tenth province was carried by a small majority in a referendum conducted in Newfoundland July 1948, and was mutually agreed to in December of that year. Canadian and British parliaments and the Newfoundland government ratified this agreement, which came into force March 31, 1949. The population of St. John's, the capital, fishing, industrial, and educational center, in 1971 was 86,290.

Nova Scotia. A maritime province in the extreme southeast of Canada, consisting of a narrow peninsula and of the Island of Cape Breton, which was connected with the mainland by a large rail-highway causeway completed in 1955. The greatest length is 350 miles and the greatest breadth, 100 miles. The maximum elevation of 1500 feet is reached at North Cape plateau, Victoria County. The area of the province is 21,428 square miles.

The main peninsula is a long highland cut by transverse valleys. An important longitudinal valley, the Annapolis valley, runs parallel to the Bay of Fundy, being separated from it by a narrow ridge known as North mountain. The seacoast line is 1500 miles in length, and is indented by several inlets which form excellent harbors.

Bras d'Or lake in Cape Breton is a magnificent landlocked body of salt water. It has become a popular resort for wealthy summer residents. Minas basin, the east arm of the Bay of Fundy, penetrates 60 miles inland. Here the tides, rising some 50 feet, rush in with great force, forming "bores."

Nova Scotia has a healthful climate, with a mean summer temperature of 65° F. and a mean winter temperature of 25° F. Winter weather is variable, and spring is late.

Agriculture is the chief occupation, hay, potatoes, turnips, and oats constituting the principal crops. Fruit growing, dairying, and stock raising are important.

Coal is mined extensively in Cape Breton island and in the northern part of the mainland. Copper tungsten, lead, gold, and manganese are found, and there are enormous beds of iron ore. Gypsum occurs in immense masses. Nova Scotia normally ranks fourth among the provinces in mineral output.

The fisheries of Nova Scotia are among the most productive in the world. The annual value is second only to that of British Columbia, among the Canadian provinces. Mackerel, cod, herring, had-

dock, and lobsters abound in the coast waters. Lobster canning has become a large industry.

Products manufactured in the province include iron and steel products, cotton and woolen goods, boots and shoes, machinery, farm implements, furniture, paper, sugar, condensed milk, and vehicles. Wood pulp is exported. Lumbering, formerly the chief industry, is still important.

The province is well supplied with railroads, chiefly lines of the Canadian National Railway. Shipping is important, especially in winter, when navigation on the Saint Lawrence is closed. There are three universities. The capital and largest city is Halifax. Population, 1971, 770,000.

Ontario. The most populous and most wealthy province of Canada. It is situated in the southeast of Canada, between Quebec and Manitoba and between the international boundary and Hudson Bay. The province consists of a large northern area joined to a smaller but populous southern area by a narrow neck between Georgian Bay and the Quebec border. The southern portion is part of the Saint Lawrence lowlands, belonging to the Saint Lawrence River basin. This basin is separated by a flat and ill-marked watershed, called the height of land, from the Laurentian plateau, which is an area of southern drainage sloping toward Hudson Bay. The bulk of the population is to be found in the lowlands, where the soil is adapted to agriculture. The northern country is rocky. Tiptop Hill, 2120 feet high, in Thunder Bay district, is the highest point in Ontario. The province is well watered by lakes and rivers. The area is 412,582 square miles.

Since Ontario extends from Hudson Bay to Lake Erie, a distance of about 1000 miles, there is considerable climatic variation. Extreme cold in winter is experienced about the watershed. The southern part, however, has a much milder climate, while the climatic severity of the northern section is tempered by the lowness of its altitude.

In value of mineral production, Ontario leads all the other provinces. The chief products mined are gold, silver, nickel, copper, cobalt, platinum, lead, iron, and arsenic. Nickel and cobalt are distinctive of Ontario's mineral output. Nickel is produced in no other part of the world in similar quantities.

Farming is the most important primary industry. In value of field crops, Ontario usually ranks second among the provinces. The land under cultivation is almost entirely in the lowlands, although agriculture is practicable in parts of the Laurentian plateau, including the clay belt in northern Ontario, through which the Canadian National railway has been constructed. Oats, wheat, barley, and corn are the chief grains. Minor crops are peas, rye, sugar beets, tobacco, potatoes, and turnips. About half the fruit raised in Canada is produced by Ontario. Approximately one million barrels of apples of the high grade are annually shipped to Europe. Similarly, in the output of dairy products and in the number of live stock owned, the province holds the leading position.

In lumbering, Ontario yields the first place to British Columbia, and, in the production of pulp wood, the province ranks third to Quebec. Immense forests cover almost one-fourth of the area of the province. Spruce, pine, and poplar are the principal woods cut, although maple, birch, and elm are also found over considerable areas. Oak and hickory occur in the more southern parts.

The Great Lakes fisheries employ hundreds of vessels. Trout, whitefish, pickerel, and fresh-water herring form most of the catch, a part of which is canned for market.

Ontario is Canada's most highly developed industrial section, manufacturing industries supporting nearly one-half the population. Hydroelectric power is available in large quantities due mainly to the development of the water power of Niagara Falls. The manufactures of the province include machinery, electrical equipment, automobiles, rubber products, farm implements, ironware, railroad rolling stock, metals and alloys, leather, furniture, paper, soap, boots and shoes, sewing machines, woodenware, and textiles. Milling, fruit canning, and meat packing employ many thousands of hands.

Ontario has seven universities, besides a number of church and technical colleges and agricultural schools. The province was formerly called Upper Canada. Its population was considerably augmented by the United Empire Loyalists. The capital and largest city is Toronto. The province also contains Ottawa, the capital of the country. Population, 1971, 7,795,000.

Prince Edward Island. An island province of Canada, situated in the southern part of the Gulf of Saint Lawrence. Prince Edward Island is the smallest and most densely populated province of the nation. The island is about 145 miles long and varies in width from 5 miles to 34 miles. The coast line is a succession of bays and headlands. The surface is gently rolling, the greatest height being 306 feet, at Fredericton Station, Queens County. The area is 2184 square miles.

Due to the influence of the surrounding sea, the province is singularly free from extremes of heat and cold. Fogs are less frequent than on the mainland. The soil is fertile and produces, besides other crops, hay, potatoes, oats, and turnips.

The fisheries provide employment for a large part of the population. Lobsters and oysters of superior quality are canned for market. Cod, herring, hake, and mackerel are also taken.

Dairying receives much attention, and the island's creameries and cheese factories export large quantities of their products. Rivaling it in importance is the production of poultry and eggs. In recent years, silver fox farming has developed into a highly important industry.

Prince Edward Island attracts many summer residents by its pleasant summer climate and its facilities for surf bathing. Higher education is furnished by two colleges. Charlottetown, the capital, is the largest city. Population, 1971, 111,000.

Quebec. A province in eastern Canada, lying between the Gulf of Saint Lawrence on the east and Hudson Bay and Ontario on the west and extending north about 1200 miles from the international boundary to Hudson strait and the Atlantic coastal strip known as Labrador. Quebec is the oldest as well as the largest province in the country and was formerly known as Lower Canada. Its area is 594,434 square miles.

Except for a narrow strip along the Saint Lawrence River, the whole northern part of the province belongs to the Canadian shield with a drainage toward Hudson Bay. To the south of the river rise the Notre Dame Mountains, a continuation of the Appalachian system. Mount Jacques Cartier, on the Gaspe Peninsula, is the highest point in Quebec, with an altitude of 4230 feet.

The climate of Quebec is continental in severity, partly on account of the influence of cold arctic currents and of winds blowing above them and passing over the land. The air is dry, clear, and bracing.

The mining industry of Quebec is confined mainly to the eastern townships and to the district along the Ottawa River. Asbestos is a distinctive product, Quebec supplying over half of the world's market. Other products are copper, gold, chromic iron, cement, magnesite, mica, graphite, apatite, marble, serpentine, roofing slates, and building stone.

The lumber industry has always been of great importance in Quebec, which contains millions of acres covered with commercial timber. The lumber and the pulp industry yield approximately the same returns as in Ontario.

Agriculture and dairying form the chief occupations. The principal crops are hay, oats, and potatoes. Quebec is a close second to Ontario in the production of creamery butter and of factory cheese. Cattle are exported to Europe. The making of maple sirup and of maple sugar centers in this province.

The seacoast fisheries yield cod, mackerel, and lobsters as the principal items of the catch. Large amounts of salt fish are exported.

Quebec ranks second to Ontario as a manufacturing province. Wood pulp, timber products, machinery, cottons and woolens, aluminum, refined sugar, leather, and boots and shoes are included among the principal manufactures. Hydroelectric power installations exceed in horsepower those of any other province. Among the largest plants and ranking among the greatest in the world are those at Arvida near Lake St. John, at Gouin Dam on the St. Maurice River, near Quebec, and at the Beauharnois Dam, near Montreal.

Elementary instruction is free. Catholics and Protestants have separate schools. There are four universities in the province and several agricultural, technical, and trade schools. The capital is Quebec. The largest city is Montreal, which is also one of the largest wheat shipping ports of the world, in spite of the fact that it is icebound during the winter.

Most of the people are descendants of early French settlers, and in most of the rural districts French is the language in common use. Roman Catholicism is the predominant religion. Population, 1971, 6,030,000.

Saskatchewan (*săs-kăch'ĕ-wŏn*). A province of Canada, situated in the south central part of the country between Manitoba and Alberta and extending from the international boundary about 750 miles north to latitude 60° N. The southern half belongs to the great central plains region; the northern portion is part of the Laurentian plateau. South of the North Saskatchewan and of the Saskatchewan River, the surface is prairie, but north of these rivers the province is heavily forested with spruce, pine, tamarack, poplar, and birch. The eastern portion of the prairie belongs to the second prairie steppe; the western section forms a part of the third steppe, which angles across the province and stretches in rolling plains through Alberta to the Rocky Mountains. On the plains, the soil is a rich loam. Excepting for the southwestern section, the province is well watered with rivers and lakes, which are especially numerous in the Laurentian area, in the northern and central parts. The surface covers 251,700 square miles.

On account of Saskatchewan's great length, there is a considerable diversity of climate and of temperature. The southern third has a moderate and changeable climate. The western portion of this section is dry, being subject to the warm chinook winds, and requires irrigation; the eastern part has more moisture and a steadier winter. The central third has a steady winter and a greater precipitation. The climate of the northern region is of a continental severity.

Agriculture is the great, almost the exclusive, industry of Saskatchewan. In point of wheat production in Canada, the province holds the first place. Its fields are free from rust and from insect pests which attack wheat. In the production of oats, Saskatchewan normally ranks first or near the first among the provinces. Mixed farming is increasing in the south. In the north, too, cattle raising is gradually giving place to mixed farming. Dairying is encouraged by the government, especially through the improvement of breeds of stock. Agricultural products are marketed by means of more than 6000 miles of railway, which have been constructed in the province. A government experimental farm, with headquarters at Indian Head, has performed valuable services in the agricultural development of Saskatchewan.

The capital and largest city is Regina. Other important cities are Moosejaw, Prince Albert, and Saskatoon, the last-mentioned city being the seat of the University of Saskatchewan. Population, 1971, 927,000.

Yukon. A territory in the northwest of Canada between British Columbia and the Arctic Ocean. Ranges of the Rocky Mountain system traverse the northeastern portion of the territory, and are separated by the Yukon River basin from the Coast range and the Saint Elias range in the southwest. The Yukon River basin is a plateau country with a general slope toward the northwest. In the extreme southwest, Mt. Logan, the highest peak in Canada, reaches an elevation of 19,850 feet. The area of the territory is 207,076 square miles.

Mining is the principal occupation, gold and silver being the chief products. From 1895 to 1931 the value of the gold output was $211 million. The annual yield has greatly diminished, causing a decline in population from 27,219 in 1901 to 4157 in 1921. The development of a rich silver district later caused a fresh influx of settlers, but the inhabitants numbered only 17,000 in 1971.

A railroad connects Whitehorse, the capital of the territory, on the upper Yukon with Skagway in Alaska. Some of the hardier crops, as barley, oats, rye, potatoes, and turnips, are grown, and, in sheltered valleys, peas, cabbages, lettuce, and other garden vegetables thrive. Dawson, in the west central section, is the center of the Klondike gold region.

TWENTY LARGE CITIES OF CANADA

Showing Growth 1891-1971

CITIES, TOWNS, AND OTHER POINTS OF INTEREST

The following section contains articles on some cities of Canada having a population in excess of 25,000. It includes also descriptions of the capital cities of the country and of all the provinces. Since Canada is scenically one of the most attractive countries of the world and draws annually many hundreds of thousands of travelers, many of the places especially worth visiting are described. These include Banff in the Rocky Mountains and Muskoka in Ontario. A number of other places are included for special interest attaching to them, such as the famous shrine center at Sainte Anne de Beaupré and Churchill, the sub-arctic port.

Banff. A health and pleasure resort of southwestern Alberta, picturesquely situated in Banff National Park on the eastern mountain slope. It has a boiling sulphur spring and is the point of departure for numerous scenic features in the vicinity, including Bow Falls, many rocks of unusual formation, and glacier fed lakes. The most beautiful of the lakes is Lake Louise, enclosed by gigantic pine-clad mountains. Lying about a thousand feet above Lake Louise are Lake Agnes and Mirror Lake. Banff itself was the first national park in America, an area of five square miles dedicated in 1885 but since enlarged to over 250 square miles. The town's permanent population is engaged almost exclusively in the tourist trade, the summer visitors numbering over 15,000 a day. Local attractions include the Canadian wax gallery and an annual four-day celebration of "Banff Indian days." The town is governed by a federal park superintendent, but a locally elected council serves in an advisory capacity. Population, 1971, 3,608.

Brandon. A commercial and railway city of southwestern Manitoba, the second largest city in the province. Industries are based primarily on agriculture, including meat and vegetable packing and manufacture of dairy products and fertilizers. Situated 130 miles west of Winnipeg, it is the trade center for Western Manitoba and part of Saskatchewan. Other industries include oil refining and the manufacture of electrical equipment. Brandon College is affiliated with McMaster University in Hamilton, Ont. A Dominion experimental farm and an Indian residential school are located in the vicinity. Population, 1971, 30,832.

Brantford. A manufacturing city on the Grand River in southern Ontario. Its leading manufactures are agricultural implements, binder twine, refrigeration units, and truck bodies. The city is named for the Mohawk chief, Joseph Brant, for whom a beautiful monument has been erected. His body is buried beside Queen Anne's Chapel of the Mohawks, built in 1785. Alexander Graham Bell resided at Brantford when he first demonstrated his telephone in 1874. A handsome monument to his memory stands in Victoria Park, and his homestead is preserved as a public museum. Population, 1971, 62,853.

Calgary. A commercial and manufacturing city of southern Alberta at the junction of the Bow and Elbow rivers. It is the gateway to Banff and the Canadian Rockies, 77 miles distant.

Calgary, incorporated as a town in 1884 and as a city in 1893, owed its early growth to cattle marketing and meat packing. Irrigation of the farm lands to the east brought other industries based on agriculture. The discovery of oil in 1914 and of rich gas fields in 1948 made it a magnet for a wide variety of industries and accelerated its growth. Situated along the east side of the city, these include oil refining and the manufacture of petrochemicals, fertilizers, farm machinery, rubber products, and oil-well equipment. Shops of the Canadian Pacific Railway are located in the city.

Calgary's leading educational institution is the University of Alberta, Calgary. Its 110-acre exhibition ground features an annual stampede and provides sporting and art facilities. There is a 400-acre recreation area known as Happy Valley. Among the more imposing buildings is the Provincial Jubilee Auditorium, a center for concerts and art exhibitions. Population, 1971, 400,154.

Charlottetown. The capital of Prince Edward Island, occupying a high site at the head of Hillsborough Bay at the junction of three tidal rivers. The city has an excellent harbor. The fisheries are extensive. Manufacturing interests include frozen-food processing, meat and poultry packing, iron and brass founding, metal fabricating, and manufacture of industrial and special machinery, concrete and stone products, and chemical fertilizers. Charlottetown has two colleges and several fine public buildings, including the Fathers of Confederation Memorial Centre.

The city was founded in 1756 by French settlers but passed to Great Britain with the cession of Canada in 1763. Two American privateers raided the town in 1775; but the property seized was returned, and the prisoners were restored to their homes by order of General Washington. Charlottetown was incorporated in 1855. Population, 1971, 18,631.

Churchill. A port of northern Manitoba on Hudson Bay. The first commercial shipments of wheat were made through this port in 1932. A railroad connects this point with Winnipeg, and large grain elevators and port facilities have been constructed. By using the route through Hudson Bay during its open season of three or four months, shippers between Western Canadian points and Liverpool same 600 miles over the route via Montreal. Population, 1971, 1,612.

Cobalt. A mining town of Ontario, situated near Lake Timiskaming on the upper Ottawa River. Cobalt was the center of one of the richest silver producing regions in the world. The deposit was discovered in 1903, and production reached its peak in 1911, with shipment of 31,507,791 ounces of silver. In the 1930's the town went into a sharp decline although the district continued to produce a large proportion of the world's cobalt, with nickel and arsenic as by-products. Population, 1971, 2,191.

Dawson. Former capital of Yukon Territory, located in the west central part of the territory on the Yukon River just below the Klondike. At the height of the Klondike's gold-mining prosperity, Dawson had a population of over 20,000; but, when the rich claims in the district were worked out, the number of inhabitants decreased greatly. The name commemorates Dr. G. M. Dawson, the geologist, who first reported on the gold prospects of the district. Population, 1971, 745.

Edmonton. The capital of Alberta, a trading, manufacturing, and oil production center. It occupies a picturesque site on the North Saskatchewan River, which is here spanned by six bridges, one of them 200 feet above the river.

A fur trading station and fort was founded on the site in 1795. In 1891, when a railroad line reached it from Calgary, the population was 400, which was temporarily swollen to 3000 as the starting point of the Klondike gold rush. It became Alberta's capital in 1906, and settlers poured in as the surrounding rich agricultural lands were occupied. Coal mines attracted industries, chiefly those related to agriculture and lumbering.

The discovery of oil nearby in 1947 brought a period of spectacular growth. Edmonton found itself the center of the richest oil and gas field in Canada, and gas was piped to points as far away as Ontario. A mushrooming chemical industry grew up, followed by satellite secondary industries.

The city is regularly laid out with wide streets crossing at right angles. In the early 1960's work was begun on a civic center, its focal point being the strikingly modern city hall. Other structures include the ultra modern Centennial public library, an art gallery, and the Chateau Lacombe hotel. In one of the city's 86 parks is a planetarium, the first to be constructed in Canada. Other imposing buildings are the Parliament Buildings and the buildings on the 300-acre campus of the University of Alberta. Population, 1971, 434,116.

Fort William. A transshipping point and flour milling city of northwestern Ontario, situated on Thunder Bay in Lake Superior at the head of Canadian navigation in the Great Lakes. It is the Great Lakes terminal of Canada's Lake Superior, Canada's western terminus of the St. Lawrence Seaway. It is contiguous with its sister city, Port Arthur, the two being popularly known as the Canadian Lakehead Cities. The economy of both is based on their location, the point where the grain from the prairie provinces is loaded on ships. Although ice-bound for six months a year, the port's tonnage ranks with the largest in Canada. It has a grain storage capacity of 110 million bushels. Its industries include pulp and paper milling and shipbuilding.

The cities' water supply comes from Loch Lomond, a nearby lake 320 feet above the city situated behind Mt. McKay. Eighteen miles to the west is the magnificent Kakabeka Falls, where the water of the Kaministikwia River falls 128 feet into a rocky gorge. In 1966, the population of Fort William was 48,208; that of Port Arthur was 48,340.

Fredericton. The capital of New Brunswick, situated in the southwest part of the province at the head of navigation for large ships in the Saint John River, about 84 miles from its mouth. The leading industries include the manu-

facture of lumber, machine shop products, and shoes.

Fredericton is the seat of the University of New Brunswick, in whose organization the first step was taken in 1785 on petition of the first settlers, United Empire Loyalists driven from the United States. Several of its buildings were erected through the benefaction of Lord Beaverbrook, whose earliest years were spent in New Brunswick and who became a publisher and peer in England. He donated also the Beaverbrook Art Gallery and the Playhouse, the latter opened in 1964.

Fredericton was incorporated in 1845. Its Parliament buildings, old and impressive, are supplemented by the Centennial Building of ultra-modern construction in the downtown area, which houses most government departments. Population, 1971, 23,612.

Halifax. The capital of Nova Scotia, located on a natural harbor at the center of the southeast coast of the province. Halifax is an important naval base, an ice-free port, and the winter terminus of several steamship lines. The Canadian National railways also use the city as their eastern terminus. The steamship and railway terminal facilities are among the finest on the continent.

The chief interests of Halifax include transportation and shipping, fisheries, and manufacturing. The foreign trade of the port normally approximates $140 million in value. Fish cured in the city are extensively exported to the West Indies and to South America. The leading industries are car shop production, sugar refining, and the manufacture of textiles, furniture, cordage, and foundry products.

The northwest arm of the harbor is used as a pleasure resort by citizens of Halifax. The educational institutions include Dalhousie University, King's College, Technical College, Mt. St. Vincent University, and St. Mary's University. The city was founded by Lord Cornwallis in 1749 under orders to create a bastion to offset France's Port Royal. In 1917, a collision of two ships in the harbor, one loaded with ammunition, caused an explosion that destroyed the north part of the city, killing 1158 persons and injuring 4000 others. Population, 1971, 121,086.

Hamilton. A manufacturing and railroad city and lake port of southern Ontario, the fifth largest city of Canada. It is situated on Burlington Bay, a land locked harbor at the extreme western end of Lake Ontario. The Niagara escarpment, a height of land passing through the south of the city, imparts a picturesque effect which is further enhanced by the presence of numerous shade trees. The greater part of the city lies in the plain between the waterfront and the escarpment, known locally as the mountain.

Numerous railroads and highways enable the city to profit by its central location in the most populous region of Canada with electric power abundant and cheap. The St. Lawrence Seaway makes it an ocean port, whose tonnage places it among Canada's largest shipping centers. It is the center of Canada's steel industry. Other important industrial products include electrical equipment, farm implements, glass, and textiles. Canning is also an important industry.

The city has numerous parks, the finest being Dundurn, which contains a historic castle and is equipped for "sound and light" productions. Other parks include Victoria, with its famed Royal Botanical Garden; Confederation park with beach areas on Lake Ontario; and Cherokee Winter Sports park. The educational institutions include McMaster University, Ontario Teachers College, and Institute of Technology. There is also a fine art gallery. Hamilton was incorporated as a city in 1846. Population, 1971, 307,473.

Hull. A lumber and manufacturing city of southwestern Quebec, on the Ottawa River opposite the city of Ottawa, with which Hull is connected by three bridges. Pulp wood, matches, paper, lumber, cement, and knitted goods are the chief items of manufacture. The city was incorporated in 1875. Population, 1971, 62,842.

Kingston. A city of Ontario, situated at the northeastern extremity of Lake Ontario, where the waters of the lake enter the Saint Lawrence river. The city's manufactures include locomotives, textiles, and leather goods. A natural harbor and excellent railway facilities make Kingston an important point for the transshipping of grain. The Rideau canal connects the city with Ottawa.

Kingston is the seat of Queen's University and of the Royal Military College. The university buildings on a beautiful campus, the Roman Catholic and the Anglican cathedral, the streets adorned with numerous shade trees, and several parks make Kingston an attractive city. Numerous limestone buildings give a distinctive character to the architecture. The historic associations of the city are emphasized by the elaborate fortifications, including the fort and martello towers, which command the harbor.

Kingston was founded in 1673 by Frontenac and La Salle and formed one of the chief French centers of authority and trade with the West. It became the center of loyalist settlements in the West after the Revolutionary War. It was a British naval and military base, until the treaty by which the United States and Great Britain abolished naval establishments on the lakes. From 1841 to 1844 Kingston was the capital of the United Provinces of Upper and Lower Canada. Population, 1971, 61,870.

Kitchener. A prosperous manufacturing city in Waterloo County, southern Ontario. The chief manufactures include automobile tires, shoes, and meat products. Kitchener was incorporated as the village of Berlin in 1854. Its earliest inhabitants were Mennonites who left Pennsylvania shortly after the Revolutionary War. Their German origin and frugal, industrious habits left a lasting impression on the population. Made a city in 1912, it changed its name to Kitchener in 1916.

Among the city's features are the Memorial Auditorium, used for exhibitions, sports, and theatrical productions; Doon, a pioneer village; and the Homer Watson Memorial Park. Adjacent to Kitchener on the north is the city of Waterloo, an insurance center and the seat of Waterloo University. The population of Kitchener in 1971 was 109,954; that of Waterloo was 37,245.

Klondike. A gold mining district in the Yukon Territory near the center of the Alaskan boundary. It covers an area of about 800 square miles. The principal settlement became notable for the discovery of gold there in 1896, since which time it has yielded about $211 million worth of the metal.

London. A commercial, manufacturing, educational, and ecclesiastical center of southwestern Ontario. London is situated midway between Toronto and Detroit in a rich agricultural district. The chief industrial interests include printing, electrical apparatus, hosiery, sheet metal products, machinery, chemicals, and cereals. London is also a financial center. It is the seat of the University of Western Ontario and has two cathedrals, Anglican and Catholic. London was founded in 1826 and was incorporated as a city in 1855. Population, 1971, 221,430.

Moncton. A manufacturing, railroad, and lumbering city of southeastern New Brunswick, standing at the head of navigation on the Petitcodiac River. Moncton is the headquarters for the Atlantic division of the Canadian National railways. It has a large lumber trade and manufactures stoves, engines, and boilers. Moncton has three parks, from one of which, Bore View Park, may be obtained an excellent view of the famous tidal bore from the Bay of Fundy. The University of Moncton is located here. Population, 1971, 47,781.

Montreal. The largest city of Canada, situated in south central Quebec on Montreal Island at the confluence of the Saint Lawrence and Ottawa rivers. The city lies mainly on the east and southern parts of the island and extends north and west to encircle Mount Royal, a magnificent park which commands a panoramic view of the area.

Montreal's harbor is the eastern terminus of the St. Lawrence Seaway, providing access for ocean ships to the head of the Great Lakes. The port, with 131 berths along its 12-mile waterfront is the world's second largest inland port, after Rotterdam. The island city is also a train and truck transportation center and is served by 17 airlines. The Metro, a 16-mile subway system, was first opened in 1966.

Montreal has progressed faster in redevelopment than any other city. While a few narrow streets still exist in the old part, restoration of them is under way to retain the atmosphere dating back to its early days. Other parts of the city are modern in all respects. Chief industries are oil and sugar refining, meat packing, brewing, and the manufacture of aircraft, iron and steel products, tobacco and leather goods, textiles, cement, and flour. The financial center of the nation's economy depends on the Montreal and Canadian Stock Exchanges at Place Victoria in the heart of the city. Place Ville Marie comprises a 42-story office complex and underground city of 40 acres filled with shops, restaurants, and theaters, where some 80,000 people shop and browse daily in a climate-controlled atmosphere. Place d'Armes has an imposing monument to Maisonneuve, founder of Montreal. It is surrounded by several noted buildings, one being Notre Dame Church, the most famous of the city's 300 churches and one of the largest in America. Rising in midtown Montreal is Mary Queen of the World Cathedral, a half-size replica of St. Peter's in Rome.

Place des Arts, with two theaters and a 3000-seat concert hall, is the home of the Montreal Symphony Orchestra. Other cultural centers are the Montreal Museum of Fine Arts, Redpath Museum of McGill University, Contemporary Arts Museum, the Institute of Applied Arts, and the Mount Royal Art Center.

Two man-made islands in the St. Lawrence were the scene of the world's fair Expo '67. At the close of the fair, a large permanent exhibit, Man and His World, and a 135-acre amusement park, La Ronde, became enormously popular as tourist attractions.

Montreal is the seat of McGill University, Montreal University, and a number of colleges. A majority of the population is bilingual. About one-half the inhabitants are of French descent. The prevailing religion is Catholicism.

Montreal was founded in 1642 by Maisonneuve as a religious colony; but, as the outpost of civilization at the door of the Iroquois country, it became a military post, fur trading center, and base for explorations. It was taken by the British in 1760 and was held by the American Continental army in 1775–76. Population, 1971, 1,197,753.

Moose Jaw. A commercial and manufacturing city of south central Saskatchewan, the center of a rich mixed farming district. The city has large stockyards. The industrial products include flour and cereals, oil refining, brick, clothing, millwork, steel products, roofing materials, and insecticides. A potash mine operates nearby. Population, 1971, 31,284.

Muskoka. A lake region of Ontario. It embraces about 4000 square miles lying east of Georgian bay and about 100 miles north of Toronto. Of its 800 to 1000 lakes, the chief are Muskoka, 19 miles long, Rosseau, 12 miles long, and Joseph, 14 miles long. These three lakes are connected and have regular steamship service in summer. The region has extensive forests. Its numerous rivers, lakes, and islands make it an extremely popular playground for summer residents and visitors. The eastern part of the territory is sometimes called the Lake of Bays region, after the largest lake in it. Farther to the northeast lies the Algonquin provincial park, an untamed region of over 2000 square miles.

New Westminster. A port and lumbering center of southwestern British Columbia, situated on the Fraser River 17 miles from its mouth. With an excellent harbor and retail facilities, it is a thriving port, particularly for lumber, which is the city's leading manufacture. Others include paper, fish products, and canned goods. Population, 1971, 42,083.

Niagara Falls. A city of Ontario on the Niagara River beside the cataract. Hydroelectric power developed at and near the city on the Canadian side totals about 3,000,000 horsepower. As in similar developments on the American side, water is pumped electrically by night to a huge reservoir, from which the water is used during the day to develop additional power. The reservoirs are used also in drawing off additional water from the river above the falls at night and in the winter for power purposes. Thus the drain on the cataract's volume of water is kept at a minimum for sightseeing purposes, while at the same time the erosion at the brink of the falls is reduced.

In June 1969 the waters of the Niagara were diverted to the Horseshoe Falls to allow geologists to study how best to curb rock falls on the American side before the waters resumed their normal flow in December 1969.

The city commands a magnificent view of the entire falls from Victoria Park, color illumination being provided for 2½ hours nightly. A panoramic view may be had from three observation towers; a close-up view of the Horseshoe (Canadian) Falls from Table Rock House. At Rainbow Bridge, leading to Niagara Falls, N.Y., is Carillon Tower, containing a 55-bell carillon. The Oakes Garden Theatre has gardens and an open-air amphitheater.

The city's chief manufactures include abrasives, cereals, insulators, and metal products. Incorporated as the village of Elgin in 1853 and the town of Clifton in 1856, Niagara Falls was given this name in 1881 and became a city in 1904. Population, 1971, 65,271.

Oshawa. A manufacturing city of Ontario, situated on Lake Ontario about 30 miles east of Toronto. It is the chief center in Canada for the manufacture of automobiles, particularly of those made by Canadian subsidiaries of the General Motors Corporation. Other industrial products include leather, foundry products, canned goods, glass, and bathing suits. In a large block near the center of the city is the Canadian Automotive Museum, which visually reconstructs the history and prospects of this type of transportation. Oshawa has a huge shopping center laid out in the form of a landscaped mall, with an underground trucking concourse. Population, 1971, 91,113.

Ottawa. The capital and one of the largest cities of Canada, lying in southeastern Ontario and picturesquely situated on the high southern bank of the Ottawa River about 120 miles above its mouth at Montreal. The river, following a winding course between wooded banks and dropping 40 feet at the magnificent Chaudière Falls, presents a beautiful view from Parliament Hill, upon which stands the Parliament Building. Rideau Canal separates Ottawa into west and east parts, known as Upper Town and Lower Town, and inhabited by French and English people respectively.

The Parliament Buildings, Gothic in style, front and flank Confederation Square. The central tower, 291 feet high and known as the "Peace Tower," houses a carillon of 53 bells, one of the finest on the continent. The old, impressive Governor-General's house, Rideau Hall, contrasts with the modern city hall. Among the numerous churches are the Catholic Basilica of Notre Dame and the Anglican Christ Church Cathedral. The famous hotel Chateau Laurier evokes the lines of a castle in old France. Notable also are the National Gallery of Canada, the Dominion Observatory, the Supreme Court of Canada, and the University of Ottawa. The National Arts Center, a 2300-seat concert hall and a theater, was opened in 1969. Winter and summer sports are held at the $9 million Civic Center arena-stadium.

A National Capital Commission was created in 1958 to develop the city and its environs. Among its most impressive achievements was the development of the 100-square-mile Gatineau Park immediately across the Ottawa River from the city. This includes the estate of the former prime minister Mackenzie King, who had re-erected there a number of historic buildings. The commission supervises the tulip festival with its million plants from Holland and provides the many parks and connecting driveways with flowers blooming from spring to late fall. The manufacture of paper products is the city's only sizable industry.

Ottawa was formerly called Bytown in honor of its founder, the engineer in charge of the construction of Rideau Canal, which provides direct communication by water between the Ottawa River and Lake Ontario. The settlement was chartered as a city under the name of Ottawa in 1854 and was selected as the capital of Canada in 1858. Population, 1971, 298,087.

Outremont (*ōō'tr'-mōN'*). A city of Quebec on Montreal Island, surrounded by the city of Montreal. It is almost entirely residential in character, having very few industries. Population, 1971, 28,402.

Prince Rupert. A seaport of west central British Columbia, situated on an island connected with the mainland by a steel bridge. It has a natural harbor formed by an inlet of the Pacific Ocean. Prince Rupert forms a western terminus of the Canadian National railways. It is the southern terminus of the Alaska Marine Ferry System and the northern terminus of the ferry system from Vancouver Island. It ships large quantities of grain as well as the output of its halibut processing and its lumber and pulp mills. Its Centennial Museum has a famous collection of carved totem poles. Population, 1971, 15,355.

Quebec. Capital of the province of Quebec and one of the largest cities of Canada. It is picturesquely situated on a bold promontory at the head of the Saint Lawrence estuary. The city was founded by Champlain in 1608 and was long the center of exploration and of government by the French in the northern part of the continent. In 1759, as a result of the battle of the Plains of Abraham, the city, along with the rest of French Canada, fell into the hands of the British. It was unsuccessfully attacked in 1775 by an American force under Montgomery.

The city's importance was due partly to its strong natural defenses and partly to its strategical position, which commanded the entrance to the river leading to the interior of the continent. Quebec is still the point of entry for immigrants from Europe and is the terminus of larger ocean liners. It has one of the largest dry docks in the world. The chief industrial interests include iron castings, pulp and paper, machinery, cutlery, steel, woolens, lumber, tobacco, and rope. Hydroelectric power is available from the Montmorency and Shawinigan falls. The Saint Lawrence River is crossed at Quebec by a bridge which has one of the longest cantilever spans in the world.

The appearance of Quebec reflects the history of the city. The highest point, Cape Diamond, is 333 feet above the river and is crowned by a citadel within a walled enclosure covering 40 acres. On these defensive works over $30 million were spent in the early decades of the 19th century. The upper town, containing the citadel, is used as a residential district and has many of the finer churches and public buildings. Dufferin Terrace, a magnificent promenade, a half mile long, overlooks the Saint Lawrence, which lies 200 feet below. The upper town is reached from the other division of the city, called the lower town, by roads cut in the rock, by flights of steps, and by an elevator. The streets of the lower town are narrow and winding, and they recall the appearance of certain provincial towns of France.

The city's most noteworthy edifices include the Parliament buildings; Château Frontenac; the church of Notre Dame des Victoires, built in 1688; the handsome Franciscan convent; the Ursuline convent, which contains the remains of Montcalm; the Anglican Cathedral; and the Notre Dame de Quebec built in 1647, which contained many valuable pictures and relics. The last-named building was burned in 1922 but has since been rebuilt on the original model. There are numerous statues and monuments of historic interest. In the governor's garden, stands a plain granite column erected to the memory of Wolfe and of Montcalm, both generals having fallen in action at the battle which decided the city's fate.

Quebec is the seat of Laval University, which was chartered by Queen Victoria and Pope Pius IX and is an out-

growth of the Grand Seminary founded in 1663. In the immediate vicinity are Battlefields Park, Wolfe's Cove, the Shrine of Sainte Anne de Beaupré, and many other points of interest. The city is reputed for a famous winter carnival. It has a literary and historical society founded in 1824. The great majority of the population are of French descent, and the prevailing religion is Catholicism. Population, 1971, 182,418.

Regina. The capital and largest city of Saskatchewan, lying in the south central part of the province. Regina was formerly the capital of the Northwest Territories, and is still the western headquarters and training center for the Royal Canadian Mounted Police.

The Regina Campus of the University of Saskatchewan is the city's leading educational institution. Other impressive buildings are the Legislative Building, the curvilinear Saskatchewan Power Corp. Building, the Museum of Natural History, and the Mackenzie Art Gallery.

Founded in 1883, Regina is a service and distribution center for a rich wheat-farming, potash-mining, and oil-producing district. Its chief industries include steel, steel pipes, cement, meat packing, farm machinery, and petroleum products. Population 1971, 137,759.

Sainte Anne de Beaupré (*sănt ăn dĕ bō′prā′*). A village and famous Catholic pilgrim resort 20 miles east of Quebec. A chapel was built there in 1658, on which occasion a devout inhabitant of Beaupré who suffered from rheumatism, after laying three stones on the foundation, found himself free from his affliction. This occurrence was the first of many instances of miraculous healing credited to the saint at the shrine. In 1676 the chapel was superseded by a church, which was replaced by a much larger one in 1876. In 1922 the building was destroyed by fire, but was replaced by a new church, which is one of the finest in Canada. The shrine is annually visited by pilgrims numbering upward of one million. Population, 1971, 1474.

Saint Catharines. A trading and manufacturing city of south central Ontario in the Niagara peninsula on the south shore of Lake Ontario and 12 miles west of Niagara River. It is set in a rich fruit-growing district and celebrates each September as Grape and Wine Festival Time. St. Catharines owes its early growth to the Welland Canal, which was opened in 1829 and was subsequently reconstructed and enlarged to become a key canal in the St. Lawrence Seaway. The Garden City Skyway carries traffic above the canal to avoid delays due to the lift bridge spanning the busy waterways. Manufactures include paper, automobile parts, and a wide variety of other products. It is the seat of Brock University. The Lakeside Amusement Park fronts on Lake Ontario. Population, 971, 109,636.

Saint John. The largest city of New Brunswick, situated at the mouth of the Saint John River on the Bay of Fundy. In the vicinity is the noted "reversing falls," spanned by a steel arch bridge.

St. John is the geographical hub of three Canadian provinces. It is the rail and highway link between east and west besides being an ocean port with a year-round ice-free harbor which handles large shipments of grain and miscellaneous commerce. It has one of the world's largest dry docks and shipbuilding yards. Manufactures include sugar, brushes and brush making machinery, pulp and newsprint, brass goods, petroleum products, lumber, wire and cable, and large thermal electric installations. Parks and public gardens cover more than 500 acres.

St. John was a village of a few hundred people in 1783, when some 9000 refugees from the United States arrived after the Revolutionary War. The coming of these United Empire Loyalists is commemorated in the Loyalist House, built in 1810 and restored a century and a half later. The city was incorporated in 1785 under royal charter—the first city in Canada. Population, 1971, 87,910.

Saint John's. Provincial capital of the island province of Newfoundland. Situated on the coast near the easternmost point of land in North America, Saint John's has a superb harbor capable of accommodating the largest ships. It is the trading center of the province, but its main business is the fishing industry. The Roman Catholic and Anglican cathedrals are both named for St. John the Baptist, on whose feast day, June 24, John Cabot is traditionally believed to have discovered the harbor in 1497, and honored it with the saint's name. Sir Humphrey Gilbert established an English settlement here in 1583. Captured and destroyed twice by the French, Saint John's was finally taken by the English in 1702. Here Marconi received the first wireless message sent across the ocean, 1901. Also the English aviators Alcock and Brown took off from here in 1919 for the first nonstop trans-Atlantic flight. It is the eastern terminus of the Trans-Canada Highway. Population, 1971, 86,290.

Sarnia. An oil refining and petrochemical manufacturing city in southern Ontario situated at the southern tip of Lake Huron. It is connected with Port Huron, Mich., by a tunnel under the St. Claire River, opened in 1891, and by the high-level Blue Water Bridge. Extensive salt deposits and oil wells in the vicinity gave Sarnia its start, but its importance as an industrial center began with the establishment of a synthetic rubber plant and large oil refineries after World War I. Other manufactures include a wide variety of chemicals, foundry products, fiber glass, and plastics. The opening of the St. Lawrence Seaway made it an ocean port.

Among the city's features are Canatara Park on the lake shore and its city hall of strikingly modern construction. Population, 1971, 56,727.

Saskatoon (*săs′kə-tōōn′*). The second largest city of Saskatchewan, situated on both sides of the South Saskatchewan River, which is here spanned by six bridges. It lies about 150 miles northwest of Regina. The city is the center of rich farming lands, for irrigation of which a 210-foot-high earth dam on the South Saskatchewan River was constructed in the 1960's. The largest known potash mines anywhere contribute to the city's industrial interests, which include oil refining and the manufacture of machinery, cement, chemicals, and flour. The University of Saskatchewan, Saskatoon, occupies a 3200-acre campus. Other features include the 18-story CN Towers, the Jubilee Auditorium, and the Western Development Museum. Saskatoon was incorporated as a city in 1906. Population, 1971, 125,079.

Sault Sainte Marie (*sōō′ sânt mä-rē′*). A manufacturing city of Ontario, situated on the Saint Mary's River, which is here crossed by a bridge one mile in length. Navigation in the river, which connects lakes Superior, Michigan, and Huron, depends on a ship canal. The first one was first opened in 1895; after frequent enlargements it finally became a key link in the St. Lawrence Seaway. The city's largest industry is steel manufacturing. Other industrial products include paper, chemicals, lumber, and beer. The city owns the 75-acre Point des Chenes Park, 12 miles to the west. Population, 1971, 78,175.

Sherbrooke. A manufacturing city of southeastern Quebec about 85 miles east of Montreal. Among its varied manufactures are textiles, machinery, pulp and paper, and machinery. It has two universities—the University of Sherbrooke (French) and Bishop's University (English). Population, 1971, 80,457.

Stratford. A city of southern Ontario, about 90 miles west of Toronto. Stratford arose as a trade center for the surrounding agricultural region. The principal industrial products are furniture and automotive supplies. The city is best known for its Festival Theater, where Shakespearean and other dramas are given during four months each summer, attracting visitors from many countries. The beautiful circular theater is located in Queen's Park, part of a 750-acre system of parks on both sides of the river Avon throughout its course traversing the city. Population, 1971, 23,863.

Sudbury. A mining city of Ontario about 60 miles north of the northern shore of Georgian Bay. Here is mined the greater part of the world's output of nickel; also most of the copper produced in Ontario. The city is the seat of Laurentian University and has an art gallery and a government school of mines. Population, 1971, 153,959.

Sydney. A city in northeastern Nova Scotia, situated on a natural harbor on the east coast of Cape Breton Island. Sydney is noted as a center for coal mining and for the manufacture of steel. It is also a well-known summer resort. Population, 1971, 32,459.

Thetford Mines. A mining town about 75 miles south of Quebec City, noted, along with Black Lake in the vicinity, as a center of the district which produces a large proportion of the world's supply of commercial asbestos. Population, 1971, 21,662.

Three Rivers (Trois Rivières). A manufacturing city of Quebec, situated on the north bank of the Saint Lawrence River where the two mouths of the Saint Maurice River enter it. It is 78 miles southwest of the city of Quebec. Long the center of a large lumber, cattle, and grain trade, it began to grow rapidly with the development of hydroelectric power from nearby waterfalls. Paper and pulp manufacture became the leading industry. With its three large paper mills, it is said to be the world's largest center of newsprint production. Other manufactures include electric lamps, chemicals, cement, and structural steel. Three Rivers was founded in 1634 by Samuel de Champlain. Population, 1971, 55,240.

Toronto. The capital and largest city of Ontario and the second largest city in Canada, situated on the northwest shore of Lake Ontario. Its natural harbor in recent years has been greatly enlarged and improved. About 2000 acres at the waterfront, largely reclaimed land, is municipally owned and used for industrial establishments,

railroad sidings, waterways, and parks. The offshore Toronto Island accommodates the city's airport.

As an industrial, railroad, financial, and commercial center, Toronto ranks second only to Montreal. *Turbo*, the new turbine-train runs between these two cities. Toronto's leading manufactures are lumber, farm implements, automobiles, car shop products, packed meats, rubber goods, food products, clothing, hosiery and knit goods, soap, iron castings, and musical instruments. The Toronto hydroelectric system is one of the largest municipal supply undertakings on the continent.

The city rises from the shore to an elevation of about 300 feet. This variation in level lends itself to the construction of many beautiful driveways and boulevards, connecting a large number of parks, the largest being High Park, near which is an elaborate pleasure resort.

The Parliament buildings, in Queen's Park, are the government headquarters of Ontario's more than seven million people. This massive complex is constructed of red stone in the Romanesque style of architecture. Opposite these buildings is the Sigmund Samuel Canadiana building of the Royal Ontario Museum, which houses a fine collection of Canada's historic treasures. Nearby are the many colleges and professional schools of the University of Toronto. Other buildings are the O'Keefe Centre for the performing arts; the main branch of the Public Library, where the Robertson Historical Collection is displayed; and the Art Gallery of Toronto, containing masterpieces by Rembrandt, Gainsborough, Picasso, and several French Impressionists. Riverdale Zoo is notable for its exotic animals and jungle birds. Maple Leaf Gardens is one of Canada's largest auditoriums.

The modern city hall was the first project in Toronto's comprehensive redevelopment program. Dominating the 11½-acre civic center, Nathan Phillips Square, it is in the form of two tall, marble-veneer buildings facing each other in a concave outline embracing a low-lying cupola—the council chamber and auditorium set between them. The square has reflecting pools embellished with fountains, ornamental trees, and an imposing sculpture by Henry Moore. One of Canada's tallest buildings, a 56-story structure, is the headquarters of the Toronto-Dominion bank. By mid-1969, a still higher office building, to be the nation's tallest, was well under way for the Canadian Imperial Bank of Commerce. Many international business firms have headquarters in the city.

The Canadian National Exhibition, an annual fair, is normally visited by more than three million people. On the Exhibition grounds, the Hockey Hall of Fame honors outstanding figures of the country's national sport.

While Toronto owns its own surface transportation system and subway, it does so subject to a larger metropolitan municipality which takes in also 12 suburban areas, the whole covering 240 square miles. The latter has legislative power over finances, roads, education, parks, police, housing, welfare, and pollution control.

Toronto was founded in 1749 as York, and became the capital of Upper Canada in 1793. York was captured by the Americans in 1813. In 1834 it was incorporated under the name of Toronto. Population, 1971, 698,634.

Vancouver. The largest city of British Columbia and one of the largest in Canada, situated at the southwest extremity of the mainland on Burrard inlet, a deep arm of the Strait of Georgia. The harbor is one of the finest on the globe and has helped to place Vancouver among the leading ports of the continent. The area of the harbor is 48 square miles, of which 28 are landlocked. Here Canada's two transcontinental railroads meet the transoceanic shipping lines. Wheat is the chief export. Shipbuilding, lumbering, and salmon-canning are major industries. Vancouver is the commercial metropolis of British Columbia. It has launched an extensive redevelopment program.

The city has several parks and recreation areas. Stanley Park is a partly cleared forest area of 1000 acres, situated on a cape and surrounded by a 9-mile drive along the shore. The city's highest point is the 410-foot Little Mountain in Queen Elizabeth Park, which affords a panoramic view of the city, harbor, and North Shore Mountains. The B.C. Hydroelectric Building (all glass and perpetually lighted), the courthouse, the general hospital, and numerous high-rise office and apartment buildings give the city a striking skyline.

The University of British Columbia and the Simon Fraser University are located here. There are also two community colleges and several art galleries and museums. The Queen Elizabeth Theatre complex affords a variety of year-round entertainment. The Pacific National Exhibition, similar to Toronto's is an annual event for western Canada. Ferry service links Vancouver Island, across the Strait of Georgia, with the mainland.

Incorporated in 1886 with 600 inhabitants, the city, named for Capt. George Vancouver, a British naval officer, grew rapidly when it was connected by railroad with eastern Canada in 1887. Population, 1971, 419,433.

Verdun. A city of Quebec on Montreal Island. It is a residential suburb of Montreal, the southern border of which it adjoins. Population, 1971, 74,520.

Victoria. The capital of British Columbia, occupying the extreme southeastern point of Vancouver Island on the Strait of Juan de Fuca. Possessing a commodious harbor, and being advantageously located from a commercial standpoint, Victoria ranks as one of the four largest ports of Canada. It is the western terminus of the Trans-Canada Highway. Victoria's economy is supported mainly by service industries, including government, trade, and entertainment of tourists. The other industries include manufacture of wood products, fishing, and market and flower gardening. There are three large shipbuilding yards. An extensive trade is carried on in coal, timber, and canned salmon.

The city has fine streets with many beautiful residences, and its delightful climate and beautiful environment attract numerous summer visitors. Beacon Hill Park is the city's chief recreation ground. The provincial Parliament buildings of gray stone are of high architectural merit. The Dominion Astrophysical Laboratory in the city has one of the world's largest telescopes. Adjoining Victoria is Esquimalt, the naval base and dockyard.

Fort Victoria was erected on the present site of the city in 1843 as a trading post of the Hudson's Bay Company. The place was incorporated as Victoria in 1862 and became the capital of British Columbia in 1868. The inhabitants are predominantly of British birth or descent. Population, 1971, 60,897.

Whitehorse, capital and chief city of the Yukon, is in the southern part of the territory. It has an airport and is connected by rail with Skagway, Alaska, and by the Alaska Highway with Dawson Creek, B. C. Population, 1971, 11,084.

Windsor. The most southerly city of Canada, lying in southern Ontario on the Detroit River, opposite Detroit, Mich., with which it is connected by a vehicular tunnel and by the Ambassador suspension bridge, which has a central span of 1850 feet. Windsor is the chief center of automobile production in Canada. Other industrial products are iron and steel, paints and varnishes, salt, drugs, and prepared foods. It is the seat of the University of Windsor and has also the Willistead Art Gallery and Hiram Walker Historical Museum. Windsor became a town in 1858 and was incorporated as a city in 1892. Population, 1971, 199,784.

Winnipeg. The capital of Manitoba and one of the largest cities of Canada. It is located in the southern part of the province at the junction of the Red and Assiniboine rivers. In commerce, Winnipeg occupies a strategic position, comparable to that of Chicago. All traffic between eastern and western Canada is routed through Winnipeg. The city is served by the two Canadian transcontinental railways, with western headquarters here; by several American lines; and by many railroads radiating throughout the rich agricultural district in which it is situated. It is the largest cash grain market in the world, the Winnipeg Grain Exchange having one of the busiest "trading pits" anywhere. Besides being a valuable livestock market, it is the base of the Canadian Wheat Board, which handles the sale of the country's vast wheat crop.

Winnipeg ranks among the leading manufacturing cities of Canada, partly by reason of the availability of cheap hydroelectric power, which is developed from the Winnipeg River rapids. Among the chief industrial products are flour, farm machinery, processed foods, lumber, pulp, and paper. Printing and publishing are also important.

Winnipeg has grown rapidly, its economy being based on its rich agricultural and mineral resources. The modern city hall complex is indicative of its long-range renewal schedule. In 1968 a new concert hall was opened, and completion of a new 6-story museum was scheduled before 1971. The city has one of the most modern air terminals on the continent.

Of the several parks, Fort Garry Park has the greatest historical interest, while the 362-acre Assiniboine Park, containing a zoo and a horticultural conservatory, is the largest. Outstanding in another park is the provincial Legislative Building, built in classic Greek style with a 255-foot dome.

The suburb of Saint Boniface is the Roman Catholic headquarters of the West. It has a magnificent cathedral, the archbishop's palace, and the Catholic College of Saint Boniface. It is the birthplace and burial place of Louis Riel, leader of the Red River rebellion in 1869–70.

The University of Manitoba (1877) and the University of Winnipeg (1871) are the oldest institutions of higher education in western Canada.

In 1733, on the site now occupied by Winnipeg, the French explorer, La Verendrye, built Fort Rouge, a name now used to designate a favorite residential section of the city. In 1821, the Hudson's Bay Company built Fort Garry. The population in 1870 was 250. In 1873 the place was incorporated and the name was changed from Fort Garry to Winnipeg. Population, exclusive of suburbs, 1971, 243,208.

Geography

A federal republic of North America, lying south of the United States and extending southeast to Guatemala. The outline of the country resembles a cornucopia modified by two irregularities,—the peninsula of Yucatan in the southeast and the peninsula of Baha California in the northwest. Its area is 760,375 square miles, about half of which is in the Torrid Zone. Its maximum length is over 1900 miles, and its width varies from 1833 miles, along the northern boundary, to 134 miles, at the Isthmus of Tehuantepec. The coast line on the Gulf of Mexico and the Caribbean Sea measures 1727 miles, while the coast line on the Pacific Ocean and on the Gulf of California has a total length of 4574 miles.

Surface and Drainage. The greater part of Mexico consists of a central plateau, called the *tierras templadas*, having an elevation of from 3000 to 8000 feet. It is flanked on the east by a high range of mountains called the Sierra Madre Oriental. At the Isthmus of Tehuantepec, this range converges with the Sierra Madre Occidental, which flanks the central plateau on the west. The mountains of the Isthmus of Tehuantepec belong to the Central American system. The lofty areas above an altitude of 8000 feet are known as the *tierras frias*. On each side of the country, lowlands, or *tierras calientes*, form a fringe between the coast and the mountain range. The peninsula of Yucatan is, for the most part, a low, sandy plain. Baja California is mountainous and consists of a southern extension of the Sierra Nevada range.

The central plateau is of volcanic origin and the sierras contain a large number of volcanoes. The highest, Citaltepetl (Orizaba), has not been active since the 16th century. Its elevation is 18,700 feet. Popocatepetl, "Smoky Mountain," and Iztaccihuatl, "White Woman," are extinct. Violent earthquakes are frequent. In 1920, in the Orizaba Volcano district, about 3000 people were killed by seismic disturbances and ten towns were partially or wholly destroyed.

The drainage system of Mexico is simple. The central plateau has a number of lakes but no large rivers. Several short streams flow from the mountain ranges into the sea. The Rio Grande, on the northern border, receives little water from the Mexican side. No river of Mexico is navigable throughout the year.

Climate and Flora. The *tierras calientes*, on the east, are subject to great heat and a heavy rainfall. They support a luxuriant vegetation and valuable food plants. The banana, coconut, pineapple, pomegranate, vanilla, cacao, and ginger are produced in abundance. Sisal hemp is grown in Yucatan and is exported in large quantities to the United States to be used in the manufacture of rope. Mexico's forest areas, which are estimated to cover 95 million acres, are mainly in the lowlands. Mahogany, ebony, rosewood, and rubber are among the more valuable products of the tropical forests. The Pacific lowlands are arid in the north but have a more copious rainfall in the south.

The plateau has a temperate climate and is well adapted for the cultivation of cotton, tobacco, coffee, rice, sugar cane, corn, wheat, and potatoes. The rainfall in general is light but varies considerably in different parts. The north portion is dry; the cactus appears as a characteristic plant, and irrigation is necessary for successful agriculture. In some parts. however, two or three crops a year may be raised. The forest areas of the plateau contain oak, myrtle, fir, spruce, and pine. The higher mountain regions support an alpine flora.

Animal Life. The lowlands are the habitat of monkeys, pumas, jaguars, ocelots, sloths, armadillos, parrots, parakeets, humming birds, alligators, venomous snakes, and many other animals characteristic of a tropical fauna. The wolf, coyote, otter, and deer are found in the central plateau.

Minerals and Mining. The mineral resources of Mexico make her potentially one of the richest countries in the world. Mining is the chief industry, and petroleum is the chief product. It is estimated that Mexican mines have yielded over $3 billion worth of silver. Mexico is also one of the world's greatest copper and lead producing countries. Gold, zinc, antimony, tungsten, molybdenum, mercury, and opals are also exported. Near the city of Durango is a large hill, the Cerro de Mercado, composed almost entirely of pure iron ore. Improved transportation facilities and development of the vast mineral deposits have been possible with capital from increased tourism.

Other Industries. The production of coffee exceeds a value of $100 million each year. Other large crops are corn, rice, sugar cane, wheat, beans, tomatoes, oranges, and bananas. Irrigation is essential for much of the production and a number of large dams have been constructed for this purpose and to develop electric power. The area employed for grazing purposes is about four times that devoted to agriculture. The chief manufactures are cotton and wool textiles, tobacco and rubber products, iron and steel, cement, shoes, glass, silver and leather handicraft, and pottery.

Inhabitants. The population of Mexico in 1970 was 48,313,438. The language is Spanish, and the prevailing religion is Roman Catholicism. Elementary education is free and compulsory. The largest and oldest university, the University of Mexico, was founded in 1552. The chief cities, in addition to those described below include Monterrey (1,177,361), Ciudad Juarez (436,054), Leon (453,976), Torreon, (257,045), Tijuana (335,125), and Mexicali (390,411).

Ruins in Yucatan. In Yucatan, the extreme eastern state of Mexico, are to be found the most impressive of the monuments left by the civilizations which flourished in America prior to its discovery by Europeans. Here was centered the New Mayan Empire, which was established by the Mayas after the fall of the Old Empire, the territory now known as Guatemala. The Old Empire flourished from the beginning of the Christian era until the 6th century A. D.

The causes of its fall form one of the fascinating enigmas of early American history. Mayan settlers entered Yucatan as early as the 4th century A. D., but the New Mayan Empire was not definitely established until about 1100 A. D. It continued until the coming of the Spaniards in the early 16th century. The chief centers were the capital, Uxmal, and the cities of Mayapan and Chichen-Itza.

The buildings are of one story in height, but in nearly all cases are situated on terraces or pyramids constructed of earth. They are faced with stone and have masonry steps for ascent and descent. The Temple of the Magician at Uxmal crowns a majestic pyramid 80 feet high and 240 by 180 feet at the base. The exterior is richly ornamented with carvings and relief work. Such carving was executed by stone tools, the only metals known to the builders being gold, silver, and copper. Since the true arch was unknown, roofs of Mayan buildings were either flat or, more often, vaulted. The buildings are very narrow, and the walls are usually from three to nine feet thick.

In central Mexico also are numerous pyramids surmounted by stone temples or palaces built by the Toltecs and Aztecs.

It was in what is now Mexico that corn was first cultivated and improved some 4000 to 2000 years before our era. It is believed that this provided a first basis for the civilizations that arose there.

Guadalajara (*gwä'thä-lä-hä'rä*). The second largest city of Mexico, situated about 150 miles inland from the center of the country's Pacific Coast. The climate is agreeable, the range of the temperature being limited to a few degrees. Guadalajara is an important mining center. The large waterfall of Juanacatlan near by furnishes electric power for street railroads, city lighting, and manufacturing. Among the manufactures are cotton goods, art pottery, tiles, leather articles, and cordage.

The city is well built and has spacious streets and several large parks embellished with fountains and statues. The principal building, the cathedral, noted for its ornamentation and magnificent interior, contains one of Murillo's masterpieces. Aqueducts, eight miles long, bring water to the city. Population, 1970, 1,196,218.

Mexico City. The capital and largest city of Mexico, situated somewhat southeast of the geographic center of the country at an elevation of 7415 feet. Majestic, snow-crowned mountains encircle the city, presenting a scene of surpassing grandeur. The climate is delightful; the air is dry, and the range of temperature seldom exceeds 15°.

Mexico City is the social, literary, financial, and industrial center of the country. Manufactures include textiles, chemicals, paper, boots and shoes, and foundry and tobacco products.

The city, founded by Cortez in 1521 on the site of the Aztec town Tenochtitlan, is regularly laid out with wide, well-paved streets, shaded boulevards, numerous parks and driveways embellished with statues and monuments, and several ornate squares. Mexico City abounds in churches. Fronting Plaza Mayor Square is the great cathedral, a magnificent structure in Spanish Renaissance style, the foundations of which were laid in 1573 on the site of an Aztec temple.

Tourism has greatly increased as a result of much improved roads and highways and the convenience of air travel. The visitor will find in Mexico City numerous buildings (with elaborate façades) and places noted for their beauty and historical associations. A few of these are the National Palace, which has several murals by Diego Rivera; the Palace of Fine Arts; the National Museum of Anthropology; Chapultepec castle, the executive mansion; Xochimilco and its "floating gardens"; the National University, founded in 1551; and the famous 22-ton Aztec calendar stone, noted for its remarkable accuracy.

The modern city has many tall buildings, some with entire walls of glass, others with colorful mosaics, which present an interesting contrast to the older buildings most of which are only one story high. The city, once the hub of Aztec civilization, has become a mecca for thousands of visitors each year. In less than forty years, it has grown from less than one million inhabitants to an estimated population of 3,025,564 in 1970.

Puebla (*pwä'blä*). An important city of Mexico, situated in the vicinity of several of the highest mountains in the country about 60 miles southeast of Mexico City. The manufactures include textiles, soap, glass, straw hats, pottery, and leather goods. Onyx articles, made from the stone quarried nearby, form an important article of export.

The city is well built and has all modern improvements. Besides several professional schools, there are three libraries, an imposing cathedral of Spanish architecture, an art gallery, a museum, an observatory, and many other institutions of note. A short distance from the city are the famous mineral springs of Tehuacan and the prehistoric pyramid of Cholula, 177 feet high and covering nearly 45 acres. The city was founded by the Franciscans in 1532. It was captured by the Americans in 1847 and was taken by the French in 1863. Population, est. 360,576.

Tampico (*tăm-pē'kō*). The best equipped port of Mexico, on the Panuco River near its mouth in the Gulf of Mexico. Petroleum is produced in large quantities in the vicinity and forms the chief article of export. Ores, hides, wood, wool, and hemp are also exported; manufactured goods, mainly from the United States, are imported. Modern warehouses, offices, and municipal improvements give Tampico a thoroughly up-to-date appearance. Population, 1970, 196,147.

Vera Cruz. An important seaport of Mexico, situated on the Bay of Campeche, an arm of the Gulf of Mexico. An enervating climate and the prevalence of yellow fever once gave Vera Cruz the name of the City of the Dead. Modern sanitation measures, however, have completely transformed living conditions.

Twenty-five million dollars have been spent on the improvement of the harbor. On a reef near its entrance stands the fortress of San Juan de Ulua. The exports consist chiefly of ore, chicle, dyewoods, and hides, and the imports include textiles, hardware, and other manufactured goods. Fishing is carried on extensively, and there is a considerable manufacturing industry. Population, 1970, 242,351.

CENTRAL AMERICA

A geographical term used to designate the neck of land which connects North America and South America. It stretches in a southeast and northwest direction, lies entirely within the Torrid Zone, and comprises the area between the Isthmus of Tehuantepec, in southern Mexico, on the north, and the Isthmus of Panama, immediately north of Colombia, on the south. Its area is approximately 200,000 square miles. Its width varies from about 30 miles at the Isthmus of Panama to 450 miles in southern Mexico.

Surface. The southwestern coast of Central America is skirted by a broken chain of mountains, which reach a maximum elevation of 13,000 feet. Their formation is distinct from that of the Rocky Mountains and of the Andes range. Volcanic eruptions and violent earthquakes are very frequent. The largest interruption of the mountainous highlands is the basin of Lake Nicaragua, which has a water area in excess of 3500 square miles. The northeastern side of the isthmus slopes gradually toward the sea and has a fertile and well watered soil.

Climate and Flora. The climate varies, according to elevation, from a tropical heat to an arctic rigor. The lava areas are extremely fertile and, where the climate is favorable, produce coffee, sugar, corn, pineapple, bananas, and other products of tropical agriculture. The forests of the lowland are rich in dyewoods and valuable cabinet woods. The higher districts have a characteristic temperate-zone and alpine flora.

Inhabitants. The total population is estimated at more than 15,000,000, mostly of Indian and Spanish blood. The majority live on the southwestern coastal area. Agriculture is the chief occupation, although vast mineral and forest resources await development. Textiles and other manufactured goods are imported. More than 80 per cent of the trade is with the United States.

Politically, Central America comprises the countries lying between Mexico on the north and Colombia on the south. Apart from the Panama Canal Zone and Belize, a member of the British Commonwealth, they consist of six independent republics—Guatemala, Honduras, El Salvador, Nicaragua, Costa Rica, and Panama. Roman Catholicism is the prevailing religion and Spanish is the common language.

Belize (British Honduras). Bordering on the Caribbean Sea, Mexico, and Guatemala, the area of Belize is 8598 square miles. Most of the surface is covered with tropical forests yielding mahogany, chicle, and logwood. Bananas and coconuts are also exported in considerable quantities. The coastal area is low, marshy, but not unhealthful. The estimated population in 1970 was 130,000, of whom about 98 per cent were of Negro and Indian origin. The capital is Belmopan. Control of the region was long disputed by the Spanish and it was not secured by Britain until 1836. The settlement was proclaimed a British colony in 1862. In 1884 it became an independent colony of Britain and was made self-governing in 1964.

Canal Zone. A strip of land ten miles wide, from the Atlantic Ocean to the Pacific. Through the zone runs the Panama Canal, finished by the U.S. in 1914. The Canal Zone divides the Republic of Panama into two parts. See *United States Dependencies* and *Panama Canal.*

Costa Rica (*kŏs'tä rē'kä*). A country occupying the section of Central America between Nicaragua and Panama. The area is about 20,000 square miles, a large part of which is an irregular tableland in which some mountain peaks attain an altitude of

more than 10,000 feet. Many mountains are volcanic and have caused a considerable loss of life.

Coffee is the staple product of the subtropical plateau, but cacao, tobacco, and sugar are also grown and exported. Costa Rica is one of the chief banana producing countries of the world. The fruit is grown extensively in the hot, tropical lowlands. Other important industries include lumbering, gold and silver mining, and cattle raising. The manufacture of fiber glass products, textiles, and fertilizers are among the newer industries.

The estimated population in 1970 was 1,800,000, a large number being of Spanish origin. San José is the capital. *Costa Rica* means "rich coast" and was given the name by Christopher Columbus in 1502.

El Salvador. The smallest, but next to Guatemala, the most populous republic of Central America, and the only one without an Atlantic coastline. It is southwest of Honduras, with a coastline of about 160 miles on the Pacific Ocean. Its area is about 8000 square miles. San Salvador is the capital.

There is a level coastal strip that rises, farther inland, to a mountainous plateau containing a number of active volcanoes. One of these, called the Izalco, or "lighthouse," began to rise from the plateau about a century ago and, by means of its own lava, has reached the height of a mile.

The volcanic area is extremely fertile and produces large crops of coffee, sugar, cotton, tobacco, and cacao. Coffee is the chief export, with cotton making great gains. Balsam and hardwoods are the principal forest products sent abroad. Cattle raising and gold and silver mining are carried on extensively. U.S. aid has helped the economic growth of the country considerably. The 1970 population estimate was 3,534,000.

Guatemala (*gwä'tâ-mä'lâ*). The second largest and the most populous country of Central America, lying between Mexico and the republic of Honduras. Its area is 45,452 square miles. A mountain ridge, which includes a number of volcanoes, divides the long eastern slope from the narrower but more thickly populated Pacific drainage area. Lake Peten, in the northern part of the country, is noted for being the habitat of 30 species of fish not found elsewhere.

The hot lowlands in the north and east are unhealthful but produce large crops of cacao, sugar cane, and bananas. The dense forests of the valleys yield valuable hardwoods, chicle, and rubber. The staple export of the country, however, is coffee, grown principally on the rich, volcanic soil of the plateau and the western slope. Two annual crops of wheat and three of corn are raised in this district. Cotton is a crop of more recent importance, and by 1961 had become the second largest export, after coffee. At the higher altitudes, apples and potatoes are grown and many cattle are raised. Beginning in 1952, a program of agrarian reform was put into operation, under which land not under cultivation might be expropriated, with eventual compensation, and divided into small holdings.

The population of Guatemala, 1970 est., was 5,188,981, more than half of whom are pure Indians. Guatemala is the capital and lies on the interoceanic railway which connects Puerto Barrios, the port on the Gulf of Honduras, with San José and other ports on the Pacific coast.

Honduras. A country of Central America, lying between Guatemala and Nicaragua, with a coast line of 400 miles on the Caribbean Sea. The southwestern boundary is El Salvador and the Gulf of Fonseca, an inlet of the Pacific Ocean. The surface covers 44,275 square miles, the greater part of which is a plateau ranging in elevation from 5000 to 10,000 feet.

The hot, malarial coastal region produces the bulk of the country's staple export—bananas. Coconuts are grown there also, and, farther inland, large crops of sugar, tobacco, and coffee are produced. Corn is cultivated as the chief article of domestic consumption. Stock raising is one of the principal industries. The dense forests of the coast area and of the valleys yield rubber, dyewoods, and medicinal plants. Cigars and Panama hats are manufactured for export.

The mineral resources of the country are extensive but production is confined to silver, lead, and zinc. Foreign concessionaires must employ Hondurans up to at least half of their labor force. Railroads, totaling about 850 miles, are used mainly to transport bananas. The normal means of transport for both passengers and freight is by airplanes, which are treated as casually as buses. There is one large international airport, at Tegucigalpa, which is the capital and largest city.

The population of the country in 1970 (est.) was 2,582,000. While Spanish is the official language, a number of aboriginal tribes speak languages of their own.

Nicaragua (*nĭk'ä-rä'gwä*). The largest country of Central America, situated at the center of the intercontinental neck. Its surface is mountainous in the northern and western part, where there are several volcanoes. The eastern section is low, and, in the south, there is a depression forming the basin of Lake Nicaragua, Central America's largest inland body of water. The area of the country is 57,143 square miles.

Most of the population is found in the fertile, volcanic valleys of the uplands on the western side of the country, of which the chief agricultural products are coffee, cacao, sugar cane, and corn. Cattle are raised and the export of hides is important. Bananas are grown in large quantities in the eastern lowlands. Forest industries rank second in importance, timber, dyewoods, gums, oils, fibers, and rubber being obtained on both coasts of the country. Gold and silver are mined. The chief manufactures are Panama hats and cigars.

The estimated population of Nicaragua in 1970 was 1,984,000. The two principal cities are Managua and Leon, the former being the seat of the national government. The Pacific Coast ports of Corinto and San Juan del Sur handle most of the foreign trade. In 1916 the U. S. purchased from Nicaragua the right to build an interoceanic canal through the country. The treaty ended in 1970.

Panama (*păn'ä-mä'*). The most eastern country of Central America, stretching from Costa Rica about 480 miles east to Colombia. It occupies the narrowest part of the intercontinental neck and is divided into two parts by the Canal Zone, ten miles in width, controlled by the United States. The area of the country is 28,576 square miles.

Panama is traversed by two broken mountain chains, which are overgrown with dense forests containing rubber trees and valuable hardwoods. Bananas and coconuts are produced in the hot lowlands, and sugar cane, coffee, cacao, and tobacco are grown at higher altitudes. A considerable number of cattle are raised, and hides form a valuable article of export.

The population of Panama, exclusive of the Canal Zone, was estimated to be 1,463,500 in 1970. The city of Panama is the seat of government.

Belize City (*bĕ-lēz'*). The chief seaport of Belize is situated at the mouth of the Belize river near the center of the country's seacoast. The climate is hot but not unhealthful. The exports go mainly to the United States and consist chiefly of mahogany, logwood, coconuts, and bananas. Population, 1965, 45,055.

Guatemala City. The capital of the country of the same name. Guatemala is an inland commercial city, situated in the southern part of the country about 85 miles from the Pacific coast on a plateau 5000 feet above the sea. A large part of its trade is in coffee. The city has various professional schools, a university, and a cathedral, which is the seat of the archbishop. Guatemala has been destroyed four times by earthquakes, most recently in 1976. Pop. 1970, 730,991.

Leon (*lā-ōn'*). A metropolis of Nicaragua and formerly its capital, situated about 15 miles from the coast in the western portion of the country. It has a cathedral built in the Renaissance style, and is the seat of a university. Population, about 47,000.

Managua (*mă-nă'gwă*). The capital of Nicaragua, situated about 25 miles inland from the center of the state Pacific coast line. It is a commercial center for the marketing of coffee grown in the region. The city is the seat of the Central University of Nicaragua. Managua was almost entirely destroyed by earthquake in 1972, but rebuilding was begun at once. Population 262,047.

Panama City. The capital of the Republic of Panama, situated at the head of Panama Bay near the southern terminus of the Panama Canal.

Panama, founded by Pedro Arias in 1519, was one of the first European settlements in the western hemisphere. It was long the capital and Pacific metropolis of Spain's vast possessions in America. Population, 1970, 418,013.

San José (*săn hô-sā'*). The capital of Costa Rica situated in a rich coffee growing region. The city is regularly built and has broad streets, fronted for the most part by one-story brick houses. The principal buildings include the national palace, the university, and the national theater. Population, 1970, 203,148.

San Salvador. The capital and largest city of El Salvador, situated in a fertile valley about 25 miles from the coast. It is about three miles from the volcano of San Salvador, which destroyed most of the city three times. The houses are surrounded by open ground and built low in order to minimize the danger during possible earthquakes. The city carries on an active trade in tobacco, and other products of the region. It has a university, a national library, and a fine botanical garden. Salvador is one of the oldest settlements of the western hemisphere, being founded in 1528 by Alvarado. Pop. 1970, 349,333.

Tegucigalpa (*tă-gōō'sē-gäl'pă*). The capital of Honduras, situated in the southern part of the country about 50 miles from San Lorenzo, its port on the Gulf of Fonseca. The agricultural and mining interests of the surrounding region center in the city, which is also the seat of a national university and of several colleges. Tegucigalpa was formerly an Aztec city. It was made the capital of Honduras in 1880. Population, 1970, 232,276.

THE WEST INDIES

A large group of islands lying between North America and South America and forming the barrier between the Atlantic Ocean and the Caribbean Sea. They stretch in a great curve from Florida east and south to the mouth of the Orinoco river in Venezuela. Their total area is about 92,000 square miles; their population, more than 25,000,000. Most of the islands are rocky. They receive copious rain, brought principally in the summer by the northeast trade winds, which at times develop into destructive hurricanes.

The largest island is Cuba, which, like the two republics on the island of Hispaniola, is an independent country. Puerto Rico belongs to the United States.

Cuba, Hispaniola, Jamaica, and Puerto Rico are sometimes referred to as the Greater Antilles, and the other West India islands, except the Bahamas, as the Lesser Antilles. Antilles is an Anglicized plural of Antilia, a name given on early maps to a mythical island in the Atlantic Ocean.

British West Indies. Islands of the West Indies which are dependencies in, or members of, the British Commonwealth of Nations. They may be divided into the following five groups: The Bahamas, Barbados, Jamaica and its dependencies, the Leeward Islands, and the Windward Islands. Trinidad and Tobago are sometimes added as a sixth group, but their proximity to South America makes it more natural to count them as insular parts of that continent. The total area of the islands is estimated at 12,000 square miles.

The chief occupation of the inhabitants is agriculture, although valuable hardwoods are to be found in the forested areas. English is the common language. The population, 1970, est., was 4,221,000.

Bahama Islands. A group of low islands in the British West Indies, extending from a point near the east coast of Florida, in a general direction parallel with the Cuban coast, to within 100 miles of the island of Hispaniola. While the group includes several hundred islands, only twenty have permanent settlements. These twenty cover an area of 4404 square miles. The population, in 1970, was estimated at 161,000. The islands are an independent nation within the commonwealth, with a capital at Nassau in New Providence island. The staple products are sponges and sisal hemp. Pineapples, both fresh and canned, oranges, and tomatoes are also exported.

Barbados. (*bär-bā'dōz*). The most easterly of the West India islands. The climate is healthful, fever being almost unknown. About two-thirds of its area of 166 square miles is under cultivation. The crop of paramount importance is sugar, exported chiefly to Canada and the United States.

The population in 1970 was 256,000. Washington's visit to Barbados in 1751 was the only foreign journey he ever made. It became an independent member of the British Commonwealth in 1966.

The capital and seaport is Bridgetown Its houses are built of coral rock and of wood. Pop., 1970 est., 238,000.

Jamaica. The largest island of the British West Indies, lying about 100 miles south of the eastern end of Cuba. Its area is 4411 square miles. Jamaica, including some smaller islands with a total area of 224 square miles, is an independent country within the British Commonwealth.

Jamaica is traversed by low hills, which, at the eastern end, culminate in the Blue Mountains with a maximum altitude of 7362 feet. The island is one of the world's largest sources of bauxite, some of which is processed locally into aluminum. Other exports include sugar, bananas, fruit juice, and rum.

The tourist trade is large. The population estimate in 1968 was 1,913,000.

The capital and chief port is Kingston, situated on a landlocked harbor on the southeast coast of the island. The city is well built. It has modern improvements and attractive suburbs. In one of its old parish churches stands the tomb of Admiral Benbow, an English seaman who distinguished himself in a battle with a French fleet in 1702. In 1907, Kingston was almost entirely destroyed by an earthquake. Pop., 1969 est., 1,972,130.

Leeward Islands. A group of West India islands forming a chain which begins to the east of Puerto Rico and curves southeast to the island of Saint Lucia. The majority of the islands are British. France, however, controls Guadeloupe, Martinique, Saint Bartholomew, and part of Saint Martin. The remainder of Saint Martin and the islands of Saint Eustatius and Saba belong to the Netherlands. The British dependencies are Antigua, Dominica, British Virgin islands, Saint Kitts, Montserrat, Barduda, Redonda, Sombrero, Nevis, and Anguilla. The British islands form one colony, having its seat of government at Saint John in the island of Antigua. The islands of the colony cover an approximate area of 428 square miles and support a population, principally Negroes, of more than 145,000. The chief articles of export are cotton, sugar, molasses, cocoa, limes, and coconuts. The name was given in allusion to the fact that the islands are not swept by the northeast trade winds as much as are the Windward Islands to the south.

Windward Islands. A group of British West India islands forming the eastern barrier of the Caribbean Sea, with a total area of 811 square miles. Population, 1970 est., 389,759. The four chief islands are Grenada, Saint Vincent, Saint Lucia, and Dominica. These islands have separate administrative bodies. The products include excellent grades of cotton and of arrowroot; also sugar, cocoa, lime juice, and spices. Most of the trade is with Great Britain.

Bermuda Islands. A group of low coral islands belonging to Great Britain, about 880 miles due east of Charleston, South Carolina, and 699 miles from New York. Twenty of the 150 islands are inhabited. They supported in 1970, on an area of 21 square miles, a population of 54,000. The chief exports are lilies and onions, sent almost entirely to the

United States. Hamilton, situated on Bermuda island, is the capital. During World War II the United States built a naval and air base at Bermuda under a 99-year lease. The climate is genial and attracts numerous visitors from the United States and from Great Britain. The islands are named after the Spaniard, Bermudez, who discovered them in 1515. They were first settled in the 17th century by Somers, an Englishman.

Cuba. The largest island of the West Indies, which, with the Isle of Pines and smaller adjacent islands, constitutes the independent republic of Cuba. Cuba is in the Torrid Zone and lies 92 miles south of Key West in Florida, the most southern town of the United States. The island has an average width of 50 miles and stretches about 730 miles in a general east and west direction. Its area is 44,206 square miles.

The surface of Cuba is in general low and undulating. Hills border the northern coast and in the southeast a short range of mountains, the Sierra Maestra, skirts the sea and reaches at one point an elevation of 8320 feet. The rivers are short. Many of them, however, are noted for disappearing throughout part of their courses. The Moa cascade in eastern Cuba is formed by a river which drops 300 feet into a cave. A number of springs of fresh water are found in the sea rising through the salt water. These are believed to be emerging rivers which disappeared inland.

The climate of Cuba is hot and moist. Improvements in sanitation have virtually banished yellow fever, which formerly afflicted the inhabitants as a yearly epidemic. The soil is rich and supports a luxuriant vegetation. Palms and valuable hardwood trees flourish in forests covering nearly half the island. Bananas and other tropical fruits provide food for the inhabitants and are exported in great quantities. The fauna includes the tarantula, chameleon, scorpion, vulture, scavenger buzzard, and, among the numerous species of snakes, a boa, which often attains a length of 18 feet. The rare insectivore, the almiqui, is indigenous to the island. Alligators infest the waters. Coral insects have produced coral reefs about the coasts in such number as to endanger navigation in many parts.

The chief industry of Cuba is the cultivation of sugar cane and of tobacco. Cuba leads the world in the production of sugar cane. After a Communist-type government was set up in 1959, all land and industries were nationalized. Sugar and other exports, which had gone chiefly to the United States, were taken under barter arrangements by Russia, China, and other Communist countries. Since that time, crops of rice, corn, and beans have increased markedly. Coffee also is an important crop. Rayon and cement are among recent manufactures. Sugar refining remains the leading industry; cigars and cigarettes rank second.

The population of Cuba, 1970 est., was 8,553,395. Spanish is the prevailing language, and the Roman Catholic religion predominates. In 1961, when education was nationalized, many Catholic schools were seized. Elementary education is free and obligatory from ages 6 to 14. There are many vocational schools and a national university. The capital is Havana.

Havana. The capital of Cuba, situated on an excellent natural harbor on the northern coast. The city lies directly south of Florida. Havana is the chief commercial city of the West Indies. It is the focus of Cuba's enormous trade in sugar and in tobacco, and has tobacco factories which are among the largest in the world.

The older section of the city, lying between the harbor and the sea, has narrow, irregular streets. The newer parts have wide, asphalt-paved streets and contain picturesque parks and promenades adorned with shade trees. The most attractive street is the Prado, which has in the center a parkway shaded by laurels and palms. Most of the public buildings are of limestone. They include the costly presidential palace, on the Prado; the Tacon theater, which is one of the largest playhouses in the western hemisphere; and the cathedral, said to have contained the remains of Columbus from 1796 to 1898. The city is a popular winter resort. The chief educational institutions include the University of Havana and the Jesuit College of Belen.

The harbor is equipped with three forts of obsolete construction. In 1898 the American battleship, the *Maine*, was blown up in the harbor. After the expulsion of the Spaniards in 1899, a program of improvements in sanitation was carried out which freed the city from the pestilential scourges to which it was formerly subject. Havana was founded in 1519. Population, 1970, 1,565,700.

Camagüey (*kă'mă-gwā'*). The largest inland city of Cuba, situated in the midst of rich savannas somewhat east of the center of the island. Its port, Nuevitas, located about 50 miles northeast on the Atlantic coast, is the outlet for the products of the live stock industry centering in the city. The sugar interests of Camagüey are also considerable.

Founded in 1516, the city retains an antiquated appearance with narrow, winding streets and poor houses. During the American occupation of Cuba, good water was provided by means of artesian wells and a drainage system was introduced. The city is sometimes known as Puerto Principe. Population, 1970, 170,500.

Cienfuegos (*syĕn-fwā'gōs*). A seaport of Cuba, situated on a landlocked harbor near the center of the island's southern coast. The commerce consists largely of sugar exports. Population, 99,530.

Matanzas (*mă-tăn'zăs*). A city on the northern coast of Cuba, 55 miles east of Havana. It has tobacco factories, distilleries, and iron foundries, and ranks next to Havana in the export of sugar and tobacco. Population, 82,619.

Santiago de Cuba (*săn'tê-ä'gō dā kōō'bă*). A city of southeastern Cuba, situated on a deep, landlocked harbor on the Caribbean Sea. The port is the outlet for the tobacco raised in the district, for forest products, and for iron, manganese, and copper ores. The city was founded in 1514 by Diego Velasquez. In the Spanish-American War, Spain's fleet under Cervera took refuge in Santiago harbor and was destroyed while attempting to escape. San Juan hill nearby is a national park memorializing Theodore Roosevelt's assault in 1898. Population, 1970, 249,600.

Hispaniola. The second largest island of the West Indies, a short distance southeast of Cuba. It is divided between two republics, Haiti and the Dominican Republic, which have a total population of more than 9,000,000. It was discovered on December 6, 1492, by Christopher Columbus, who named it La Española. It was later known as Haiti.

The island, about 405 miles long and 165 miles wide, has an area of about 29,400 square miles. The surface is rugged and has three mountain ranges running east and west. In the Dominican Republic is Hispaniola's highest peak, Pico Duarte, altitude 10,417 feet; a large salt lake, called Enriquillo; and a number of hot mineral springs. The mountains are rich in undeveloped mineral deposits. Abundant rainfall fosters luxuriant vegetation—valuable hardwood trees in the tropical forests, and, in the cultivated areas, large crops of coffee, cacao, cotton, tobacco, and sugar. Coffee is the chief export.

Haiti. A republic occupying the western third of the island of Hispaniola. Its area is 10,700 square miles. Most of the inhabitants live in the hot, unhealthful lowlands, and the death rate is high. The chief industry is the cultivation of coffee and other products of tropical agriculture. The mineral and forest wealth is little developed.

The population, 1970 estimate, was 4,867,000, of whom about 90 per cent have no admixture of white blood. The spoken language is a corrupt dialect of French known as Creole French. The official religion is Roman Catholicism.

The capital and largest city is Port au Prince, situated at the head of the Bay of Haiti. It has a population of about 250,000. It has a university, created in 1921. Port au Prince is sometimes called Port Républicain.

Dominican Republic. A republic of the West Indies, occupying the eastern two-thirds of the island of Hispaniola. Its 18,700 square miles have a subtropical climate.

The chief industry is agriculture. Sugar, cocoa, coffee, livestock products, and tobacco are exported, mainly to the U.S. Forest and mineral resources are extensive, but undeveloped. In 1968 several U.S., Japanese, and European companies formed a trust with the Dominican government to aid in technical training and industrial development.

The common language is Spanish, and Roman Catholicism is the prevailing religion. Customs collections from 1907 and the general administration of the country from 1916 were in the hands of the United States until 1934. The American receivership was abolished in 1941. Population, 1970, 4,325,000.

The capital is Santo Domingo (formerly Ciudad Trujillo) and is situated near the center of the republic's southern coast. The city had a cathedral, in which the bones of Christopher Columbus were entombed from 1542 to 1796, and a statue of him stands in the public square. The settlement was founded in 1496 by the brother of the great discoverer, and, after Isabela on the northern coast, it is the oldest European settlement in the western hemisphere. Population, 822,862.

Curaçao (*kōō'ră-sä'ō*). A political name applied to a Dutch colony which comprises two groups of islands in the West Indies. Curaçao, the largest island, and two others lie about 40 miles off the northwestern coast of Venezuela, while the remaining three form part of the Leeward Islands southeast of Puerto Rico. The total area of the colony is 403 square miles. Population, 1970 est., exceeded 220,000. The chief industry is oil refining. These islands, along with Surinam (formerly Dutch Guiana) were sometimes referred to as the Dutch West Indies.

SOUTH AMERICA

THE southern continent of the western hemisphere, situated, for the most part, south of the equator. It lies east of a line drawn directly south from Florida and extends east to a point about 1000 miles west of Africa's most western meridian. South America is joined to North America by a narrow isthmus, called Central America. The continent extends north and south a distance of about 4550 miles and has a maximum width of approximately 3200 miles. The area is slightly less than that of North America, being commonly estimated at 7,500,000 square miles.

Contour. In outline, the continent has a general resemblance to a triangle. It is widest in the north and tapers in the south to a point several hundred miles farther south than any other large body of habitable land in the world. The coast line is simple, having no major indentations, such as Hudson Bay in North America. There are, however, many small inlets, especially on the southwest coast of Chile, two large estuaries, that of the Amazon river and of the Plata river, and a number of bays and gulfs, of which the principal ones are: the Gulf of Guayaquil, Golfo Corcovado, and Golfo de Penas on the west; Bahia Grande, Gulf of Saint George, Golfo de San Matias, and Bahia Blanca, on the southeast; and on the north the Gulf of Paria and the Gulf of Venezuela, the latter being connected with the inland sea, Lake Maracaibo.

Surface and Drainage. Along the western side of the continent extends a continuous mountain system, known as the Cordillera of the Andes. This system differs from the Rocky Mountain system of North America in being higher and in containing a large number of volcanoes. Numerous short rivers flow down the narrow west incline of the Andes into the Pacific Ocean. On the east, the mountains slope rapidly down to three great plains drained by three of the greatest rivers of the world. The most northerly plain is the basin of the Orinoco River, a level, grass-covered stretch called the llanos. Separated from it by the plateau of Guiana are the silvas, the vast forested plain of the Amazon Valley. The llanos and the silvas drain to the east. The third great plain drains to the south. It is the basin of the Plata-Parana, consisting of undulating tracts, called pampas, adapted to pasturage.

The pampas are separated from the Amazon Valley by a low plateau, which, extending westward branches into a subdued mountain range skirting the Atlantic coast northeast almost to the Amazon and southwest to the mouth of the Plata. This range is cut in the north by a valley through which flows the Francisco river. South of the Plata-Parana River several streams drain into the Atlantic from the eastern slope of the Andes mountains. The largest of these are the Colorado River, the Rio Negro, and the Chubut River.

Islands. A number of islands are reckoned with the continent. In the southwest, numerous small islands are formed by the partially submerged Andes range. The group of islands at the extreme south is called the Archipelago of Tierra del Fuego and is separated from the continent by Magellan strait. Cape Horn is the most southerly of these islands and forms the most southerly point of the continent. The Galapagos islands lie about 600 miles off the Ecuador coast. The island of Trinidad is close to the delta of the Orinoco river. The Falkland Islands are situated about 350 miles east of the continent at its southern extremity.

Climate. The greater part of South America lies within the tropics. Over this region the moist trade winds blow westward from the Atlantic, providing the country with a copious rainfall as far west as the Andes range. Impinging on the mountains, the winds rise and become cooled, thereby losing their moisture, which is precipitated as rain. They descend as hot, dry winds on the Pacific Coast region, in which, consequently, desert conditions prevail. The Atacama desert in northern Chile is said to be the driest area in the world. Farther south, moist winds blow from the Pacific, giving the western slope of the Andes Mountains a heavy rainfall and rendering the pampas to the east a semi-desert country.

South America does not experience such extremes of temperature as does North America, except on the mountains. The temperature in the moist Amazon valley is consistently high, varying little from about 80° F. The southwestern coast similarly has a fairly constant temperature, but the dry region of the western coast and that of the pampas show greater variation. The mean winter temperature in parts of the south falls to 35° F. The hottest mean midsummer temperature is 85° F. and is found in northern Argentina. The higher mountain peaks, however, are snow-capped even under an equatorial sun.

Flora. The hot, moist region at the extreme north of the continent has a characteristic tropical vegetation. Palms, bamboos, and tree ferns are predominant, giving place to conifers on the mountains and to tall grass in the Orinoco River basin. The silvas of the Amazon valley form the largest heavily forested area in the world. The pampas are luxuriantly grassed in their northern portions, but in the south the aridity occasions a stunted vegetable growth. The potato is indigenous to the continent, which is also the world's chief source of coffee. Rubber and quinine come from the tropical forests, and the Temperate Zone region is one of the world's principal wheat growing and stock raising areas.

Fauna. The animal life of South America includes a number of characteristic species. Among them are alpacas, vicuñas, llamas, condors, tapirs, and a number of toothless quadrupeds—sloths, anteaters, armadillos, and bloodsucking bats. Llamas are used as beasts of burden in the mountains, and alpacas provide a superior quality of wool. Birds of brilliant plumage abound in the tropical regions; many monkeys and reptiles and innumerable species of insects and of fish are found, especially in the Amazon basin. The electric eel and the caribe, a savage fish, are among the more noteworthy.

Minerals. The mineral resources of the continent, although great, have been very imperfectly developed, largely on account of difficulties of transportation and of climate. The Cordillera of the Andes contains the bulk of such minerals, although many are found in the Brazilian plateau. Silver and gold were produced extensively before Europeans came to South America. Brazil was long the chief source of diamonds, and Chile exports nitrates to all parts of the world. South America is also the chief source of monazite and of vanadium. Immense quantities of oil come from Venezuela, copper from Chile, and tin from Bolivia. Aluminum ore comes from the Guianas, and platinum and emeralds from Colombia.

Inhabitants. The population of South America in 1969 exceeded 180 million. The largest city is Sao Paulo, with a population of 5,900,000. The majority of the continent's inhabitants are a mixture of white races with native Indians. Possibly one-fifth are pure Indians. Those of unmixed European origin are comparatively few, although they predominate in Argentina and comprise almost the whole of the population in Uruguay. Pure Indians predominate in Paraguay and Bolivia.

Most of the inhabitants speak Spanish, being descended from Spaniards, except in Brazil, where the European strain in the population is Portuguese and the Portuguese language is spoken. The Catholic religion prevails throughout the continent.

The Andes Mountains. The system of mountains running north and south on South America's western border. This system, wide and high in the northern and central part, where it divides into three chains, becomes narrower toward the south and gradually sinks to the level of the sea at the continent's southern extremity. The highest peak is Aconcagua, in west central Argentina, which reaches a height of 22,835 feet. Mt. Huascaran in Peru has an elevation of 22,205 feet. Several of the world's gigantic volcanoes belong to the Andes mountains, such as Chimborazo, Cotopaxi, Antisana, and Misti. Glaciers are found on the tall peaks, even those within the equatorial regions.

The continent's largest lake and one of the highest in the world, Lake Titicaca, lies among the Andes mountains at a level of about 12,500 feet above the sea. The lake, which has no outlet, has an area of 3200 square miles and a maximum depth of about 900 feet. Near its shores, there are many ruins of temples and other relics of a former civilization.

The Amazon River. The largest and one of the longest rivers of the world, draining a tropical basin in South America eastward from the Andes Mountains and emptying into the Atlantic Ocean through an estuary which expands to a width of 150 miles.

The river has several tributaries which are themselves among the major rivers of the world. The Rio Negro is the largest affluent on the north; on the south the chief tributaries are the Purus, the Tapajoz, the Xingu, the Araguaia, and the Madeira, the last of which has an affluent explored by Theodore Roosevelt and named, after him, the Roosevelt River.

The Amazon River is navigable for ocean steamers over a distance of 2300 miles, and 486 miles farther for smaller vessels. The river system affords navigable waterways of 27,000 miles.

Rising tides produce large tidal waves, or bores, which rush up the river with a loud roar and often endanger shipping. The effect of the river's current can be detected 200 miles out at sea. In the flood season the river rises 30 to 40 feet in some parts, inundating the banks for several months of the year.

Plata-Parana. The second largest river system of South America, consisting of the Parana River and the Uruguay River, which unite their streams in the Rio de la Plata, "Silver river," an estuary conducting the water of the system to the Atlantic Ocean, about 20° of latitude north of Cape Horn.

The basin has a southern drainage, sloping from the Brazil plateau in the north. The estuary is 135 miles wide at its outlet. The Plata-Parana stream measures altogether about 2500 miles, of which about 1200 miles are navigable. The chief tributary is the Paraguay river, which flows into the Parana.

Orinoco River. One of the three large rivers of South America, draining a tropical territory in the northern part of the continent. The river rises in the Parima Mountains between Venezuela and Brazil. After traversing immense flat, treeless plains in a course running first west, then north, and finally east, the river winds through a dense tropical forest area and empties into the Atlantic Ocean through several mouths forming a delta south of the island of Trinidad. About 150 miles from its source the river discharges part of its water into the Rio Negro, an affluent of the Amazon River. The Orinoco River is navigable to a cataract 870 miles from its mouth. Its tributaries are very numerous, the chief navigable ones being the Guaviare, the Meta, and the Apure. The system has 4300 miles of navigable streams. See *Venezuela*.

POLITICAL DIVISIONS

Located on the mainland of South America are the nations of Argentina, Bolivia, Brazil, Chile, Columbia, Ecuador, Guyana (formerly the colony of British Guiana and now an independent member of the Commonwealth), Paraguay, Peru, Surinam (formerly the colony of Dutch Guiana), Uruguay, and Venezuela—and the colony of French Guiana. Brazil has the largest land area and Surinam the smallest. Among the islands, Trinidad and Tobago are an independent member of the British Commonwealth, while the Falkland Islands are dependencies of Britain. The Galapagos Islands belong to Ecuador.

Argentina. The most highly developed country of South America and second largest in area, occupying the greater part of the southern portion of the continent. The country has an Atlantic seaboard of 1565 miles and a western land boundary of about 3000 miles, following the continental watershed formed by the Andes. Argentina measures about 2285 miles from north to south and has a maximum width of 930 miles, with an area of 1,084,120 square miles.

The country is drained in the north by the Plata-Parana River. In the south the surface slopes from the ridge of the Andes toward the Atlantic Ocean. The climate varies from the tropical warmth in the low plains of the north, where 120° F. has been recorded, to the more moderate conditions existing in the south, where 3° F. is the lowest temperature officially noted. The rainfall decreases from the eastern coast to the base of the Andes Mountains.

The flora of Argentina shows variations following the differences in climate. In the partly unexplored tropical forests of the north, algaroba trees are especially numerous, and many medicinal shrubs and other plants abound, including the *yerba maté*, or Paraguay tea plant. The mountains are wooded, those around the Strait of Magellan and Tierra del Fuego being covered with immense forests of beech. The most valuable product of the forest is quebracho extract, a dye. The pampas are treeless but are covered with grass. Such tropical and subtropical fruits as oranges, lemons, grapes, and peaches are grown. The animals characteristic of Argentina include the viscacha and the hare of Patagonia.

The chief industries of Argentina are grazing and agriculture, for which the extensive pampas are admirably suited. Wheat and corn are the most valuable crops. Grain and meat form more than 75 per cent of the exports. Argentina is the world's largest exporter of beef, corn, and flaxseed. Lumbering and mining are carried on to some extent. Oil fields yielded 123,076,000 barrels of petroleum in 1968. There are 27,301 miles of railway, all of which are now state property, a greater mileage than that of any other South American country.

Argentina is divided into 22 provinces and 1 federal district. The capital is Buenos Aires. The country has received a great many European immigrants, principally from Italy, Spain, and Germany. The Indian strain in the population is comparatively slight. The population, according to the 1970 estimate, was 24,352,000.

Bolivia. An inland country in the west central part of South America. The southwestern border follows the ridge of the western range of the Andean Cordillera, which in this section spreads out into the Bolivian plateau and occupies nearly half the surface of Bolivia. The average elevation of the plateau is 12,000 feet, but it contains some of the highest peaks of the continent, such as Ancohuma, Sajama, Illampu, and Illimani. In this plateau lies the lofty Lake Titicaca, with which is connected Lake Aullagas. East of the plateau, the surface slopes down in vast undulating plains toward the Amazon River valley in the north and, in the south, toward the llanos of the Parana River basin. The area of the country is estimated at 424,162 square miles.

LATIN AMERICA I

Buenos Aires, capital of Argentina, is the largest city in South America. This obelisk is a copy of that on the Rue de la Concorde, Paris.

This view of Juarez Avenue in Mexico City illustrates the typical broad avenues in the city's regular layout. Shaded boulevards, ornate squares, and numerous parks embellished with sculpture characterize this great city built more than a mile above sea level.

Right Machu Picchu, the "Lost City of the Incas," near Cuzco, Peru, where it is believed that survivors of the Spanish conquest took refuge and eluded the victors in this inaccessible fastness.

Braniff Airways

This is the Equator Monument at zero latitude in Ecuador. The northern hemisphere on the left, southern hemisphere is on the right.

Italian Museum, Lima, Peru, a gift of Lima's Italian citizens on the occasion of the centenary of Peru's independence in 1921.

Pan American Union

Many of the newer buildings in South America are daringly modern in design. This striking apartment house is in Montevideo, Uruguay.

LATIN AMERICA II

Christ of the Andes, a colossal statue on the Chile-Argentina border, celebrating settlement of an old dispute.

Pan American Airways

South American Indians still use primitive methods. This fishing boat on a high Andean lake is made of balsa wood, including the sail.

Altamira Plaza, in Caracas, reflects the spirit of progress in Venezuela and the increase in national wealth that has made possible many modern improvements.

Courtesy—Ministry of Development, Tourist Dept., Caracas, Venezuela

This shadowy, ancient street in La Paz, Bolivia, is typical of many old South American cities, where buildings hundreds of years old rub shoulders with modern architecture.

Modern and progressive, Sao Paulo, largest city in Brazil, is a leading manufacturing and business center.

Brazilian Gov't. Trade Bureau

Bolivia is entirely in the Torrid Zone, but the climate of the upland is of an almost arctic severity. Parts of this plateau support grazing flocks of sheep, llamas, and alpacas, but it is for the most part arid and of value only for its minerals. The fertile eastern slope of the Cordillera, being warmer and well watered, produces wheat, corn, barley, peaches, grapes, and figs. The lowlands support a tropical vegetation. Coffee, cacao, rice, sugar cane, and medicinal plants are cultivated, and vast forests yield rosewood, mahogany, ebony, cedar, and rubber, the last being produced in quantities which entitle Bolivia to rank next to Brazil as a rubber exporting country.

Bolivia's principal industry is mining, and the principal mineral product is tin, in the export of which Bolivia ranks second among the countries of the world. Silver, gold, and copper are also mined in large quantities, and wolfram, vanadium, bismuth, lead, zinc, salt, and antimony are obtained in smaller amounts. Potosi, where the tin and silver mining interests center, is the highest city in the world, having an elevation of 14,350 feet. At such an altitude, operations can be carried on only by the natives. Population, 1970 est. at more than 98,000.

Railroad transportation is limited by the natural obstacles in the way of construction. Some 2200 miles of track, however, are in operation. There is communication by airplane between the principal cities. Llamas are used for carrying light loads over mountainous districts.

The majority of the inhabitants live on the eastern slopes of the mountains. About one-half are pure Indians, and the white race forms about 12 per cent of the population of 5,600,000 (1975 est.). La Paz is the largest city and the seat of Congress, and Sucre is the statutory capital and seat of the supreme court. The country possesses many impressive remains of a vanished civilization. Bolivia was deprived of access to the sea by a disastrous war with Chile which ended in 1883.

Brazil. The largest country of South America, occupying the entire east central part of the continent and having a westward extension which reaches almost to the Andes Mountains. The country's maximum extent north and south is 2660 miles and east and west it measures about 2700 miles, with a total area of 3,289,000 square miles, exceeding that of continental United States.

In the north the climate is moist and tropical in character, while toward the south it becomes more temperate and the rainfall is lighter. The northern region is drained by the Amazon River, south of which lies one of the world's largest unexplored forest areas. The eastern part of the country is a highland through which the river Francisco flows, and the southern district is drained by the Uruguay River and by the upper reaches of the Parana River system.

The mineral resources of Brazil are very great but are largely undeveloped. The production of gold and of diamonds was formerly of great importance. The Morro Velho gold mine, having a depth of 7000 feet, is one of the deepest mines in the world. The deposits of iron are very extensive. Brazil provides the greater part of the world's supply of monazite.

The tropical flora of Brazil includes trees producing an extraordinary variety of useful and of ornamental woods, 200 different kinds of timber having been shown at the national exhibition in Rio de Janeiro in 1922. These woods include mahogany, rosewood, brazilwood, and logwood. The rubber tree and the pine are among those of the greatest commercial value. The rank forests of the Amazon basin abound in brilliantly colored flowers and in countless monkeys, lizards, fish, gaudy butterflies, and other tropical animals. The portions of the country farther south are suitable for agriculture, and produce a large amount of coffee, sugar, cocoa, tobacco, and cotton. About three-fourths of the world's supply of coffee comes from Brazil. The country continues to supply substantial quantities of rubber to world trade. Large areas provide fertile pasture land for raising livestock, notably Brahman cattle.

Brazil exports mainly the products of the forest and farm, and imports some manufactured goods. The textile industry includes the manufacture of silk, woolen, cotton, and jute goods. Other industries rapidly developing are ceramics, glass, electrical appliances, plastics, and cement. There are many tobacco factories and sugar refineries. Carnauba wax, produced only in Brazil, insures a high hard polish and long-wearing protection on furniture and floors.

The population of Brazil, according to the 1970 estimate, was 95,305,000, making the country the most populous in the western hemisphere after the United States. Many Negroes and about 100,000 Indians live in the Amazon valley. In the south there are a number of settlements of Germans, Spaniards, and Italians. The majority of the inhabitants, however, are of Portuguese origin, and the language of the country is Portuguese.

Politically, the country consists of 21 federated states, one federal district, and four territories. The most populous and most prosperous states are Bahia, Minas Gerais, and Sao Paulo, all bordering on the central part of the southeastern coast. These states produce the bulk of the minerals, coffee, sugar, cotton, and live stock. The most extensive state is Amazonas, occupying the upper Amazon valley. From it come most of the valuable woods. The largest city of the country is Sao Paulo and the capital is Brasilia. The port Pernambuco, on the eastern coast, is nearer to Lisbon than to New York.

Chile (*chĭl'ē*). A country of South America, lying on the western coast and extending, with an average width of about 87 miles, from the southern extremity of the continent northward about 2700 miles to Peru. The area is estimated at 286,397 square miles. The eastern boundary follows in general the ridge of the Andes mountains.

A high plateau rises abruptly from the sea along the greater part of the coast, leaving a lofty plain between the sea and the foot of the Andes. There is a gentle slope from the north to the south. The rivers are short and drain into the Pacific Ocean. A number of natural harbors are found among the fiordlike indentations and the numerous islands of the southern coast. The country is subject to severe earthquakes followed usually by destructive tidal waves. One of the most disastrous occurred in 1922. In 1751, the former city of Concepcion was sunk in the Pacific Ocean.

The climate of Chile is hot and extremely arid in the north, where a whole year often passes without rain. The central region, having a more moderate temperature and a greater precipitation, supports a flourishing agricultural industry and contains most of the population. In the south the increased rainfall permits the growth of forests of beech, cypress, and oak, the last of which has been introduced from abroad. In the extreme south the growth of the trees is stunted by the prevailing low temperatures.

The northern third of Chile is the world's chief source of natural nitrate of soda, which is used as a mineral fertilizer and in the production of explosives and of most of the world's supply of iodine. Chile is also one of the leading producers of copper. Other minerals mined in important quantities include iron ore, gold, silver, sulphur, borate, and salt. A large portion of the government's revenue is derived from the export of nitrate.

Agriculture provides employment for about half the population. The principal crops are grapes and wheat. Stock raising also is important. Most of the textiles and other manufactured goods consumed are imported. The United States and Great Britain receive most of the foreign trade.

Chile has a longitudinal railway system of some 6000 miles in length. The Trans-Andean railroad connects Valparaiso, on Chile's Pacific coast, with

the Atlantic seaboard at Buenos Aires. Parts of it climb grades of a steepness nowhere else attempted by railroad engineers. The total length is nearly 6000 miles. Air transportation is well developed.

The population of Chile in 1972 was 10,044,940, of whom about one fourth were of Spanish descent. The influence of the Church is greater than in most other countries of the continent. Chile has a powerful fleet and is politically one of the three strongest countries of South America. The capital and largest city is Santiago. Valparaiso is the chief port.

Colombia. A country of South America, occupying the extreme northwestern part of the continent. Colombia borders on the Pacific Ocean for a distance of about 500 miles and on the Caribbean Sea for 700 miles. Its area is 439,520 square miles.

The country is traversed from northeast to southwest by the Cordillera of the Andes, which here consists of a western, a central, and an eastern range separated by fertile plateaus. The eastern slope of the Cordillera drains in the north into the basin of the Orinoco river and, farther south, into the basin of the Amazon river. The central plateaus drain northward by the Magdalena River system into the Caribbean Sea. The western slope of the Cordillera has a number of short rivers emptying into the Pacific Ocean. The Magdalena river is navigable for steamers to La Dorada, a point about 560 miles above its mouth.

The climate of Colombia varies from the intense tropical heat of the coast regions, the valleys, and the llanos, to the temperate conditions of the plateaus and the mountains. There are two wet seasons and two dry seasons over most of the country. The llanos, however, have two seasons only. The rainfall there is deficient and does not permit the growth of trees. The west coast, however, has a large rainfall. The mountain sides are covered with forests of a tropical character, containing, among many other varieties of plants, the wax palm, the rubber tree, and several species of cinchonas.

The mineral wealth of Colombia is great. Gold, platinum, copper, petroleum, and emeralds are exported, the last being produced in Colombia in greater quantities than in the rest of the world. The salt mines are a government monopoly and provide a considerable part of the national revenue.

The chief industries are agriculture and stock raising. Temperate zone cereals are grown on the plateaus, and coffee, sugar, bananas, and cocoa are produced in the valleys and the lower regions. Colombia provides most of the world's supply of mild coffee. Panama hats are produced extensively, although the industry is not centralized in factories. In addition to coffee, the chief exports are petroleum, bananas, gold, and platinum. The bulk of the foreign trade is with the United States. The mountainous surface of the country and the prevalence of tropical forests make transportation difficult except on the rivers and by air. Overhead ropeways are also a feature of Colombia's transportation facilities.

Colombia is divided into 23 departments, 3 intendancies, and 5 commissaries. The capital and largest city is Bogota. The population of the country, 1972 estimate, was 23,210,000.

Ecuador. A country in the northwest portion of South America, bordering on the Pacific Ocean and stretching south from Colombia to Peru. Its area is estimated at 104,516 square miles. Ecuador's coast line is broken by the Gulf of Guayaquil, the only large inlet on the south side of the continent.

The country is traversed from north to south by two ranges of the Andean Cordillera. Between the ranges lies a plateau, which has an average elevation of 9000 feet but in the south falls to a level of about 2000 feet. This plateau contains most of the cultivated land and has a delightful climate. The mountain ranges have many peaks of exceptional height, including Cotopaxi, the world's loftiest active volcano.

The coastal strip in Ecuador is not an arid waste, as in Peru and northern Chile, but is a stretch of tropical jungle with an excessive rainfall. Dense forests are found on the mountain slopes both on the west and on the east of the Cordillera. The east slope gives rise to several navigable rivers of the Amazon basin. One of the largest is the Napo, down which the explorer Orellana sailed in 1541 to the mouth of the Amazon River.

The immense virgin forests of Ecuador yield rubber, ivory nuts, dyewoods, cinchona bark, and many valuable kinds of cabinet wood. The distinctive products of the country, however, are cocoa and toquilla. The latter is the fabric from which Panama hats are made. It is shipped extensively to Colombia where the actual weaving is an important industry. Other products of the tropical agriculture pursued on the coastal strip are coffee, tobacco, and sugar. In the plateau, hay, cereal crops, and fruits and vegetables of a temperate zone character are cultivated, and cattle are raised in large numbers. Alligator skins are exported. Gold and petroleum are produced and silver, copper, iron, lead, coal, and sulphur are found. The production of salt is a government monopoly.

The population, 1974 census, was 6,500,845, the great majority of whom are of Indian origin. The coinage of the country is minted in England and the United States. The country owns the Galapagos, or "turtle", islands, lying 600 miles to the west. The capital of Ecuador is Quito and the principal seaport and largest city is Guayaquil. The name of the country is the Spanish word for equator.

French Guiana. An overseas department in the French Community with an area of about 34,740 square miles in northeastern South America. It is bounded by the Atlantic Ocean, Brazil, and Surinam, and consists of two districts—Cayenne and Inini. Cayenne (the coastal strip 25 miles deep), along with Devil's Island and other islands, was used by France as a penal settlement from 1931 until 1944, when it was closed. Inini, the hinterland district, is rich in valuable hardwoods and has much mineral wealth, including gold, silver, iron, and phosphates. Corn, rice, bananas, and sugar cane are among the principal crops. The population of French Guiana was estimated to be about 44,200 in 1971, most of the people living in the coastal strip, Cayenne. The capital and chief port is also called Cayenne.

Guyana. A former British colony of continental South America, lying between Venezuela and Surinam near the center of the continent's northeastern coast line. Its area is 83,000 square miles. The interior is covered with dense forests as far as the highlands in the southwest. The rivers are not navigable, except for short distances, because of rapids and falls. In the Potaro River are the famous Kaieteur Falls, having a drop of about 800 feet. The coast district, about 40 miles wide, is low, and part of it is protected by dikes. It is very fertile and produces large crops of sugar cane, rice, and coconuts. Gold and diamonds are mined in the highlands. Bauxite, the ore of aluminum, is exported.

The climate of the country is generally hot and moist. It was estimated that the population in 1975 was more than 794,348, about one-half of whom are East Indians, who were brought in to work on the plantations. The capital is Georgetown. England's sovereignty over the colony was disputed by the Dutch and the French until 1815, when the territory finally passed into her possession. The Venezuelan boundary was fixed after a dispute arbitrated in 1899 by jurists of Great Britain and of the United States. Guyana became independent in May, 1966.

Paraguay. An inland country of central South America, bounded by Brazil, Argentina, and Bolivia.

Paraguay is a low-lying country situated between the Parana River and the Paraguay River, with the exception of a district to the northwest, the Gran Chaco. By arbitration with Bolivia in 1930, Paraguay received 91,800 square miles of the Gran Chaco, making her total area about 157,000 square miles.

Apart from the disputed territory, which is subject to alternate floods and droughts, the climate is delightful for the greater part of the year. During the three hottest months, however, the temperature not infrequently rises above 100° F. The rainfall is moderate, but sufficient to foster the growth of dense forests, and rich groves of tropical fruit, particularly oranges, bananas, and lemons. Fine cabinet timbers, dyewoods, drugs, gums, and oils are obtainable from the forests on the hills and in the valleys of the northeast part of the country. Occasional stretches of savannas afford rich pasturage, and flat marshes in the south are adapted to rice culture.

The chief cultivated plants are orange and other tropical fruit trees, corn, sugar cane, rice, tobacco, and cotton. Agricultural methods, however, are still primitive. *Yerba maté*, or Paraguay tea, found wild in great abundance and also cultivated to some extent, is exported. Stock raising is the second industry of the country. Iron, copper, manganese, and marble are to be found in the northeast of the country, but they are not mined extensively.

Transportation facilities for this land-locked country improved noticeably in 1968–69. A new highway to Brazil was completed, new roads were built, and a large hydroelectric project was begun. Access to the sea is by river navigation through Argentina and by a railroad service to Buenos Aires. Chief exports are oranges, tobacco, beef hides, quebracho logs and extract, and vegetable oil. Increased tourism has helped raise the country economically.

The population of Paraguay was estimated in 1972 to be 2,354,071, a very small proportion of whom are white, these being mainly Italian and German immigrants. The settlements are largely confined to the vicinity of the Paraguay River. About one-seventh of the inhabitants are pure Indians, and the native Guarani language is more widely used than Spanish. The percentage of illiteracy is high. The capital, chief port, and the largest city is Asuncion.

Peru. A country of west central South America, bordering on the Pacific Ocean and stretching northward from Chile to Ecuador. Its area is 496,223 square miles.

Peru is traversed from north to south by the Cordillera of the Andes, which, under the name of the Sierra or uplands, constitutes one of the three physiographical divisions of the country. The uplands consist of three ranges, ill defined in parts, and of the intervening plateaus. There are several large volcanoes in this region and violent earthquakes are not uncommon. The rainfall is unevenly distributed.

Between the foothills of the Andes and the Pacific Ocean is a dry coastal strip averaging about 30 miles in width. This strip is cut by several rivers, which foster vegetation along their banks and afford means of irrigation. The civilization of the country centers about these rivers. Sloping eastward from the uplands is the Montana, a forest area with a heavy rainfall, in which the Amazon River system takes its rise.

Peru lies wholly within the Torrid Zone. The climate is not oppressively hot, however, except in the eastern valleys and lowlands. The greater part of the Sierra enjoys an equable temperature, and the heat of the coastal strip is moderated by the antarctic currents. Dense fogs frequently hang over the coast.

The eastern part of the Montana, being hot and well watered, supports a tropical vegetation. The cinchona tree is native to Peru and rubber trees grow in abundance but are comparatively inaccessible. Peru is the chief source of the coca shrub, from which cocaine is obtained.

The watered sections of the Sierra and of the coastal area produce sugar and cotton. Other agricultural products include coffee, grapes, palms, cocoa, corn, and wheat. A large number of sheep are raised in the Sierra, and wool, taken in part from sheep but to a great extent from llamas and alpacas, is exported in large quantities. The llama is the principal beast of burden. Mules are used extensively for traveling, the railway mileage being small on account of the mountainous character of the country. The various lines embrace about 2800 miles of track.

Mining ranks second to agriculture among the industries. The chief minerals are petroleum, copper, and silver, but over four-fifths of the world's supply of vanadium comes from Peru. The chief manufactures are sugar and cocaine, other necessary industrial products, such as textiles, lumber, wheat, and coal being imported. Peru has an important fishing industry, the main catch being anchovies, most of which are made into fish meal for cattle and poultry feed. This makes fish meal the leading export, with copper second.

Peru is the seat of the vanished civilization of the Incas, by whom Cuzco is said to have been founded in the 10th century. The population, according to the latest estimate, was 15,400,000, about 53 per cent being white and mestizos, and 46 per cent Indian.

The capital and largest city is Lima. The chief port is Callao on the Pacific Ocean. The steamship service between Peruvian and Bolivian ports on Lake Titicaca is unique in operating at an altitude unequalled on any other navigable body of water. Iquitos, on the upper reaches of the Amazon river, has steamer connections with the Atlantic Ocean, 2500 miles distant.

Surinam. This former Dutch colony became fully independent in 1975. It is situated at the center of the continent's northeast coast between Guyana and French Guiana. Its area—54,291 square miles—makes it the smallest South American nation.

The cultivated area is confined to a coastal strip about 20 miles in width, the interior region being covered with a dense tropical forest as far as the highlands of the southeast. The chief agricultural products are bananas, sugar, cacao, coffee, and rice. Gold is exported also, much of it obtained from alluvium.

The estimated population in 1971 was 384,900, and consists largely of Negroes and people of East Indian origin, who were brought in to work on the plantations. The capital is Paramaribo. The name Surinam is a corruption of Surreyham, which was the original designation given in honor of the Earl of Surrey.

Uruguay. A country south of Brazil between the Atlantic Ocean and the Uruguay River. Its southern coastline is on the Rio de la Plata. The total area is 72,172 square miles.

The surface is rolling and has several chains of hills reaching a maximum elevation of 2000 feet. The climate is equable in the south, but in the north it becomes continental, admitting of greater heat in the summer and of occasional frosts in the winter. The northern hills and valleys are covered with a subtropical forest, while the south and east form extensive fertile plains suited for agriculture and for stock raising. Deer, otters, wild hogs, and wildcats are indigenous. Rheas, or American ostriches, are found; and fur seals, protected by the government, inhabit Lobas island and Castillos island near the coast. There are also storks, swans, cranes, and wild turkeys.

Stock raising is the principal industry of Uruguay, animal products forming nearly nine-tenths of the exports. Wheat, oats, flaxseed, and grapes are also grown and exported. Less than 10 per cent of the country's area, however, is devoted to agriculture, in spite of the fact that the government encourages the industry by supporting agricultural schools. Hailstorms, destructive hurricanes, and

occasional droughts occur as factors unfavorable to the raising of crops.

Gold mines are worked, and there are deposits of copper, iron, manganese, and lignite. Manufactures are very slightly developed, the population relying on importation for such industrial products as textiles and hardware. Transportation in Uruguay is facilitated by several hundred miles of navigable river streams and by more than 1700 miles of railway.

The population of Uruguay, according to the latest official estimate, was 2,763,964, of whom about nine-tenths are of European descent, mainly Spaniards and Italians. The earliest settlements were made by Spaniards in 1624 on the Rio Negro, a tributary of the Uruguay River. The capital, foreign port, and largest city is Montevideo.

Venezuela. The most northern country of South America, having a northern coast line of about 1700 miles on the Caribbean Sea and a land boundary separating the country from Guyana, Brazil, and Colombia. Its area, including the islands off the north coast, is 352,143 square miles.

Apart from the small basin of Lake Maracaibo in the northwest, Venezuela is drained by the Orinoco River system. This system flows eastward from the Andes mountains between the Guiana highlands to the south and a northeastern extension of the Andes mountains on the north, and enters the sea through a large estuary overgrown with a mangrove swamp. The upper portion of the river system traverses the llanos. A major irrigation project became a reality with the completion in 1968 of the Guri Dam, 512 feet high, located near the confluence of the Caroni and Orinoco rivers. The tributaries of the Orinoco are numerous and, with the main stream, provide the country with about 4000 miles of navigable waterways.

The climate in the lower levels of Venezuela is tropical but becomes temperate in the highlands and frigid on the higher mountain peaks. The rainfall is copious in the east and in the northwestern parts near the mountains. On the llanos the comparative dryness during one season of the year prevents the growth of trees.

The flora of the eastern lowlands and of the better watered territory in the northwest consists of tropical forests similar to those of the Amazon valley. The forests include many plants from which are available such products as rubber, vanilla, brazil nuts, dyewoods, and drugs. Grasses form the characteristic vegetation of the llanos. The fauna of Venezuela is tropical and rich, and includes such species as the howling monkey, the spectacled bear, the vampire bat, the flamingo and other brilliantly colored but usually songless birds, the anaconda and other snakes, a frog with a voice resembling a human shout, the electric eel, and the caribe.

Venezuela is rich in minerals. It ranks among the world's largest producers of petroleum. Also produced in quantity are gold, salt, and asphalt, the last being found in lakes containing extensive remains of prehistoric animals. Pearl fishing is an industry on a number of islands off the north coast.

In the northern and western parts of Venezuela, where most of the population is concentrated, agriculture is carried on, the chief products being coffee, sugar, and cocoa. Grazing is the chief industry on the llanos. Most of the foreign trade is with the United States.

The name Venezuela is Italian, meaning Little Venice. It was given by early Italian explorers who found, on Lake Maracaibo, an Indian tribe inhabiting huts which were supported by piles driven into the bed of the lake. Reminded of Venice, they gave the region its name.

Venezuela is divided into 20 states, 2 territories, and a federal district. The capital and largest city is Caracas. The 1971 estimated population was 10,721,522, excluding 31,800 Indians.

CHIEF CITIES AND OTHER PLACES OF INTEREST IN SOUTH AMERICA

The preceding articles on South America deal with the larger features of the continent. Other points of interest, including the principal cities, the national capitals, the trade centers, certain islands, and regions of especial note are covered below.

Asuncion (*ä-sōōn'syōn'*). The capital and metropolis of Paraguay, situated on the east bank of the Paraguay River in the west central part of the country. The city is the port and trading center of Paraguay, and is connected by railroad with Buenos Aires. It has foundries, shipyards, and distilleries. The exports include Paraguay tea and lace, the latter a beautiful product of the industry of Indian women. Population, 392,753.

Bahia (*bä-ē'ä*). A city of east central Brazil, picturesquely situated on a high peninsula which partly encloses an excellent natural harbor. Bahia, also called Salvador, is a notable port, shipping coffee, sugar, rubber, cotton, and other products raised in the state. The manufactures are varied, the principal one being cotton cloth. Bahia was formerly the center of the world's largest diamond trade.

The lower part of the city, devoted to commerce, has narrow streets. The upper, or residential, part is accessible by elevators and is attractively built. The churches are very numerous. The cathedral of the archbishop of Brazil is situated in Bahia and is one of the finest basilicas in Brazil. The city has a university, a medical college, and a museum. The culture of seedless oranges was introduced into the United States from Bahia. Founded in 1510 by Correa, a Portuguese navigator, the city was the capital of Brazil until 1763. Population, 863,000.

Barranquilla (*bär'rän-kēl'yä*). The chief port of Colombia, situated on the Magdalena River about 7½ miles from its mouth. The mouth of the river is not navigable. Traffic borne down the river to Barranquilla for export, therefore, is sent by rail to Puerto Colombia, a seaport on the Caribbean Sea. Population, 721,000.

Belem. A seaport of northeastern Brazil, situated on the Rio Para about 85 miles from the Atlantic Ocean. On the land side, it is flanked by dense forests. Belem is the headquarters for the navigation on the Amazon. Exports include cocoa, rice, cotton, rubber, and various forest products of the Amazon valley. Population, 633,000.

Bogota (*bō'gō-tä'*). The capital and largest city of Colombia, situated near the geographical center of the country on a fertile table-land at an elevation of about 8700 feet above the sea. There are many mountains in the vicinity and the mining interests of the city are considerable, the government's salt mines being a short distance north of the city. Coal, iron, and manganese mines lie to the north and east.

The more important edifices of Bogota include the government buildings and the cathedral, the latter being a structure in the Corinthian style of architecture. The city is the seat of the national university, of three endowed colleges, and of a museum containing many relics of the civilization of the Incas. The streets are narrow but well paved. Population, 2,978,000.

Brasilia (*brä-sēl'ē-ä*). Brazil's new capital, located in the Central Plateau in the state of Goias, is designed to integrate 6 million square kilometers of the interior into the general progress of the country. The city's daringly modern buildings are the work of sixty Brazilian architects. Population, 537,000.

Buenos Aires (*bwā'nōs ī'rās*; *bō'nůs ā'rēz*). The capital of Argentina and one of the largest cities in South America, situated on the south shore of the estuary of the Rio de la Plata about 170 miles from the Atlantic Ocean.

Buenos Aires handles the bulk of Argentina's foreign commerce and is one of the largest ports of the world, the harbor having been improved at a cost of about 50 million dollars. Near the wharves is the central fruit market, one of the largest warehouses in the world. The manufacturing industries produce mainly for home consumption.

The oldest part of Buenos Aires has narrow streets. The city is divided from east to west by the magnificent Avenida de Mayo, which is 100 feet wide and connects two beautiful squares. At the eastern end lies the Plaza de Mayo, having an area of more than four acres and fronted by several imposing buildings, including the executive palace and the cathedral. At the western end, the view terminates in the House of Congress, erected at a cost of $6 million. The office of the newspaper *La Prensa* is one of the most handsome buildings of the city.

Buenos Aires has a system of more than 100 parks which cover a total area of over 3000 acres. Numerous monuments have been erected in the city, including a statue of George Washington set up in Palmero park by American residents

of the city. The chief educational institution is the University of Buenos Aires.

Buenos Aires was founded by Pedro de Mendoza in 1535. It was destroyed by the Indians and was re-established in 1580 by Juan de Garay, the governor of Paraguay. The city has grown very rapidly in the past half century. Population, 2,966,816.

Callao (*kăl-yä′ō*). The principal seaport of Peru, situated on an island-sheltered bay near the center of the country's Pacific coast line. The city is connected by steam and electric railroads with Lima, distant seven miles inland. The chief exports are sugar, cotton, cocaine, minerals, and wool. In 1746 the former city of Callao was submerged with all its inhabitants, and on calm days the ruins are still distinguishable under water. Population, 335,000.

Cape Horn. The most southerly point of South America. The name is applied to a small, rocky island and to the most southerly point of the island, a headland having a height of 600 feet. The cape was discovered by the Dutch navigator, Schouten, who named it after Hoorn, his native town in the Netherlands.

Caracas (*kä-rä′käs*). The capital and largest city of Venezuela, occupying a mountainous site 7 miles from La Guaira, a port near the center of the country's northern coast. The city is an important exporting center for cocoa, coffee, tobacco, and other products of the country. Its principal square contains a large statue of Bolivar. The capitol building covers an area of two acres. The city has all modern improvements. An earthquake in 1812 killed more than 12,000 inhabitants. Population, 1,764,274.

Cayenne (*kä-ĕn′*; *kī-ĕn′*). A fortified seaport, the capital of the colony of French Guiana. The town is built on a low island between the Cayenne River and the Mahury River. The harbor is insecure and shallow. Sugar, gold, hides, woods, spices, and cacao are the principal exports. Thirty miles northwest is the Isle du Diable, "Devil's island," where Captain Dreyfus was imprisoned from 1894 to 1899. Population, 24,000.

Christ of the Andes. A bronze statue of Christ, by Mateo Alonzo, on the border of Chile and Argentina erected to commemorate the peaceful settlement in 1902 of a boundary dispute between the two countries. The statue, more than twice life-size, stands on a pedestal roughhewn from the natural rock near the summit of Uspallata Pass in the Andes at an altitude of 12,796 feet. It was cast from bronze obtained by melting cannon.

Cordoba (*kôr′dô-bä*). A commercial city of central Argentina, situated on the Rio Primero, about 400 miles northwest of Buenos Aires. Live stock, wool, and hides are shipped from this city. Cordoba has a cathedral, a massive Jesuit Church, a National Observatory, two national colleges, and a university, the last founded in 1613. The city dates back to the year 1573. It was formerly the head of the Jesuit missions in South America. Population, 589,153.

Easter Island. An island possession of Chile, lying about 2000 miles to the west in the Pacific Ocean. It contains many colossal stone images, which, according to archaeological evidence, were carved during several centuries after 1100 A.D. Masonry remains go back to about 300 A.D. When Easter Island was discovered by the Dutch captain Roggeveen on Easter Sunday, 1722, it had a population of about 4000, probably of Polynesian origin. Present inhabitants number about 1135. Its area is 45 square miles.

Falkland Islands. A group of about 100 small islands, forming a British crown colony situated in the south Atlantic Ocean, about 300 miles east of the Strait of Magellan. Only two of the islands are inhabited—East Falkland, with an area of 2610 square miles, and West Falkland, having 2090 square miles of surface.

The surface of the larger islands is treeless. Sheep farming was formerly the chief industry, but in recent years whaling has become more important. The climate is equable but cool and damp. South Georgia, the South Orkneys, the South Shetlands, the Sandwich group, and Graham's Land, all lying some hundreds of miles to the southeast, are regarded as dependencies of the Falkland Islands. In 1967 the population of the islands was about 2122. The capital is Stanley, East Falkland. During World War I, a British fleet defeated a German fleet near these islands.

Galapagos (*gä-lä′pä-gôs*) **Islands.** A group of small volcanic islands, sometimes called the Colon Archipelago, lying about 600 miles west of the coast of Ecuador. They have an estimated area of 2868 square miles and a population of about 2412. Politically, they are a dependency of Ecuador. The United States has a naval base there.

The name means turtle islands, and was given because of the prevalence of large turtles described in 1858 by Darwin as capable of carrying several men on their backs. The flora and fauna are distinctive, about one-half of the species of plants being found nowhere else.

Georgetown. The capital and seaport of Guyana, situated near the center of the nation's coast line. The city lies at the mouth of the Demarara river, which can be entered, however, by boats of light draft only. The chief exports are sugar, rice, coconuts, bauxite, gold, and diamonds. The streets cross each other at right angles. Some are 100 feet wide and have, in the center canals leading to the roadways. Most of the better residences are surrounded by private groves of palms and other forest trees. Population, 167,000.

Guayaquil (*gwī′ä-kēl′*). The largest city and chief port of Ecuador, situated on the Guayas River about 30 miles from its mouth in the Gulf of Guayaquil. The principal export is cocoa. The climate is hot and unhealthful. Manufactures, including lumber, machine shop products, and artificial ice, are mainly for local consumption. Population, 814,000.

Juan Fernandez Islands. A group of islands belonging to Chile in the Pacific Ocean, lying 400 miles west of Valparaiso. Alexander Selkirk lived here in solitude for four years. This fact is said to have suggested to Defoe the theme of *Robinson Crusoe*.

La Paz (*lä päs′*). The largest city of Bolivia and the seat of Congress, situated in the west central part of the country about 40 miles southeast of Lake Titicaca. The city has an elevation of 12,470 feet and is flanked by ranges of the Andes mountains. It is connected with the sea by two railroads, terminating at ports in Chile. The streets are narrow and irregular. There are, however, fine public promenades, a university, and a museum containing a valuable collection of Inca antiquities. Population, 697,000.

Lima (*lē′mä*). The capital of Peru. It is situated in the west central part of the country on the Rimac River seven miles from Callao, its port, with which it is connected by two railroads, one on each side of the river. Lima is the western terminus of a transcontinental railroad which, at one point, is 15,000 feet above the sea. Earthquakes have destroyed large parts of the city a number of times.

There are several beautiful squares and promenades lined with trees and flowering plants and ornamented with statues and fountains. The University of San Marcos, founded here in 1551, is the oldest university in the western hemisphere. Of the numerous churches, the largest and finest one is the cathedral. It contains the tomb of Pizarro, the founder of the city. The manufactures include textiles, leather, furniture, cement, chemicals, and rubber, aluminum, tobacco, and petroleum products.

During the war between Chile and Peru, the Chileans held Lima from 1881 to 1883 and in that time destroyed the national library and many monuments, statues, and other works of art. This city was the home of Saint Rose of Lima, the first native inhabitant of the Americas to be canonized. Population, 3,318,000.

Manaus (*mä-nä′ŭs*). A city of Brazil on the Rio Negro, 12 miles above its junction with the Amazon and about 1000 miles from the Atlantic. Manaus is the trading metropolis of the upper Amazon valley, upon which it draws for such articles of export as rubber, brazil nuts, and dyewoods. Manaus became the capital of the city of Amazonas in 1852. Population, 312,000.

Montevideo (*mŏn′tē-vĭd′ē-ō*). The capital and chief city of Uruguay, situated on a chain of hills overlooking a harbor on the north side of the Rio de la Plata.

The principal streets are wide and straight, and the city bears, in general, a European appearance, having all the modern municipal improvements and many fine residences. The Cagancha Plaza and the Solis Theater are among its more notable features. An equable climate makes possible an extensive cultivation of roses.

The city is cosmopolitan and handles all the foreign trade of the country. The chief industries are those connected with stock raising—the drying and packing of meats, and creamery and tannery operations. Montevideo is the seat of a military college and of the University of Uruguay. The name is a corruption of *montem video*, "I see the mountain," said in allusion to the Cerro, a picturesque mountain on the opposite side of the city's harbor. Population, 1,230,000.

Paramaribo (*pär′ä-măr′ĭ-bō*). The capital of Surinam, situated at the head of navigation on the Surinam River 16 miles from its mouth in the Atlantic Ocean. The climate is very hot, the mean yearly temperature being over 80° F. The town has regularly laid out streets, shaded by tamarind and orange trees and bordered by well built houses. A commodious harbor lined with wharves enables the handling of international commerce, most of which is

with the Netherlands, Great Britain, and the United States. The chief exports are rice, sugar, rum, coffee, bananas, and gold. Population, about 102,000.

Patagonia. A name formerly applied to the portion of South America stretching from the Strait of Magellan about 1200 miles north to the latitude of the Rio Negro. It was claimed both by Argentina and by Chile, and was divided between them in 1881 by a line of demarcation following the ridge of the Andes mountains. From that time the name has been restricted to southern Argentina, the part of the disputed territory sloping in terraces eastward from the mountains to the Atlantic Ocean.

Port of Spain. The capital of Trinidad and Tobago, situated in the northwest extremity of Trinidad. It has a fine harbor, and a large part of the products of the Orinoco basin are shipped from the port. The streets are wide and there are a number of fine residences and public buildings; also a university and a botanical garden. Population, 62,680.

Punta Arenas (*pōōn'tä ä-rā'näs*). The most southerly city in the world, a port in southern Chile on the Strait of Magellan. Surrounded by plains affording excellent grazing, it was the point where sheep-raising was first introduced into South America from the Falkland Islands and it is still an important center of sheep raising. It serves also as a fueling harbor for ships. Population, 67,600.

Quito (*kē'tō*). The capital of Ecuador, situated in a mountainous plateau somewhat north of the country's geographical center and about 114 miles from the Pacific Ocean. The city is less than ten miles south of the equator, but its climate is rendered equable by its elevation of 9000 feet. It is built at the foot of a volcano and is traversed by two deep ravines.

Quito was very difficult of access until the completion in 1903 of a railroad connecting the city with tidewater near Guayaquil. There is a university, an astronomical observatory, and a botanical garden which has the distinction of being the highest in the world. Quito was the central town of an ancient Indian nation until it was taken by the Incas in 1470. It was captured from the Incas by the Spaniards in 1534. Population, 557,000.

Recife (*rā-sē'fĕ*) (**Pernambuco**). A commercial city and port of Brazil situated on the Atlantic Coast at the extreme eastern point of the continent. The harbor is protected from the sea by a long reef and by a breakwater constructed at a cost of about 28 million dollars. Its distance from Lisbon is less than that between New York and Lisbon. The chief exports are sugar and cotton. The imports are mainly foodstuffs, textiles, and iron products.

The city consists of three parts, one built on a peninsula, one on an island, and a third, a pleasant residential section on the continent. Recife is therefore often called the Venice of South America. The climate is tropical.

The city has many fine churches and a celebrated law school. The name Recife means "reef." The first settlement on the site was made in 1535 by Pereira, a Portuguese adventurer. Population, 1,056,000.

Rio de Janeiro (*rē'ō dā zhä-nā'rō*). The second largest city of Brazil, situated on a natural harbor near the center of the country's southeastern coast. Spurs from nearby mountains penetrate into the heart of the city, which spreads into the valleys and up the hillsides. Sugarloaf peak rises abruptly above the city.

The interests of Rio de Janeiro are chiefly commercial. The leading export is coffee and the principal imports include cereals, coal, textiles, and machinery. Manufactures are confined mainly to textiles and flour.

Many of the streets in the older section of Rio de Janeiro are too narrow for wheeled vehicles. The newer portions, however, have wide, well paved avenues adorned with tall palm trees. Avenida Beira-Mar, a beautiful 20-mile boulevard, skirts the edge of the harbor. On the Avenida Presidente Wilson stands a colossal bronze figure representing Amicitia, "friendship," which was presented by the government of the United States. At the base of the pedestal are four statues representing Washington, Lincoln, Bonifacio, and Branco. On Corcovado Mountain, above the city, stands a statue of Christ, 130 feet in height.

There are several fine parks and squares. The Praça 15 de Novembro is surrounded by imposing buildings, among which are the Senate house and the city hall. In the neighborhood is the former Imperial Palace, occupied from 1808 to 1821 by the court of Portugal and now used as a national museum. Other institutions of education and research include the national library, the botanical garden, the historical and geographic institute, the observatory, and the University of Rio de Janeiro. The city was founded by Portuguese colonists in 1567 and from 1762 to 1960 it was the capital of Brazil. Population, 4,252,000.

Rosario (*rō-sä'rē-ō*). A commercial city of Argentina, situated on the left bank of the Parana River, about 230 miles above Buenos Aires. Rosario is the trade center for northern Argentina, being served by six railroads which connect at the city with ocean steamers. The chief exports are wheat and animal products, and the imports consist mainly of manufactured goods, mostly textiles. The city has modern improvements and attractive residential districts. Population, 807,000.

Santiago (*sän'tē-ä'gō*). The capital and largest city of Chile, situated near the center of the country about 50 miles from the Pacific Coast. The city lies at the northern edge of a rich agricultural district for which it is a distributing point and market.

Santiago's location is highly picturesque by reason of the surrounding mountains. A rock within the city, over 200 feet in height, once used as a citadel and a refuge from attacking Indians, is now a park, irrigated and supporting a luxuriant growth of vegetation. The city is traversed by a wide, ornate boulevard, the Avenida de las Delicias, which has a width of more than 300 feet.

Among the city's more impressive buildings are the exposition palace, the hall of Congress, the municipal theater, the cathedral, and the university building. At the head of the institutions of education and research stand the University of Chile and the agricultural school farm, an institution which embraces a zoological garden, a museum of natural history, and various schools for teaching different branches of rural industry. The city was founded in 1541 by Pedro de Valdivia. Population, 3,700,000.

Santos (*sänn'tōōsh*). A large seaport of Brazil, situated on Santos Bay on the Atlantic Coast about 200 miles southwest of Rio de Janeiro. Santos is the world's largest coffee shipping port, being the outlet for the coffee collected at Sao Paulo. Population, 300,000.

Sao Paulo (*sounm pou'lōō*). The capital of the state of Sao Paulo and largest city in Brazil, situated in the southeastern part of the state 25 miles inland from Santos, its port on the Atlantic Ocean. The city is the headquarters of the country's vast coffee industry. The coffee is transported from the plantations by a network of railroads leading to Sao Paulo, whence it is sent on by rail to Santos.

Among the more imposing buildings are the cathedral, the government building, and the Ypiranga palace, erected to commemorate Brazil's declaration of independence. The city has a modern appearance, having grown very rapidly in the decades following 1900, when numerous immigrants were attracted to it. Population, 5,900,000.

Sucre (*sōō'krā*). The statutory capital of Bolivia and the seat of the supreme court, picturesquely situated on a wide plateau about 150 miles south of the country's geographical center. The city is a trade center for a rich agricultural and mining region and has rail connection with La Paz, and with Mollendo and Antofagasta on the Pacific Coast. Sucre is the seat of an archbishop and has a normal school and an ancient university. Since 1898 Congress has met at La Paz. The city is 9328 feet above the level of the sea. Population, 88,000.

Trinidad and Tobago. Two islands constituting a member state of the British Commonwealth of Nations. Trinidad is about ten miles off the northeast coast of Venezuela near the delta of the Orinoco River, and the small island of Tobago is 22 miles northwest of Trinidad.

Trinidad has an area of 1864 square miles; that of Tobago is 116 square miles. The interior of Trinidad is a series of rolling, fertile, well watered plains, partly covered by forests of palms, breadfruits, tamarinds, and bamboo trees. Low mountain ranges parallel the north and the south coast. Tobago is a single mountain mass rising to a height of 1800 feet and covered with dense forest.

The most valuable products include petroleum, asphalt, sugar, cocoa, coconuts, and lumber. The asphalt comes mainly from a 114-acre reservoir known as Pitch Lake. The trade is principally with Great Britain and the United States.

Negroes and people of East Indian origin make up the majority of the population, which in 1973 was 1,061,000. Columbus discovered Trinidad in 1496 and Tobago in 1498. They passed from Spanish into British possession early in the 19th century, were colonies, later consolidated, and, in 1962, became an independent member of the British Commonwealth.

Valparaiso (*väl'pä-rī'sō*). The chief seaport of Chile, situated on a bay at the approximate center of Chile's coast line. The port is strongly fortified. The chief imports are textiles and other manufactured goods. The leading articles of export include agricultural products and Chile saltpeter. Its trade increased considerably as a result of the opening of the Panama Canal.

The city was one of the first in South America to introduce the use of street cars, of gas, and of aqueducts for the water supply. There are a number of wide streets and a fine square adorned with many statues. Population, 296,000.

EUROPE

THE continent consisting of the northwestern portion of the vast land surface in the eastern hemisphere. Europe may be regarded as a western peninsula of Asia, from which it is divided, more or less arbitrarily, by the Ural mountains, the Caspian Sea, the Caucasus mountains, the Black Sea, the Bosporus strait, the Sea of Marmora, the Dardanelles strait, and the Ægean Sea. To the south of Europe lies the Mediterranean Sea, which separates the continent from Africa. This inland sea communicates with the Atlantic Ocean by the Strait of Gibraltar, where Europe's most southern point, Cape Tarifa, is no more than nine miles from Africa's northern extremity. The continent is bounded by the Atlantic Ocean on the west and by the Arctic Ocean on the north. The continental part of Europe, as distinct from the islands, is often referred to as "the continent" by people in the British Isles and in America.

Size. With the exception of Australia, Europe is the smallest of the continents, covering about 3,900,000 square miles, or very little more than the area of the United States and Alaska. It includes, with all its outlying islands, little more than 7 per cent of the total land surface of the globe. Its greatest length from east to west is 3300 miles, and its maximum extent north and south is about 2400 miles.

Outline and Islands. Europe has a contour diversified by so many irregularities, great and small, that the coast line, winding about all the indentations of the mainland and of the chief islands, has a length of nearly 48,000 miles. The islands and peninsulas, occupying about one-third of the total area of the continent, partially enclose a number of large gulfs and inland seas. Thus, while the small inlets provide numerous harbors, the inland seas make all parts of the continent comparatively easy of access from the sea.

In the extreme northeast, the islands of Nova Zembla separate the Kara Sea from Barents Sea, the latter being shut off from the Arctic Ocean by the islands of Spitsbergen. From the southwest corner of Barents Sea, a strait, called the Gorlo, leads into the White Sea, a three-pronged gulf sheltered behind the Kola peninsula. The Kola peninsula is, itself, part of the huge Scandinavian peninsula, which encloses the Baltic Sea and its three major inlets, the Gulf of Bothnia, the Gulf of Finland, and the Gulf of Riga. The Scandinavian peninsula trends in a general southwestern direction and terminates in two diverging extensions, which open like jaws above the peninsula of Jutland and are separated from it by two straits, the Kattegat and the Skagerrack. The Jutland peninsula and part of the Scandinavian peninsula form the eastern shore of the North Sea, which, stretching westward to the British Isles, has a southwestern outlet through the English channel to the Atlantic Ocean. The British Isles consist of two principal islands, Great Britain and Ireland, separated by the Irish Sea. Dunmore Head on the southwestern coast of Ireland is the most westerly point of Europe. The Bay of Biscay is the only large western inlet.

The southern coast has three major peninsulas—the Iberian peninsula, Italy, and the Balkan peninsula. Between the Iberian peninsula and Italy, in the Mediterranean Sea, lie the Balearic islands, and the three islands—Corsica, Sardinia, and Sicily—which, with Italy, enclose the Tyrrhenian Sea. The Gulf of Taranto stretches inland between the toe and the heel of the bootlike peninsula of Italy, and the whole peninsula is separated by the Adriatic Sea from the Balkan peninsula, which, on its eastern side, is washed by the Ægean Sea, the Black Sea, and the smaller bodies of water connecting the two. The Ægean Sea is dotted with small islands, most of which cluster in archipelagoes known as the Cyclades and the Sporades.

At a distance from the continent, about 700 miles northwest of the Scandinavian peninsula, lies the large mountainous island of Iceland.

Surface. The average elevation of Europe is less than that of any other continent. The highest point is Mount Elbrus, in the Caucasus range, the peak of which reaches a height of 18,481 feet. Marked changes in land level at the coast have been observed within historical times. The land about the Gulf of Bothnia has risen, and the southern shore of the North Sea has subsided. On the eastern side of the Adriatic Sea near modern Rovigno, the island town of Cissa, which was flourishing in the 7th century, is now 85 feet below the sea.

Apart from the Ural and the Caucasus range, there are two chief systems of mountains in Europe—the Kiolen range, forming a longitudinal ridge in the Scandinavian peninsula, and an irregular group of ranges trending in a general east and west direction across southern Europe. This latter group consists of the Pyrenees range, which cuts across the neck of the peninsula of Spain; the Alps, forming a central highland north of Italy; the Apennines, extending to the southern extremity of Italy and finding a continuation in the mountainous regions of Sicily; the Carpathian mountains, extending northeast of the Alps for some distance and then turning southeast toward the Black Sea; the Pindus range, which forms the backbone of Greece; and the Balkan mountains passing eastward north of the Ægean Sea. Other mountainous regions are Iceland, Scotland, and Spain.

Volcanic activity is confined to Iceland and to the Mediterranean region and is most marked in southern Italy, Sicily, and the adjacent islands. Here are situated Mount Stromboli, Mount Etna, and Mount Vesuvius, the last being notable for the eruption which, in 79 A. D., buried the cities of Herculaneum and Pompeii. No part of the continent, however, is free of earthquakes except the great plains of Russia.

A large part of Europe's area consists of fertile plains. Western and northern France, northern Germany, and almost the whole of European Russia constitute what is sometimes called the Great Lowland Plain. Other plains are the Central Plain, occupying Ireland and England; the Plain of Lombardy, south of the Alps; the Hungarian Plain, hemmed in by the Carpathian mountains and by the highland extending from the Alps southeastward into Greece; and the Wallachian Plain, between the southern Carpathians and the Black Sea.

Drainage. Of the many rivers of Europe, only one, the Volga, is more than 2000 miles in length, and, of the others, only the Danube, the Dnieper, and the Don exceed a length of 1000 miles. With few exceptions, however, the rivers admit of navigation and contribute toward making the interior of the continent readily accessible from the coasts.

The chief rivers draining northward, named in order from east to west, are the Pechora, the Dvina, the Duna, the Vistula, the Oder, the Elbe, the Rhine, and the Seine. The Loire and the Gironde River system flow westward into the Bay of Biscay. The plateau of Spain is drained toward the Atlantic Ocean by the Douro, the Tagus, the Guadiana, and the Guadalquivir and, toward the Mediterranean Sea, by the Jucar and the Ebro river. Of the rivers of southern drainage, the Rhone flows into the Golfe du Lion, an inlet of the Mediterranean Sea; the Po, into the Adriatic Sea; the Danube, the Dniester, and the Dnieper, into the Black Sea; the Don, into the Sea of Azof, a northern inlet of the Black Sea; and the Volga, into the Caspian Sea.

Fresh-water lakes are particularly numerous in three regions—the highlands of the Alps, the British Isles, and the territory east and northwest of the Baltic Sea. The last-mentioned region contains by far the most lakes, including the two largest of the continent—Ladoga and Onega.

Climate. Europe lies almost entirely in the temperate zone, a small portion only projecting into the arctic region. The northern part, however, has a warmer climate than other regions of the same latitude on account of warm ocean currents which wash its shores. The southern limit of drift ice from the polar regions nowhere approaches within 50 miles of the Scandinavian peninsula. The northern interior plains, however, suffer much greater extremes of temperature than those occurring near the coast. The southern part of Europe has a subtropical climate.

Europe is the only continent which has no desert region. Warm, moisture-laden winds blow prevailingly from the southwest. In the absence of a mountain wall running north and south, these winds carry their moisture far inland, instead of being intercepted and losing it by precipitation near the coast.

Plant and Animal Life. There are three chief plant regions in Europe—the arctic, possessing scanty vegetation; the intermediate, comprising forest areas,—largely coniferous,—and level steppes which resemble the North American plains; and, lastly, the Mediterranean region in the south. The last is noted for the great variety and economic importance of its flora.

Next to Asia, Europe has contributed to the human race more cultivated plants than any other continent. The more important include, among the grains, oats and rye; among the vegetables, asparagus, beet, cabbage, carrot, endive, horseradish, lettuce, pea, and turnip; the forage plants, clover and timothy; and such fruits as the currant, gooseberry, and fig.

The fauna likewise is rich. It has a general similarity to that of North America. The characteristic mammals include the bear, lynx, badger, wolf, fox, otter, marten, ermine, polecat, squirrel, hedgehog, and rabbit. The desman and chamois are peculiar to the continent. In the south, the fallow deer, ibex, alpine marmot, and civet are found. Of the domesticated animals, Europe is the original home of the goose, pigeon, rabbit, reindeer, and swan.

Minerals. The geology of Europe reveals an immense wealth of mineral resources. Coal and iron are produced in the greatest aggregate value. The chief coal fields are those in Great Britain, in Upper Silesia, in the Ruhr district in Germany, in northeastern France, and in Russia. The Lorraine district in France, the Saar valley in Germany, and northern and central England are the most important iron producing regions. Spain and Upper Silesia produce the world's chief supply of zinc, as Russia does of platinum. Spain and Italy supply a large part of the world's market for quicksilver. Gold and asbestos are obtained from the Ural Mountain region in large quantities. Other mineral products of the continent include salt, sulphur, silver, lead, aluminum tin, copper, and marble.

Industry. The industrial output of Europe exceeds that of any other continent. Industrial development, however, is concentrated largely in a few regions, chiefly those where coal and iron are found in close proximity. Among the principal industries are those making steel, fertilizers and other chemicals, glass, pottery, perfumes, and scientific instruments. There are also many highly specialized products exported, such as art objects, specially designed clothing, and time pieces.

Inhabitants. Human habitation in Europe is very ancient. In various districts, remains of prehistoric men have been found, the earliest going back probably 250,000 years to the second interglacial period. The population of Europe, now numbers over 500 million. With few exceptions, the languages of Europe belong to one family, called by philologists Indo-European. Peoples of Asia speaking related languages are believed to have migrated from Europe to Asia. Counter migrations from Asia brought some Oriental types into Europe, such as the Magyars and Huns.

POLITICAL DIVISIONS

Europe has more old established countries than any other continent. The countries are: Albania, Andorra, Austria, Belgium, Bulgaria, Denmark, Finland, France, Germany, Great Britain and Northern Ireland, Greece, Hungary, Iceland, Eire, Italy, Liechtenstein, Luxembourg, Monaco, the Netherlands, Norway, Poland, Portugal, Rumania, Russia, San Marino, Spain, Sweden, Switzerland, Vatican City, and Yugoslavia.

Of these divisions, Eire is a part of the island of Ireland, and its geography, along with that of Northern Ireland, is treated under the head of Ireland. Vatican City is 109 acres of papal territory within the city of Rome. Andorra is a mountainous, pastoral country between France and Spain; Luxembourg is surrounded by France, Germany, and Belgium; and Liechtenstein is a small principality hemmed in by Austria and Switzerland. These countries, as well as San Marino, an ancient state surrounded by Italian territory in the northeastern part of the peninsula, will be found described from a geographical point of view in the departments of history and government.

In addition to the independent states, there is a territory north of the Sea of Marmora forming part of Turkey. Gibraltar, a bold promontory at the south of the Iberian peninsula is a dependency of Great Britain.

Albania. A mountainous republic on the west of the Balkan peninsula with a coast line on the Adriatic Sea. It has an area of 10,629 square miles and a population, 1974 estimate, of 2,400,000. The people support themselves mainly through agriculture devoted chiefly to livestock. There are vast tracts of undeveloped forests and considerable unexploited mineral wealth, consisting largely of copper, salt, coal, and oil.

Tirana is the capital and largest city. Durrës, the chief port is equipped with modern facilities.

Austria. An inland republic of central Europe, bounded on the north by Germany and Czechoslovakia and on the remaining sides by Hungary, Yugoslavia, Italy, and Switzerland. The western part, known as the Tyrol, is a mountainous region, widely celebrated for its bold, picturesque scenery. In the north, Austria is traversed by the Danube River, which provides a navigable waterway several hundred miles in length.

On an area of 32,366 square miles, Austria supports a population numbering, in 1971, 7,456,403. Agricultural products comprise chiefly wheat, rye, barley, oats, potatoes, and sugar beets. Dairying is a thriving industry. Austria is one of the world's chief sources of graphite. Petroleum also is produced. Manufactures include lumber, textiles, glass, sugar, paper, furniture, pianos, and chemicals. Most of the industry is nationalized. Tourism is a leading source of income. German is the language of Austria.

Most of the inhabitants are Roman Catholic. There is a system of compulsory elementary education. The largest of the three state universities is situated in the capital, Vienna, a city which has for centuries been a center of learning and of art.

Belgium. A small kingdom of Europe with a coast line on the North Sea. The country is bounded by France, Luxembourg, Germany, and the Netherlands. Its area is 11,750 square miles, its latest population figure 9,651,000.

Nearly all of the surface of Belgium is arable and is intensively cultivated. The country is also industrially one of the most highly developed in the world, being favored in this respect by the occurrence of coal and of iron deposits in close proximity to each other. The recovery of Belgium since its liberation

in 1944 is extraordinary. Increases in the output of grains, potatoes, beet sugar, milk, meat, coal, chemicals, machinery, glass, paper, beer, textiles, and zinc are outstanding. Diamond cutting is an important industry.

Two languages are spoken in Belgium—French in the south by the Walloons, a people of Celtic origin, and Flemish in the north by the Flemings, who are of the Teutonic race. The majority of the inhabitants professing a religion are Roman Catholics. Of the country's four universities, Louvain is the most celebrated. The capital and largest city is Brussels. Other cities of note are Antwerp, Ghent, Liège, and Ostend.

Bulgaria. A mountainous republic of southeastern Europe, with an eastern coast line on the Black Sea. Bulgaria lies between Rumania on the north and Greece on the south and stretches westward to the borders of Yugoslavia. Its area is 43,000 square miles.

The Balkan mountains divide southern Bulgaria from the northern zone, in which a cool climate and a fertile soil foster agriculture of a temperate zone type. The perfume attar of roses is a distinctively Bulgarian product. Apart from it the chief products are grains, tobacco, livestock, cotton, hemp, flax, silk, beans, sugar beets, fruits, rice, and various flowers. The manufacturing of textiles is the chief industry. The Danube River, which constitutes the northern border of Bulgaria, provides, with its affluents, important water highways for trade.

Agriculture of various kinds engages the activities of about one-fifth of Bulgaria's population, which the latest census listed as 8,706,000. The prevailing religion is Greek Catholicism. Elementary instruction is free and obligatory. Sofia is the capital and largest city of the country.

Czechoslovakia (*chĕk'ô-slô-vä'kĭ-ȧ*). An inland republic of central Europe, closely allied with the Soviet Union. The country is narrow and elongated, lying in a general east and west direction. It is bordered by Poland, Germany, Austria, Hungary, and Russia. The area, 49,359 square miles, is about the size of the state of New York. The population, in 1974, was estimated to be 14,738,377. Approximately three-fourths of the people are Czechs and Slovaks.

About one-third of its area is covered with valuable forests and by 1946 the pulp and paper industry had reached 80 per cent of prewar output. The soil is fertile and supports extensive and intensive agriculture; the chief crops are potatoes, sugar beets, wheat, barley, rye, oats, hops, tobacco, and various fruits and vegetables. The coal deposits are extensive and provide a surplus for export. Gold, silver, copper, lead, and rock salt are also found. The textile, porcelain, glass, furniture, sugar, chemical, and metal factories place Czechoslovakia among the more important manufacturing countries of Europe. By decrees of October 1945 all national resources, public utilities, and other important branches of industry and trade were nationalized. Transportation is provided by the Elbe and Danube rivers, and by more than 13,241 km. of railway and about 73,538 km. of highway.

Approximately seventy-five per cent of the inhabitants are Roman Catholics in spite of the fact that the provinces of Bohemia and Moravia constituted one of the earliest centers of Protestantism. The Moravian Church in America was founded by emigrants from this region. In 1975, universities had a total attendance of 144,325. The capital and largest city is Prague, with a population in 1975 of 1,161,000.

Denmark. A small kingdom of northern Europe, consisting of the greater part of the Jutland peninsula and of several adjacent islands, the largest of which are Zealand and Funen. The Faroe Islands, lying nearly midway between Scotland and Iceland, are administratively a part of Denmark. The total area of the country is 16,619 square miles. Greenland is an integral part of Denmark.

The surface of continental Denmark is a low rolling plain nowhere exceeding 570 feet in altitude. Sand dunes fringe much of the coast line, often extending five or six miles inland. Considerable areas of peat bog provide fuel for the inhabitants. Forests, mainly of beech trees, cover about 750 square miles. Apart from lumbering, the principal industries are agriculture, dairying, and fishing. The value of the annual catch of fish is considerable. The farm produce is marketed largely by co-operative societies. Copenhagen porcelain is a distinctive product of the country's manufacturing industry.

The population of Denmark is 5,054,410, most of whom are Lutheran Protestants in religion. Illiteracy is virtually nonexistent, elementary education having been obligatory since 1814. The University of Copenhagen stands at the head of the educational system, which is of the most enlightened type and is well adapted to the interests of the people. The capital, Copenhagen, is situated on the island of Zealand. With a population of 1,380,204, it contains nearly one-fifth of the inhabitants of the country.

A territory known as Northern Schleswig was added to Denmark in 1920 as a result of the Treaty of Versailles. This territory had been wrested from the Danes by Germany in 1864.

Finland. One of the most northern countries of Europe, lying between the Gulf of Finland and the Gulf of Bothnia and extending northward almost entirely across the neck of the Scandinavian peninsula. The Aland islands off the southern coast are governed as part of Finland. About one-fourth of the country's 130,127 square miles of surface is within the Arctic circle. In the north, mountains rise to a height of 4000 feet, but the remainder of the country is, for the most part, a plateau having an average elevation of about 500 feet. The numerous lakes of glacial formation, which occupy 11 per cent of the area of the country, have won for Finland the name of "the land of the thousand lakes."

Although agriculture employs more workers, forest products, chiefly timber, pulp, and paper, account for a large part of the country's export trade. Nearly two-thirds of the country is covered with pine forests.

The population of Finland in 1974 was 4,691,556. Lutheran Protestantism is the prevailing religion. The country has a well developed system of elementary, secondary, technical, and higher education. The capital and largest city is Helsingfors (Helsinki), a city of 502,383 inhabitants, situated in the southern extremity of the country. Other important towns are Turku (Abo) and Tampere (Tammerfors).

The inhabitants of Finland are mostly of the Finnic race, which is believed to have occupied formerly the whole of northern Asia and northeastern Europe.

France. A republic of western Europe, bounded on the north by the English channel and on the west by the Bay of Biscay. On the south, France is separated from Spain by the Pyrenees mountains and has a southern coast line on the Mediterranean Sea. On the east and northeast, France adjoins Italy, Switzerland, Germany, Luxembourg, and

Belgium. The island of Corsica in the Mediterranean Sea is politically a part of France. The coast line of the country is nearly 2000 miles in length, but, being either sandy or high and rocky, it affords few good harbors. The total area of the republic is 212,919 square miles.

Since World War II France has been successful in securing certain boundary changes. On the Italian border they acquired the pass and enclave of Tenda and Briga in 1947. France also secured minor border rectifications in the areas of Little St. Bernard Pass, Mt. Cenis Pass, and Mt. Thabor and Chaberton. Other eastern continental boundaries reflect the great zone of transition between western and central Europe. After both wars of this century the French were eager to have the Saar with its coal mines under their political, or at least economic, control. In the Rhineland the French have wanted to see an independent unit separate from Germany, and in the industrial Ruhr they have favored international control.

The most elevated part of France is in the southeast, where the Jura mountains and the Alps divide the country from Switzerland and Italy. Mont Blanc, an Alpine mountain within the French border, is the second highest peak in Europe, having an altitude of 15,781 feet. The lower, forest-clad Vosges ridge farther north separates Alsace from the rest of France. These mountain groups form the eastern side of the Rhone-Saone River valley, which is flanked on the west by the Cevennes mountains. The Rhone, rising in Switzerland and being augmented by the Saone river, flows southward into the Mediterranean Sea. The Saone River is connected by a canal with the upper reaches of the Seine river, which, with its tributaries,—the Marne and the Oise,—drains northward into the English channel. The other chief rivers of France flow westward and empty into the Bay of Biscay. They are the Loire, to the north, and, farther south, the Garonne and the Dordogne, which mingle their waters in the broad estuary called the Gironde River.

The principal rivers are all more or less navigable and afford shelter for such seaports as Havre and Rouen on the Seine, Saint Nazaire and Nantes on the Loire, and Bordeaux on the Garonne. The rivers as highways of inland commerce are supplemented by numerous canals.

France has considerable deposits of coal centering around Valenciennes near the northeastern border. The mines of this region were wrecked by the Germans during World War I, and from 1920 to 1935 the French operated the German coal mines in the Saar basin. France controls more iron than does any other European country, the mines being located in Lorraine, from which about one-tenth of the world's supply of iron ore is obtained. Other minerals produced in important quantities include gold, antimony, salt, potash, manganese, and bauxite, the ore of aluminum.

Of the surface of France, about one-fifth is forested, and approximately three-quarters is devoted to agriculture and grazing. Wheat, oats, potatoes, rye, barley, corn, and sugar beets are the leading crops. In the south, the climate is subtropical and fosters the cultivation of olives, peaches, apricots, oranges, mandarins, lemons, walnuts, and almonds. Apples, pears, cherries, plums, and berries are also produced in important quantities. The abundance of grapes grown in France enables her to rank as the leading wine producing country of the world. The cultivation of silkworms is an important industry in the south.

The fisheries of France are among the more important in the world. Large fleets are sent each year to catch cod about Newfoundland and about Saint Pierre and Miquelon, which lie off the south shore of Newfoundland. These two small islands constitute the sole remaining part of France's former empire in North America. Sardines are caught on France's northwestern coast and anchovies and tunny fish are obtained from the Mediterranean Sea.

The textile industries of France are famous the world over. The city of Lyon is the greatest silk center in Europe. Rayon also is manufactured there in large quantities. Rouen, on the Seine River, is noted for its cotton cloth made mainly from cotton grown in the United States. A large wool industry flourishes in the northeast. Paris is the seat of manufacture for the most costly products, including tapestries, shawls, jewelry, watches, and scientific instruments. Other manufactured products include chemicals, iron and steel, automobiles, electrical equipment, fine leather goods, the exquisite porcelains of Sèvres and of Limoges, cut glass, pottery, perfumes, and similar articles requiring skill and taste for their production.

After World War II, the French government stimulated agricultural and industrial production by means of agricultural price supports and tax incentives for industry. Chemical, fertilizer, tractor, shipbuilding, electricity, and automobile industries were greatly expanded. New industries included oil refining and atomic energy. Social welfare measures included old-age pensions, unemployment and medical benefits, and family allowances.

The population of France in 1968 was 49,795,000. The great majority of those professing a religion are Roman Catholics. Illiteracy is almost unknown. At the head of the educational system stand 23 universities, of which the University of Paris is the most notable. Apart from Paris, the capital, the great emporiums of trade include Lyon, Lille, Saint Etienne, Toulouse, Strasbourg, and Reims. The more attractive maritime ports are Marseille, Bordeaux, Le Havre, and Cette.

City	Population	City	Population
Paris	2,590,771	Le Havre	199,509
Marseille	889,029	Lille	190,546
Lyon	527,800	Rennes	180,943
Toulouse	370,796	Toulon	174,746
Nice	322,442	Montpellier	161,910
Bordeaux	266,662	Grenoble	161,616
Nantes	259 208	Brest	154,023
Strasbourg	249,396	Reims	152,967
St. Etienne	213,468	Clermont-Ferrand	148,896

French Community. Until the beginning of World War II France controlled a colonial empire second only to that of Great Britain. The combined area of French dependencies was more than twenty-one times that of European France. In geographical range, the colonies, mandates, or protectorates administered by France extended from neighboring North Africa to America, to Southeast Asia, to Oceania, and to huge sections south of the Sahara desert, some of them in West Africa along the Atlantic coast, and some in the interior, particularly in Equatorial Africa. Added to these was the large island of Madagascar in the Indian Ocean.

From the war France emerged weakened but determined to retain her empire. However, the tide of the future was against her until she learned from two costly wars how to ride it. The wave of the future was the spirit of racial equality which inspired the peoples of Africa and Asia to throw off colonial status and to seek by their own efforts to obtain the higher standards of living which modern science had made possible.

France initially surrendered control of Morocco and Tunisia, but held tenaciously to Algeria, where a century of colonization and settlement had resulted in a French population of over ten per cent of the total. Algeria was regarded as administratively a part of France. Independence was refused,

and for many years the resistance of the rebels tied down a large portion of the French army. When it became apparent to the French government that it could not win the war, negotiations began looking to Algerian independence. Immediately the French settlers and many of the leaders of the Army opposed the French policy, and civil war was averted only by turning control of the government over to Charles de Gaulle and granting him almost dictatorial power for a limited period.

Meanwhile a similar struggle had gone on in French Indo-China, where the forces seeking independence were assisted by the Chinese Communists. The French were defeated and withdrew before the crisis in Algeria had come to a head.

De Gaulle, having subdued the army insurrection, proposed to France and to all French dependencies a new political formula modeled after the British Commonwealth of Nations. As part of the new constitution adopted by popular vote in 1958 by France and most French territories overseas, each of the latter might choose either to retain its status, to become a department of France, or to be an independent member of the French Community.

Most of the territories elected membership in the Community. Guinea alone rejected the constitution and was cut off from France. Algeria was given complete independence in 1962. Much of the French population in Algeria returned to France to live.

The French Community is organized as follows:

Member States—France (including Corsica), Central African Empire, Congo, Gabon, Malagasy, Senegal, Chad.

Overseas Departments—Martinique, Guadeloupe, Reunion, French Guiana.

Overseas French Territories—French Polynesia, New Caledonia, Southern and Antarctic Territories, Wallis and Futuna Islands, Saint-Pierre and Miquelon.

Condominium—New Hebrides.

Independent Countries with Special Agreements—Algeria, Benin, Cameroon, Ivory Coast, Mali, Mauritania, Niger, Togo, Upper Volta.

Germany. A historic and heavily populated commercial and agricultural area in north central Europe. Following the surrender of Nazi Germany in 1945, the country was divided into four zones. The United States occupied the southwest, Great Britain the northwest, France the west, and Russia the east. When the four Allied Powers of World War II were unable to reach a postwar agreement as to the future administration of Germany, the country became permanently split. The three zones occupied by the United States, Britain, and France became the Federal Republic of Germany (West Germany) on May 23, 1949. The Soviet-occupied zone became the German Democratic Republic (East Germany) on October 4, 1949. Former German territories east of the Oder and Reisser rivers—Silesia, East Prussia, and most of Pomerania—were given to Poland by the U.S.S.R. at the close of World War II.

East Germany. The German Democratic Republic covers 41,648 square miles and had a 1975 estimated population of 16,820,249. The country is bordered by the Baltic Sea on the north, on the east by Poland, on the southeast by Czechoslovakia, and on the southwest and west by the Federal Republic of Germany. The northern part of the land is characterized by lakes and low hills. Most of the country's farming is done on the fertile plain of the central region. The heavily forested middle range mountains in the southern area are one of the most scenic parts of Germany. There are five major rivers in East Germany. They are the Elbe, Oder, Saale, Havel, and Spree.

East Germany is largely dependent on industry although there are few natural resources and a great deal of raw material must be imported. The chief industries are iron and steel products, chemicals, fertilizers, synthetic rubber, drugs, and plastics. The East Germans are large food producers and rank in the top ten nations of the world in the production of rye, barley, and oats. Other major crops include potatoes, sugar beets, and wheat. The major trading partners of East Germany are the U.S.S.R. and Czechoslovakia.

The capital city of the German Democratic Republic is East Berlin, with a 1973 population of 1,088,828. Other major cities with their 1973 populations are: Leipzig (574,432), Dresden (506,067), Karl-Marx-Stadt (302,409), and Magdeburg (274,146).

West Germany. The Federal Republic of Germany is bordered by the North Sea and Denmark on the north, East Germany and Czechoslovakia on the east, Austria and Switzerland on the south, and by France, Luxembourg, Belgium, and the Netherlands on the west.

The country covers an area of 95,959 square miles; its estimated 1975 population was 61,644,600. The land is generally flat in the north and hilly in the central and western regions. The Bavarian Alps and the Black Forest make the southern part of the country a major tourist attraction. The principal rivers of West Germany are the Rhine, Danube, Ems, Weser, and the Elbe.

West Germany is one of the most highly industrialized countries in the world. It is rich in natural resources—including coal, iron ore, lead, and zinc. The chief industries are the manufacture of iron and steel products, chemicals, electricity, machinery, and aluminum products. Advanced farming techniques have made West Germany a leader in food production and its farms produce a high yield of rye, wheat, oats, barley, and potatoes. West Germany also has major forestry and fishing industries. Its main trading partners are France, Belgium, the Netherlands, and the United States.

The historic capital and largest city of Germany is Berlin. Bonn is the seat of the West German government. The leading cities in West Germany, with their estimated 1975 populations are as follows:

City	Population	City	Population
Berlin (West)	1,984,837	Stuttgart	600,421
Hamburg	1,717,383	Duisburg	591,635
Munich	1,314,865	Bremen	572,969
Cologne	1,013,771	Hanover	552,955
Essen	677,568	Nuremberg	499,060
Dusseldorf	664,336	Bochum	414,842
Frankfort	636,157	Wuppertal	405,369
Dortmund	630,609	Gelsenkirchen	322,584

Gibraltar (*jĭ-brôl'tĕr*). A rocky promontory near the southern point of the Iberian peninsula and commanding the western entrance to the Mediterranean Sea. It is a possession of Great Britain. It covers about two square miles and consists mainly of a fortified rock, 1439 feet high, at the foot of which is the town of Gibraltar with a population in 1967 of 25,281. The fortress was obtained by Great Britain from Spain in 1713. From 1779 to 1783, it withstood a siege of 3 years, 7 months, and 12 days at the hands of a Spanish fleet.

Great Britain. An island kingdom lying north and slightly west of France and separated from it by the English channel, which narrows from a maximum width of 150 miles near the west end to a neck in the east, 21 miles wide, called the Strait of Dover. Geographically, the term Great Britain has reference to the one large island divided, for historical reasons, into England and Wales in the south and Scotland in the north. As a political division, however, Great Britain, officially known as the Kingdom of Great Britain and Northern Ireland, includes also Northern Ireland, the Orkney islands, the Shetland islands, and the Hebrides,—three groups lying north of Scotland,—the Scilly islands and the Isle of Wight in the south, and nearly 800 smaller islands. The Isle of Man in the Irish Sea and the Channel islands,—Guernsey, Jersey, and their dependency, Sark island,—are not subject to British legislation unless specifically designated in particular enactments. The area and the population of Great Britain and of its principal divisions are given in the table of *The British Commonwealth*.

The island of Great Britain is about 700 miles long from north to south, and its width varies from 280 miles in the extreme south to 30 miles in northern Scotland, where Dornoch Firth and Loch Broom penetrate deeply into the land from opposite sides of the island. The coast line is well in excess of 4000 miles, being deeply indented by the estuaries of tidal rivers and, especially in northern and western Scotland, by deep, rocky fiords. The chief of these inlets on the eastern side, named from south to north, are the estuary of the Thames, the Wash, the Humber River estuary, the Firth of Forth, the Firth of Tay, Moray firth, and Dornoch firth. On the western side, the principal inlets are Bristol channel, Cardigan bay, the Dee River and the Mersey River estuary, Morecambe bay, Solway firth, the Firth of Clyde, and the Firth of Lorne with its continuation known as Loch Linnhe.

The seas surrounding Great Britain are shallow, rarely exceeding 300 feet in depth. This circumstance has the effect of protecting the island from the cold arctic currents, so that the country enjoys a climate much milder than that in corresponding latitudes of America. The shallow waters provide a feeding ground for fish, thereby supporting fisheries of great value.

Great Britain has been the most active colonizing nation in Europe. As islanders, the British turned readily to seafaring and were among the first to explore the Americas, Australia, the Orient, Africa, and other regions. The settlers succeeded in carrying their institutions to many distant parts of the world and thus laid the foundation for the present British Commonwealth of Nations and the system of dependencies which are found in every continent. The English language and English basic institutions were transplanted to North America, Australia, and New Zealand. Through the rapid growth of these settlements, in population and power, and particularly of the United States, the influence of the English heritage is widely spread throughout the world.

The worldwide demand of underdeveloped countries throughout the world for political independence had a sharper impact on Great Britain than on any other country for the reason that her commitments among them were the greatest. Drawing on prior experience and modifying old formulas of association, she succeeded in transforming her empire into a commonwealth with a minimum of conflict and political unsettlement. Nearly all such territories after attaining independence requested Great Britain to sponsor their admittance to the British Commonwealth of Nations, and the body consisting of the heads of member states acted favorably on their application.

ENGLAND. A division of Great Britain comprising most of the southern part of the island and divided from Scotland on the north by a low ridge, called the Cheviot hills. The maximum length of England is 425 miles, and the width varies from 280 miles to 62 miles. The surface is, in general, a rolling plain, rising in the north to the low mountains in Derbyshire, Yorkshire, Westmoreland, and Cumberland. In the northwest is the "lake district," where occur the largest lake and the highest mountain in England—Lake Windermere, 10½ miles long, and Sca Fell, 3210 feet high. The chief rivers flowing into the North Sea on the east are the Thames, the Humber, the Tees, and the Tyne. Those flowing west include the Severn, Dee, and Mersey.

England is one of the leading exporting countries in the world. The richest coal fields are located in the region of Newcastle in northeastern England and in an area 100 to 150 miles farther south, where the proximity of large iron deposits has resulted in the growth of such huge manufacturing cities as Sheffield and Birmingham. In production of iron, England ranks among the world's leading producers. Her manufactures, however, require the importation of additional ore, which comes mainly from Spain and Sweden. The southwestern extremity of England has been the chief European source of tin since the days of the Phœnicians. Lead, silver, and zinc are mined in the northeast.

About 5 per cent of England is covered with forests, of which certain tracts, such as Epping forest near London, were formerly set aside as royal deer forests. Epping forest is now open to the public as a park. The greater part of the country's surface is fertile, and, being tilled according to the most advanced methods, it is highly productive. The live stock of England and of Great Britain generally is of a superior quality. No country has produced more standard breeds of domestic animals.

England was the first country in the world to become industrialized and still remains one of the greatest manufacturing nations. In the making of cutlery and other steel products and of cotton, woolen, and linen textiles, England is excelled by no other country. The shipbuilding industry of Great Britain, favored by the numerous harbors of the island, is likewise unsurpassed. British ships do a large part of the carrying trade of the world. The foreign trade of the country exceeds that of any other country of the world. The total length of canals is about 2,500 miles, and of railways, nearly 20,000 miles.

World War II and the political and economic developments which followed had the effect of weakening England's relative position in the world. But the people accepted years of austerity to safeguard the country's position in commerce and trade, many of the most attractive manufactured products being kept from the home market and reserved for export.

At the same time, welfare measures such as old-age pensions, unemployment compensation, and family allowances were enlarged by a system of health insurance. The educational system was modified to make advanced training more available to persons of all classes of society.

The population of England is about 95 per cent Protestant, the majority belonging to the Anglican, or Protestant Episcopal, Church, which is the

"established church" of the country. No civil disabilities, however, attach to any British subject on account of religion. The outstanding universities of England are Oxford, Cambridge, and the University of London. Illiteracy is almost unknown. By an act passed in 1918, part time attendance at free continuation schools is required of all people up to 16 years of age, and, when the necessary facilities are provided, the age limit is extended to 18 years.

London, the capital of Great Britain, is one of the largest cities in the world. The chief cities with estimated populations are as follows:

City	Population	City	Population
London	7,880,760	Wolverhampton	266,890
Birmingham	1,101,990	Enfield	266,640
Liverpool	705,310	Westminster	258,930
Manchester	616,520	Newham	257,350
Sheffield	534,100	Islington	254,580
Bristol	518,640	Haringey	254,120
Leeds	507,780	Newcastle upon Trent	251,650
Lambeth	338,130	Havering	251,160
Coventry	333,830	Hackney	249,140
Wandsworth	330,470	Plymouth	247,400
Croydon	328,290	Redbridge	245,300
Barnet	315,210	Camden	238,020
Nottingham	309,740	Waltham Forest	237,910
Bromley	302,660	Hillingdon	234,470
Ealing	302,570	Greenwich	231,150
Southwark	300,720	Sunderland	219,270
Bradford	296,860	Portsmouth	219,110
Kingston upon Hull	295,900	Bexley	215,330
Brent	293,370	Kensington & Chelsea	213,310
Lewisham	289,700	Hammersmith	211,720
Cardiff	289,320	Southampton	209,790
Leicester	282,800	Harrow	208,200
Stoke on Trent	275,703	Hounslow	206,870

WALES. The roughly rectangular land projection west of England, which lies between the Irish Sea on the north and Bristol channel on the south. Its surface is more mountainous than that of England, the highest peak being Mount Snowdon, 3560 feet in altitude. Wales contains some of the most valuable coal beds in Great Britain, and its largest city, Cardiff, exports more coal than any other city of the world. The inhabitants are of Celtic origin rather than Germanic, and about 40 per cent of them can still speak the native Welsh language. In religion, most of the Welsh are nonconformists, principally Methodists and Presbyterians.

SCOTLAND. The portion of Great Britain north of the Cheviot hills. It is, in general, a more mountainous country than England. The chief rivers flowing to the east are the Tweed, the Forth, and the Tay. The Clyde is the only important river draining westward. Scotland has many beautiful lakes, of which Loch Lomond, 24 miles long, is the largest. The country is divisible, by the nature of its surface, into the highlands of the north, the central lowlands, and the southern uplands.

The highlands of Scotland occupy nearly half the country. They are remarkable for their mountainous masses, which are especially rugged along the western coast. The region is cut into two parts by the Great Glen of Scotland, a depression in which lie the elongated lakes, Loch Ness and Loch Lochy. These have been connected and made part of the Caledonian canal, which provides a waterway from Moray firth in the east to the Firth of Lorne in the west. Southwest of the Great Glen are the Grampian hills, which culminate in Ben Nevis near the center of the western coast. This mountain, having an altitude of 4406 feet, is the highest peak in Great Britain.

The southern uplands constitute a region of low mountains, none exceeding 3000 feet in height. Between them and the highlands of the north lies a fertile plain, which supports a dense population and flourishing industries.

The minerals of Scotland include coal, iron, and oil shale. Of the last named, Scotland has about 80 per cent of the amount in the world known to be available. Agriculture in Scotland is often handicapped by an excessive rainfall. Of the chief crops,—oats, barley, turnips, and potatoes,—oats are grown in the most important quantities. The southern uplands are excellently adapted to grazing, and sheep are raised in large numbers. Cheviot sheep and the Ayrshire, Galloway, Polled Angus, and Jersey cattle were first bred in Scotland, while the Shetland breed of ponies originated in the Shetland islands lying to the northeast.

The industries of Scotland are similar to those of England, consisting chiefly of textiles steel products, and shipbuilding. At Glasgow on the Clyde are located the world's largest shipbuilding yards. Most of the Cunard liners have been built in these yards. The country is noted also for its production of whisky and of preserved fruits.

Scotland is the original home of Presbyterianism, the form of Protestantism professed by the established church of Scotland. The Roman Catholic Church is relatively stronger than in England. There are four universities in the country—Edinburgh, Glasgow, Aberdeen, and Saint Andrews. Scotland enjoys the same system of continuation schools as that described under *England*. The county authorities are empowered to provide educational books for the use of the adult population. The Gaelic language is still spoken in parts of Scotland.

Three-quarters of Scotland's 5,188,000 inhabitants live in towns or cities. The largest urban center is Glasgow, population 960,527. Edinburgh, population 467,986, is the seat of the supreme court, Scotland having courts and a system of law differing from those of England and based on French models

Greece. A maritime country occupying the southern part of the Balkan peninsula and including about 500 near-by islands, of which Crete is the largest. The shores of the mainland are bold, rocky, and deeply indented. The Gulf of Ægina, stretching inland from the east, is connected by a canal with the Gulf of Corinth, which is an inland continuation of the Gulf of Patras on the west coast. The resulting peninsula, called the Peloponnese in ancient times, is now known as Peloponnisos. The total area of the country is about 51,180 square miles.

About four-fifths of the surface of the mainland is crumpled by a complex system of mountains, which divide the surface into a number of small plains. The chief range, running north and south, is called the Pindus. The highest peak is Mount Olympus, in northern Greece, which has an altitude of 9570 feet. Mount Parnassus, celebrated in literature as the home of the Muses, is 8062 feet high. It is situated just north of the Gulf of Corinth and is sometimes known as Mt. Liakura. The progressive deforestation which has taken place in Greece is believed to have made the country drier than it formerly was. The climate is otherwise marked by intensity of heat in the summers and occasionally by severe cold in the winters.

The small plains of Greece provide the major part of the arable land. Agriculture, though practicable on only one-third of the country's surface, is the leading industry of the country. By the draining of Lake Copais in central Greece, about 53,000 acres were reclaimed in 1894. The chief crops are olives, wheat, grapes, corn, currants, figs, tobacco, oranges, lemons, barley, and oats. Currants constitute a distinctive product. The English word currant is a corruption of Corinth, the name of a Greek city from which the fruit is exported. Other industries are the raising of sheep and of goats. Lignite, magnesite, iron, salt, lead,

emery, and zinc are mined. Slag from the silver mines at Laurium is being worked over for lead that the ancient Athenians failed to extract.

The Greeks are a commercial people. Along with the manufacture of textiles, leather, and soap, shipbuilding ranks high among the industries. The Greek trader has for more than 2500 years been found everywhere throughout the Levant, as the countries washed by the eastern Mediterranean Sea are sometimes called. Seventy-five per cent of the Greek ocean-going ships were lost during World War II, the coastal fleet was ruined, and Greek ports were severely damaged. Railways and highways suffered similar losses.

Most of Greece's 8,803,000 (1968 est.) inhabitants profess the Greek Catholic faith. The spoken language, known as Romaic, is related to ancient Greek much as Italian is related to Latin; the literary language, however, is much closer to classical Greek. Athens is the capital and largest city of Greece, with a population of 1,852,709. Other notable cities are Salonika, Piræus, which is the port of Athens, and Patrai. Elementary education is nominally obligatory, but the percentage of illiteracy is high. There are government commercial schools and two universities at Athens, where also schools of archeology are maintained by American, British, French, Italian, and German learned societies. The Greek ministry of education is charged with the duty of conserving, repairing, and excavating ancient monuments.

The most notable architectural monuments of Greece date back more than 2000 years. Many of the finest buildings have been seriously mutilated, but some remain almost complete and still retain the dignity of their former state. Apart from Athens, the places containing the more interesting ruins are Olympia, Delphi, and Mycenæ.

Hungary. An inland agricultural republic in the eastern part of central Europe, bounded by Austria, Czechoslovakia, Russia, Rumania, and Yugoslavia. Hungary was defeated in both world wars and as a result, her territory has been reduced from over 60,000 square miles to 35,912, and her population has declined from more than 13,000,000 to 10,510,000.

The chief crops raised in Hungary are corn, wheat, sugar beets, barley, rye, oats, grapes, and tobacco. Most of the industries are those based on agriculture, such as flour milling and sugar refining. There are also iron and steel works. Hard and soft coal and bauxite are mined. Forests cover about 6 per cent of the surface. Important quantities of fish are obtained from Lake Balaton, the largest lake in central Europe, and from the rivers.

The majority of the people are Roman Catholics. There is a well developed educational system with compulsory attendance between the ages of 6 and 14. There are many fine universities and colleges. Budapest is the capital and largest city.

Iceland. An island state situated in the north Atlantic Ocean about 500 miles northwest of Scotland and 150 miles southeast of Greenland. The Arctic circle touches the most northern point of the island. The cold is not extreme, however, being moderated by the proximity of the ocean.

Almost the whole of Iceland's 39,758 square miles of surface is of volcanic origin, magnificent as scenery but unproductive. The ice-strewn plateaus, of which the island consists, average more than 2000 feet in altitude. The most celebrated of the island's 100 volcanoes is the Hekla, 4707 feet in height. The Great Geyser is 60 feet in diameter and, at intervals of several hours, projects immense quantities of hot water about 150 feet into the air. Boiling water from geysers is piped to the capital to heat buildings. About one-eighth of the island is covered by glaciers.

Nearly all the inhabitants of Iceland are dependent for their living on agriculture, stock raising, or fishing. Less than 1 per cent of the island is cultivated. The chief crops are hay, potatoes, and turnips. The exports consist almost entirely of live stock, mainly sheep and horses, and of fish and fish products. Trade is mainly with Great Britain, Russia, and the United States.

The population of Iceland in 1974 was 216,628. The national church is Lutheran. There is a complete system of education culminating in a university situated at Reykjavik, the capital of the republic.

Ireland. The large island lying immediately west of Great Britain and separated from it by the Irish Sea, which is connected with the Atlantic Ocean by Saint George's channel and by North channel. In the narrowest part of North channel, Ireland is separated from Great Britain by 14 miles. The area of the island is about 32,000 square miles. It has a maximum length of 300 miles and a maximum width of 180 miles. Politically, the island is divided into two parts. Eire occupies the whole island except a comparatively small district in the north. This district, under the name of Northern Ireland, constitutes a division of the Kingdom of Great Britain and Northern Ireland. For the area and the population of Northern Ireland, see the table of *The British Commonwealth*. Since 1850 nearly 4,500,000 Irish have emigrated to other countries, by far the greatest number having settled in the United States. The Irish are Celtic in origin. The Irish language was spoken by about 13 per cent of the population in 1920, and since then its use has been actively fostered by the government. Along with English, it is the official language of that state.

About two-fifths of Ireland's surface consists of bog. Most of the remainder is fertile. The humidity of the climate and the equability of the temperature foster a verdant clothing of vegetation, which has earned for Ireland the name of the "emerald isle." The island is drained by the Shannon river, which, having a course of 250 miles, is the longest river in the British Isles. The enchanting and romantic scenery of the lakes of Killarney in the south attracts visitors from all parts of the world.

Eire. This portion of Ireland is predominantly agricultural in its interests, being Great Britain's most important single source of foodstuffs. Marketing is accomplished largely through co-operative societies. The chief crops are potatoes, oats, turnips, barley, and wheat. Dairying and stock raising form an important part of the farm operations. There are also valuable sea and fresh-water fisheries, the catches including salmon, mackerel, cod, and herring. The chief manufactures are food products, beer, ale, and tractors.

The population of Eire, estimated in 1971 at 2,978,000, is predominantly Roman Catholic. At the head of the educational system stand two universities, both situated in Dublin, the capital and largest city of the country. Other cities of note include Cork and Limerick.

Northern Ireland. In addition to agriculture and fishing, the northern division of Ireland has a large manufacturing industry. This industry, which has been developed in spite of the lack of coal and of iron in the island, consists chiefly of shipbuilding, distilling, and the manufacture of linen and of other textiles.

The prevailing religion of Northern Ireland is Protestantism. The educational system is distinct from that of the other divisions of the United Kingdom. Belfast, the largest city, is the seat of a university and of the legislature and the judiciary of Northern Ireland. Londonderry is another important center of manufacture and of trade.

Italy. A republic occupying the large bootshaped peninsula of southern Europe. Italy includes also the islands of Sicily, Sardinia, Elba, and about 70 smaller islands in the surrounding seas. The land boundary at the north follows, in a roughly semicircular course, a mountain wall, which separates Italy from France, Switzerland, Austria, and Yugoslavia. To the east of the mainland lies the Adriatic Sea, at the head of which is the Gulf of Venice. The sea narrows toward the south to the Strait of Otranto, 45 miles wide at its narrowest point. Italy's western coast is washed by the Tyrrhenian Sea and by the Ligurian Sea, the latter having a broad northern inlet called the Gulf of Genoa. On the south, Italy is bounded by the Ionian Sea with its inlet, the Gulf of Taranto. The "toe" of Italy is separated from Sicily by the Strait of Messina, which has a minimum width of two miles. The mainland of Italy has an average width of about 100 miles and a maximum length of 780 miles. The total area of the country is 116,304 square miles.

Italy is mountainous and includes the only part of the European mainland which contains active volcanoes. Spurs of the Alps mountains, extending into Italy from the northern mountain wall, form the beautiful scenery of the celebrated Italian Tyrol. The range of the Apennines passes from the Gulf of Genoa to the southern extremity of the mainland. Vesuvius, a mountain of the latter range, Etna on Sicily, and Stromboli on one of the Lipari islands, north of Sicily, are volcanoes which are seldom quiescent. An earthquake at Calabria, southern Italy, in 1783, destroyed 100,000 lives, and another, about the Strait of Messina in 1908, resulted in the death of some 96,000 people.

The most important river of Italy is the Po, which drains the fertile, well watered plain of Lombardy in the north and discharges near the head of the Adriatic Sea. The Tiber, which empties into the sea near the center of the western coast, is richer in historical associations.

The mineral resources of Italy are comparatively small and insufficient for domestic use except for mercury and sulphur, which are exported. Petroleum, however, is found in quantity in Sicily, where there is one of Europe's largest oil fields. The output, however, is not sufficient to meet Italian demand, and imports are extensive, usually processed in Italian refineries. Other mineral products include marble, copper, zinc, iron, and manganese. The fisheries employ more than 150,000 workers.

The leading industry of Italy is agriculture. The climate, ranging from subarctic in the Alps to subtropical in the south, permits the cultivation of such varied crops as wheat, corn, potatoes, sugar beets, oats, grapes, olives, rice, beans, barley, and rye. Northern Italy is the most productive region, being cultivated by the most improved methods. Over 400,000 acres were reclaimed for agriculture in central Italy in the decade 1920–30. Silk culture is also a considerable industry. Wine, olive oil, and cheese are important exports of Italy.

Italian agriculture consists typically of small farms intensively cultivated but with a minimum of farm machinery, the farmers living in villages or even cities and traveling each day to their outlying farms. Under land reform laws of 1950, the government acquired and made available to farmers about one and a half million acres in lots of less than 12 acres each. A large number of Italian farm laborers have migrated in recent years to France and other members of the Common Market.

The chief manufacturing centers are in the north, where abundant hydroelectric power is available. The principal products include cotton and silk textiles, lace, straw hats, metal products, chemicals, sugar, rayon, leather goods, glass, pottery, perfumes, and paper. Shipbuilding is also an important industry. Among the distinctive products of Italian craftsmanship are cameos and marble statuettes. From Murano, near Venice, comes glass whose unrivalled beauty gives it a secure market throughout the world. The secret processes of manufacture go back at least to the 1200's. To protect them the Venetian rulers made it a capital offense for an artisan to emigrate.

The population of Italy in 1971 was 53,744,737 (est.). The prevailing religion is Roman Catholicism. Elementary instruction is compulsory. Italy has over 40 universities, many of them among the oldest in Europe. In addition, there are many technical colleges, art schools and learned societies. Everywhere throughout Italy are to be found monuments, more or less ruined, which bear witness to the fact that Italy was the chief center of European civilization from the 2d century B. C. to the 16th century A.D. The Italian government has capitalized on this fact by protecting the historical sites and prescribing for guides licenses granted only after rigorous training, thereby attracting tourists who normally exceed 18 million each year. Apart from the government's care for the more obvious historical attractions such as Pompeii, the ancient Roman structures in Rome, and still earlier Greek structures in Sicily, it assists in the archeological study and preservation of hundreds of underground Tuscan tombs which only in recent years have been known to exist.

Rome is the capital and largest city of Italy. The chief cities with their populations are given in the following table:

City	Population	City	Population
Rome	2,856,309	Cagliari	235,892
Milan	1,732,451	Brescia	215,317
Naples	1,224,274	Leghorn	177,526
Turin	1,202,846	Modena	176,796
Genoa	807,138	Parma	176,617
Palermo	661,235	Reggio di Calabria	174,462
Bologna	492,700	Salerno	159,302
Florence	464,897	Ferrara	155,478
Catania	399,635	Foggia	150,725
Bari	374,521	Prato	150,580
Venice	365,431	Ravenna	137,020
Trieste	271,536	Perugia	134,288
Verona	270,815	Reggio nell 'Emilia	129,787
Messina	259,858	La Spezia	122,754
Padua	239,250		
Tarento	238,749		

By the peace treaty signed at Paris February 10, 1947, Italy ceded four of her frontier districts to France, and most of the province of Venezia Giulia to Yugoslavia. She also gave up her former colonies, all in Africa, where her possessions were second in extent only to those of Great Britain and France. The United Nations supervised the reorganization of this colonial empire. Ethiopia, which Italy had conquered in 1936, was restored to independence, and the former Italian colony of Eritrea was joined to it. The former Italian colony of Libya was erected into an independent kingdom in 1951. Italian Somaliland was joined with British Somaliland to form the Somali Republic.

Monaco (*mŏn'ā-kō*). One of the smallest states in Europe. Monaco is a constitutional monarchy, lying in southeastern France and bordering on the Mediterranean Sea. The surface, about 2 miles long and half a mile wide, is mountainous and highly picturesque. The chief occupation of the 23,000 (1968 est.) inhabitants is to provide accommodation and entertainment for the visitors who, in numbers exceeding 1,500,000 each year, are attracted by this famous winter resort and gambling center. Despite popular misconception, the famous Monte Carlo

gambling casino now furnishes less than 10 per cent of revenues. While tourist trade remains of chief importance, local industries include making electrical appliances, radios, pharmaceuticals, and cosmetics.

Netherlands, The. A kingdom of northwestern Europe, roughly triangular in shape, with a northwestern coast line on the North Sea. The country, sometimes called Holland after the name of two of its provinces, borders on Belgium to the south and Germany on the east. No point in it is more than 120 miles from the sea, which forms more than one-half the total of its boundary. Its seacoast is 465 miles in length.

The surface of the Netherlands, 12,529 square miles in area, is, in large part, too low for natural drainage, portions of it being from 16 to 20 feet below the level of the sea. The population of 13,733,578 averages about 1,059 persons to the square mile, which makes the Netherlands the most densely populated country on the earth.

The former Zuider Zee, a large shallow gulf, formed by an inundation from the sea in the 13th century, was cut off from the sea by dikes in 1932, in order to be drained to one-third its former size, leaving a lake, Ijsselmeer. This reclamation project is the largest ever undertaken anywhere in the world. It adds 523,000 acres of arable land to the Netherlands, an increase of nearly one-tenth.

Part of the coast is bordered by sand dunes, which keep out the sea from the lowlands. In other parts, artificial embankments, or dikes, are erected for that purpose. In the interior of the country, also, such dikes are used to enclose swampy land, from which the water is pumped by windmills, leaving the soil of these so-called "polders" available for cultivation.

The Netherlands has a network of river mouths through which the Rhine, the Meuse, and the Scheldt rivers discharge their waters. These rivers are supplemented as trade highways by some 2000 miles of canals, which, both in mileage and in utility, vie in importance with the railroads. More than 50,000 people live on barges which ply along the waterways.

The distinctive products of the Netherlands are cheese, butter, margarine, and flower bulbs. More than one-half of the land is arable. It produces among other crops, rye, oats, potatoes, sugar beets, flax, and barley. Dairying is one of the leading occupations of the country. The Holstein breed of cattle, developed first in Holland, is one of the best milk producing varieties in the world. Herring and oysters are the chief products of the deep-sea fisheries, which formerly constituted the foundation of the country's wealth. The industries include shipbuilding, tobacco products, and pottery, and the refining of sugar, cocoa, and chocolate.

Until after World War II, the Netherlands had colonial possessions more than 50 times the area of the country itself, but practically all of them became independent. The Dutch merchant marine is among the world's largest.

The majority of the inhabitants are Protestants, but there is a strong Catholic minority. Both churches, as well as the Jewish religious bodies, receive grants from the government. Illiteracy is virtually unknown. The educational system provides widely different kinds of training. There are four state universities. Amsterdam was formerly the capital and is still the scene of the royal coronation. The seat of government, however, is The Hague. The following table gives the chief cities with their population in 1976:

City	Population	City	Population
Amsterdam . .	987,205	Utrecht . . .	464,357
Rotterdam . .	1,031,403	Eindhoven . .	358,234
The Hague . .	682,452	Haarlem . . .	232,048

Norway. A kingdom of northern Europe, occupying that portion of the Scandinavian peninsula which lies west and north of the ridge of the Kiolen Mountains. The country extends 300 miles within the Arctic circle to a latitude farther north than that of any other part of the European mainland. Norway possesses as a dependency the Spitsbergen Islands, a coal producing archipelago which is situated some 600 miles north of the country's northern extremity and stretches to a point about 650 miles from the north pole. The area of the archipelago is estimated at 25,000 square miles.

The surface of Norway, 125,065 square miles in area, is mountainous and, for the most part, barren. About one-fifth is covered with forests, mainly of pine and fir. The arable portion comprises a scant 4 per cent of the total area. The coast line is cut by deep, picturesque fiords, and is fringed by some 150,000 islands, the larger ones being in the north.

The climate is moderated by the warm ocean currents which flow past the coast. The Arctic coast settlement, Hammerfest, which is the most northern town in the world, has a mean winter temperature higher than that of New York. Numerous summer tourists visit the country, attracted by Norway's scenic beauty and by the spectacle of the "midnight sun." In the north, the sun never sets between the middle of May and the last of July.

The chief occupations of Norway's inhabitants are lumbering and fishing. Herring, cod, mackerel, salmon, whale, walrus, seal, and lobsters form the most valuable part of the catch. Ships from Norway carry on most of the whaling in the Antarctic. The merchant marine of Norway ranks, in tonnage, among the great commercial fleets of the world. The manufacturing industries of the country are largely dependent on water power, which is available in great abundance. The most important industrial products are pulp, paper, and chemicals.

The population of Norway, (4,017,101, 1976 est.) is almost entirely Protestant in religion. The Lutheran Church is endowed by the state. Education is obligatory and illiteracy is almost unknown. The one university is situated in Oslo (463,022), the capital and largest city. Other cities include Bergen (213,594), Trondheim, and Stavanger.

Poland. A nation of eastern Europe, the Polish People's republic was established after World War II. Poland covers an area of 120,665 square miles between Russia on the east and East Germany on the west. Poland borders on Czechoslovakia on the south and the Baltic Sea on the north. Apart from the Carpathian foothills in the south, with a maximum elevation of 2000 feet, the surface is a gently rolling plain, most of it drained northward by the Vistula River and its tributaries.

Since World War II Poland has become highly industrialized, using its abundance of coal, lignite, sulphur, copper ore, and zinc to produce manufactured goods. The major Polish industries are mining, machine manufacture, chemicals, power production, and food production. Poland is also the world's ninth largest producer of ships.

The people of Poland have exerted great effort to restore agricultural production since the war. Collective farming is being phased out by the government and a majority of the land is being turned over to private owners. The major crops of Poland are wheat, rye, potatoes, oats, barley, and sugar beets. The country's main trade partners are the U.S.S.R., Czechoslovakia, East and West Germany, and Britain.

Poland's 1976 estimated population was 34,300,000, 95 per cent of whom are Roman Catholic.

Education is free and compulsory between the ages of 7 and 15, and there are 89 institutions of higher education. Warsaw is the capital and largest city, with a 1973 estimated population of 1,388,000. Other major cities include Lodz (781,000), Krakow (657,000), Wroclaw (560,000), and Poznan (499,000).

Portugal. A republic occupying the most western part of the Iberian peninsula and washed on the south and on the west by the Atlantic Ocean. On the land side, to the north and the east, Portugal adjoins Spain. The area of Portugal is given as 34,500 square miles, little more than half of which is productive.

The country is traversed from east to west near its center by the Tagus River, the estuary of which forms one of the best harbors in the world. North of the river, the surface is a mountainous plateau, which is crossed by the deep, gorgelike bed of the Douro River. On the left of the Tagus River, a plain stretches southward to an irregular group of mountains in the southwestern extremity of the country. Between this group and a mountain ridge on the eastern border, the Guadiana River, rising in Spain, flows south to the Atlantic Ocean.

About 26 per cent of Portugal's surface is forested, mainly with pines, chestnuts, oaks, and cork trees. Cork is one of the chief sources of the national wealth. The acorns of the oak forests serve to fatten large herds of swine. The central part of the country produces enormous amounts of grapes, from which is made port wine, so called from Oporto, its point of export. In the south, olives, figs, oranges, lemons, and other tropical fruits are grown. Products of the fisheries—sardines and tuna fish—form, next to wines, the principal article of export. The mineral wealth is considerable. Wolfram, iron, copper, manganese, antimony, lead, tin, and gold are found. A characteristic industry is the manufacture of porcelain tiles. The chief manufactures are textile products.

The population of Portugal is 9,505,000. There is freedom of worship, but Roman Catholicism prevails almost to the exclusion of any other religion. Elementary education is compulsory and, since Portugal became a republic in 1910, has been rigorously enforced. There are three universities and several schools of technology and of art. The two principal cities are Lisbon—the capital—and Oporto.

Rumania. A republic of southeastern Europe with an eastern coast line on the Black Sea. Russia is its immediate neighbor to the north; Hungary and Yugoslavia, to the west; and Bulgaria, to the south. The area of the country is 91,671 square miles.

Rumania is divided into an eastern and a western part by the Carpathian mountains, which, in Rumania, trend south and southwest. This ridge is often known as the Transylvanian Alps, and the western part of the country is known as Transylvania. The remainder of the country is a plain drained by the Danube. This river has 595 miles of its course in Rumania and along the southern border.

After being joined by the Pruth, its great tributary from the north, the Danube empties through several mouths into the Black Sea. Navigation on the Danube according to the peace treaty of 1947 is free and open to all countries on an equal footing.

About four-fifths of the inhabitants of Rumania support themselves by stock raising and by agriculture of the usual temperate zone type, corn and wheat being the leading crops. Rumania is, next to Russia, the most important oil producing country of Europe. Other minerals obtained are lignite, coal, iron, copper, and salt, the mining of the last being a government monopoly. Flour milling, brewing, and distilling are the chief industrial interests. Apart from oil, the leading exports are grain, salt, coal, timber, and hides. In 1947 Rumania's transport services, oil, industry, and entire export-import trade were taken over by Soviet-controlled agencies.

The predominant religion of Rumania's 19,721,000 people is Greek Catholic. There are six universities in the country. Bucuresti (Bucharest) (1,372,937) is the capital and largest city of Rumania. Other cities of importance include Iasi (Jassy), Galati (Galatz), and Cluj.

Russia. The largest country in the world, occupying nearly half the total area of Europe and the whole northern portion of Asia. Including its Asiatic territory, Russia covers an area of 8,599,776 square miles, of which about 2,500,000 are in Europe. Officially known as the Union of Soviet Socialist Republics (U.S.S.R.), it is divided into the Russian Socialist Federated Soviet Republic (R.S.F.S.R.), which occupies about 78 per cent of the entire country, and fifteen other republics, of which seven are in Europe and eight in Asia.

The areas and population of the constituent republics, as estimated in 1969, were as follows:

Republic	Area in sq. miles	Population
RSFSR*	6,593,391	128,526,000
Ukrainian	232,046	46,752,000
Byelorussia (White Russia)	80,154	8,897,000
Moldavia	13,012	3,531,000
Estonia	17,413	1,316,000
Latvia	24,695	2,323,000
Lithuania	26,173	3,103,000
Azerbaijan	33,436	5,042,000
Georgia	26,911	4,710,000
Armenia	11,306	2,363,000
Turkomen	188,417	2,085,000
Uzbek	158,069	11,669,000
Tadzhik	54,019	2,823,000
Kazakh	1,064,092	12,877,000
Kirghiz	76,642	2,926,000
Total	8,599,776	238,943,000

*The first republic listed, the RSFSR, includes territory in Europe and Asia. The next 6 listed are in Europe. The last 8 are in Asia.

The surface of European Russia is a vast rolling plain, which rises, in the Ural mountains on the east, to an altitude of about 8000 feet and, at Mount Elbruz in the Caucasus range, to a maximum height of 18,465 feet. Almost the whole surface, however, is less than 600 feet above the sea.

Extreme cold in winter and extreme heat in summer constitute a general characteristic of Russia's climate. The Valdai hills in the west central part of the country form the chief watershed and give rise to the Don, the Dnieper, and the Volga, all flowing southward. The Dvina, the Neva, and the Volkhof are the most important rivers of northern drainage. The Volga river is navigable for 1800 miles. Canals join the principal rivers, making a system of navigable waterways having a total length of about 90,000 miles. The northern region abounds in lakes of glacial formation. Lake Ladoga near the border of Finland, with an area of 7000 square miles, is the largest lake in Europe.

Prior to the revolution of 1917, Russia was predominantly an agricultural country. In the next 40 years, it became also one of the world's leading industrial nations with over 80 per cent of the output nonagricultural, although the farm and nonfarm population were about evenly divided. But this industrial emphasis led to trouble, and Russia was compelled to import grain on a large scale in 1964. Farm land is partly owned and operated by the state, but most is operated by co-operatives with state-appointed managers. Individual workers are allowed small tracts to raise their own produce.

The official explanation for disappointing returns was that manufacture of fertilizers had been neglected; others attributed them also to inadequate investment and lack of incentive to produce.

Russia is one of the world's largest producers of wheat, barley, rye, flax, and oats. Other important crops are hemp, sugar beets, rice, cotton, tea, and tobacco. The richest soil lies in the so-called black earth belt, which extends from the Carpathian Mountains through the Ukraine in southern Russia to the borders of China. This is by far the greatest single wheat growing land on the face of the globe. In production of farm animals, Russia vies with the United States for the first place.

Industrialization in Russia was carried out by means of governmental planning and control, which extends to every aspect of its economic life. Frequently entirely new cities were created in the process, such as Magnitogorsk for the manufacture of steel. Dneprostroy, where Europe's largest hydroelectric station was erected, became a center for aluminum, ferroalloy, coke, and cement plants. Production of tractors was centralized in Volgograd (formerly Stalingrad) and Chelyabinsk. Russia is one of the world's largest producers of petroleum. Among the older centers of industry are Leningrad, which produces chemicals, matches, and rubber products, and Moscow, where the textiles and publishing industries are centered. Kharkov is a leading center of heavy industry. Centers of the atomic energy industry are scattered and unpublicized.

From the forests of the north come lumber, pulp, tar, turpentine, resin, and fur. Russia is the world's largest exporter of lumber. There are important fisheries in the Arctic Ocean and in the seas. The fisheries of the Volga River and of the Caspian Sea supply most of the sturgeon, whose eggs are salted and made into Russian caviar. From the Ural Mountains come asbestos and platinum. Here, too, is produced gold, making Russia a rival of South Africa as the world's chief source of the yellow metal. One of the chief sources of manganese is southern Russia, where there are also very rich deposits of coal and of iron. Copper is mined in the north.

The population of Russia, 1969 est., was 239,000,000. All forms of religion are permitted in Russia, but atheism is officially encouraged. Following the revolution in 1917, an ambitious and comprehensive system of education was inaugurated. Education is compulsory and even advanced education is free. Medical care and many other social services are provided by the government. The role of women in all phases of Russian life is greater than in any other large country.

The capital and largest city in Russia is Moscow. Other large cities of European Russia are Leningrad, Kiev, Odessa, Kharkov, Dnepropetrovsk, Saratov, and Gorkiy.

See also *Russia in Asia.*

Spain. A country in southwestern Europe, occupying about four-fifths of the Iberian peninsula. It is separated from France on the northeast by the Pyrenees Mountains and, in the southwestern part of the peninsula, surrounds Portugal on the land side. Spain is otherwise bounded by the Atlantic Ocean and the Mediterranean Sea, which are connected, at the southern extremity of the country, by the Strait of Gibraltar. Spain has an area of 194,945 square miles. It extends north and south 540 miles and, east and west, about 620 miles.

Next to Switzerland, Spain has the most elevated surface in continental Europe. Most of the interior is a table-land varying from 2000 to 3000 feet above the sea level. It is divided irregularly by low mountain ranges, of which the Cantabrian Mountains parallel the northern seacoast, the Sierra Nevada range skirts the Mediterranean coast, and the Sierra Morena trend east and west in the interior. Of Spain's rivers, the Douro, the Tagus, and the Guadiana have their mouths in Portugal. The Guadalquivir flows east and south into the Atlantic Ocean, while the Jucar and the Ebro empty into the Mediterranean Sea. The Guadalquivir and the Ebro are the only navigable rivers.

In the interior, the rainfall is light, and the climate is harsh, with cold winters and hot summers. The northern coast has the heaviest rainfall in Europe, and the southern coast has the warmest winter climate of any part of the continent. About one-sixth of the acreage is under forest, the more characteristic trees being the Spanish chestnut and the cork oak.

The leading occupations of the people are agriculture, grazing, fruit culture, mining, fishing, and manufacturing. Cereal crops are raised especially in the north and include, in order of importance, wheat, barley, rye, corn, and oats. Huge flocks of sheep and of goats graze on the dry, treeless plateau, where esparto grass is a characteristic type of vegetation. From this plant, rope and paper are made. In the southern part, which is known as Andalusia, grapes, oranges, olives, figs, peaches, dates, almonds, and other fruits and nuts are grown in abundance.

Spain is one of the chief wine producing countries of Europe. Mulberries are cultivated as a food for silkworms. Valencia in the south is the chief center of the Spanish silk industry. Raisins form a considerable item of export. Saffron and licorice are distinctive products of the region.

The mineral resources of Spain are among the richest in Europe. Iron ore is extensively exported. Spain is the chief European source of lead. Coal, copper, mercury, salt, zinc, tin, and potash are produced in important quantities. With the exception of steel and textiles, there are no important manufacturing industries. The country is deficient in petroleum. One of the chief products is cork, made from the bark of the cork oaks. The fisheries employ over 100,000, the chief catches being sardines, tunny fish, and cod. Oranges, olive oil, wines and cognacs, preserved fruits and fish, and almonds are among the chief exports.

The population of Spain is 33,823,918, practically all of whom are adherents of the Roman Catholic Church. The Basques, living near the head of the Bay of Biscay and numbering about 400,000, are believed to be descendants of a pre-Aryan people known to the Romans under the name of Iberians. Spain has also some 50,000 gypsies. Elementary education is compulsory. There are 13 universities. The capital and largest city is Madrid. Other important urban centers are Barcelona, Valencia, Seville, Malaga, Saragossa, Murcia, Bilbao, and Granada.

Spain was formerly one of the chief centers of Roman civilization. Bullfighting, the most popular national sport, is a survival of the ancient Roman wild beast shows.

Sweden. A republic of northern Europe, occupying the eastern and larger part of the Scandinavian peninsula. The country is 950 miles long and tapers to a blunt point at the north and at the south. It is bounded on the west by Norway and the Kattegat, and, on the east, by the Baltic Sea, the Gulf of Bothnia, and Finland. Its average width is about 190 miles, and its surface covers 173,436 square miles. The country includes many adjacent islands, the largest being Gottland and Oland.

Sweden is mountainous in the west, but the remainder of the country is flat. Most of the rivers are fed by lakes at the base of the Kiolen Mountains, which form the greater part of the Norwegian boundary. Toward the south, four large lakes occur, — Väner, Vätter, Mälar, and Hjälmar, — of which Lake Väner is the third largest in Europe. The first two are part of the Göta Canal system, which, giving access between the Baltic Sea and the Kattegat forms one of the chief arteries of Swedish commerce. The climate of Sweden is cold in winter and hot in summer; other seasons are short.

The most southern part of the country, known as Götaland, is the richest agricultural and industrial

region and is the center of the shipping interests. North of Götaland lies Svealand, the center of the political and intellectual life of the country. Norrbotten, stretching to the northern extremity of Sweden, furnishes minerals and timber.

About one-half of the population of Sweden is supported by agriculture. Hay, oats, and rye are the leading crops. Timber is one of the chief sources of Sweden's wealth, and the lumber and pulp wood manufactures hold the leading place among the industries. The iron of Sweden is of a particularly high grade. Rich gold mines in northern Sweden, began production about 1930. Manganese, lead, silver, copper, and zinc are also mined. The industries suffer from lack of coal, being compelled to utilize charcoal or hydroelectric power. The largest hydroelectric plant in Western Europe on the Ume river has helped to increase the output of numerous manufactured goods.

The population of Sweden (1970 cen.) was 8,076,903. Lutheran Protestantism is the established form of religion. There is an excellent system of education, at the head of which are six state universities. Illiteracy is almost unknown. The capital and largest city is Stockholm. Other cities of note are Göteborg and Malmö.

Switzerland. A mountainous inland republic of south central Europe, bounded on the north and east by Germany and Austria, on the west by France, and on the south by Italy. The surface of Switzerland, 15,941 square miles in area, has a greater average elevation than any other European country and contains the headwaters of four great European river systems,—the Rhine, the Rhone, the Po, and the Danube.

The northwestern half of the country is a rolling plateau hedged, near the northwestern border, by the Jura mountains. It drains northward toward the Rhine river and contains the lakes of Neuchatel, Bienne, Zurich, Lucerne, Thun, and Constance. The southeastern half is a region of picturesque mountains that has long been famous for its scenic beauty. The Southern Alps form much of the southern border of the country. Here are found the highest mountains, including Monte Rosa, 12,203 feet in height; Matterhorn, a towering pyramid of solid rock 14,701 feet high; Simplon, with an elevation of 11,117; Saint Bernard, 8110 feet high, near which the Saint Bernard breed of dogs was developed, the animals being used to help in the rescue of travelers lost in the snow. This range descends on the north to the valley in which the Rhone river rises and, flowing westward, broadens into Switzerland's largest body of water, the Lake of Geneva. At the southeastern border lies Lake Maggiore, which has a southern drainage into the Po river.

South of the Rhone valley rise the irregular Burnese Alps, the highest peak of which is the Jungfrau, "The Maiden," so called from the blush which suffuses its snowy peak at sundown. Its height is 13,653 feet.

The mountains of Switzerland are cut by some 40 passes, and over 1000 glaciers furrow the rocky slopes. The mountains are burrowed by several railroad tunnels, that at Mount Simplon, 12½ miles in length, being one of the longest in the world. A warm wind, known as the foehn, often, by rapidly melting the snow and ice, causes avalanches.

Partly as a protection against avalanches, the forests of the country, covering about one-sixth of the republic's area, are carefully guarded by the government. Maples, oaks, and chestnuts flourish at the lower levels. Higher up occur birches, and still higher, firs, pines, and larches. In this region, the characteristic alpine animals, the chamois and the ibex, may be seen. The edelweiss and certain other flowering plants grow almost as far up the mountain side as the summer snow line.

Switzerland is one of the most highly industrialized countries in Europe. Agriculture and dairying rank next as occupations of the inhabitants. Grapes, rye, barley, potatoes, oats, flax, hemp, and tobacco are grown in the valleys and on the plains, while the mountain sides provide abundant pasturage for cattle, goats, horses, and sheep. Swiss cheese, Swiss clocks, watches, and Swiss chocolate form some of the more distinctive products of the country. Machinery, textiles, clothing, chemicals, metals, and watches are the industries that employ the greatest number of people. The entertainment of tourists is one of the major industries.

The inhabitants of Switzerland, 6,269,783 in 1970, are a unit neither in race, language, nor religion. German, French, and Italian are spoken. Illiteracy, however, is virtually nonexistent. The Protestants are slightly more numerous than the Catholics. Higher education is cared for by seven universities, that at Zurich dating from 1460. A distinctive type of dwelling is used in Switzerland, known as the chalet. It has a projecting roof under which are placed balconies and staircases.

Berne is the capital and Zurich is the largest city. Geneva is headquarters of many international organizations.

Turkey. The European territory of Turkey consists of the territory north of the Sea of Marmora extending to the borders of Bulgaria and of Greece. It includes Adrianople and Istanbul, formerly Constantinople. Istanbul is treated among the cities of Europe, but the geography of Turkey is dealt with under *Asia*.

Yugoslavia (*yōō'gō-slāv'i-ā*). A republic of southern Europe with a southwestern coast line on the Adriatic Sea. On the land side, the country adjoins Italy, Austria, Hungary, Rumania, Bulgaria, Greece, and Albania. Its area is 98,725 square miles. In the peace treaty of 1947, Yugoslavia gained the state of Venezia Giulia plus the enclave of Zara and the islands of Cherso (Cres), Lussino (Losinj), Pelagosa (Pelagruz), and Pag at the expense of Italy.

Much of the coast is rocky and precipitous, rising inland to a mountainous plateau covering the western and southern part of the country. The eastern portion of the country contains a southern spur from the Carpathian mountains. The greater part of the surface is drained toward the east and the north by the Drava, Sava, and Morava rivers, which empty into the Danube. The Danube River, traversing the northern part of Yugoslavia and forming part of the country's Rumanian boundary, cuts through the eastern mountain barrier at the Iron Gate. The Iron Gate is a mountain pass through which the river formerly rushed over a plateau of rock 1400 feet wide. This point has been made navigable by extensive blasting at a cost of more than $10 million. The river valleys provide most of the country's arable land. Nearly one-half of the surface of Yugoslavia is covered with forest. Lumber leads the exports. The chief minerals are coal, lignite, iron, copper, lead, zinc, gold, salt, chromium, and antimony.

The most important industry is agriculture. The chief crops are wheat, corn, potatoes, barley, oats, sugar beets, tobacco, and temperate zone fruits. Silk culture employs many people. Large numbers of swine are fattened on the beechnuts and the acorns of the wooded land, while cattle and sheep graze on the higher mountain slopes. Flour milling, sugar refining, carpet weaving, tanning, and pottery are important industries. State ownership and control characterize the nation's postwar economic and agricultural systems. Tourism contributes immeasurably to the economy.

The inhabitants of Yugoslavia, estimated at 20,523,000 in 1971, are divided among three chief forms of religion, Greek Catholic, Roman Catholic, and Moslem. There are three universities. Belgrade is the capital and largest city.

CITIES AND OTHER POINTS OF TRAVEL INTEREST

The cities of Europe are distinguished by the richness of their historic associations, and, in many cases, by the wealth of their artistic adornment. Some of them, such as Athens and Rome, still preserve the visible evidences of the brilliant civilization which flourished in the southern part of the continent as early as 600 B. C. In others, the remains of outstanding interest are medieval structures—sublime cathedrals, or castles and dungeons of more sinister memories. Cities of southern Spain tell of Mohammedan enterprise; those of Italy remind us of the flowering of art known as the Renaissance; while the industrial cities of northern Europe often afford a curious blending of old interests and of new.

In World War II many European cities were largely destroyed or suffered extensive damage. In some places the historic buildings and monuments have been rebuilt or repaired, though many which were familiar to generations of American tourists have vanished forever.

The scenic beauties of Europe are not only grand in themselves but have the prestige that comes from centuries of description by travelers. The Alps have given us the term alpine, applicable to mountainous scenery of impressive beauty. The natural charm of the pleasure resorts is supplemented by all the attractions that can be suggested by ingenuity aiming to please vast numbers of tourists. The more noteworthy of these resorts are described in the following section, along with the cities and other places of especial interest on the continent.

In many instances, a city is known in English by a name different from that used by the inhabitants of the country in which it is located. In all such cases, the native name is given in bold-face type in parenthesis after the name commonly used by English-speaking people.

Alps. An irregular mountain system of south central Europe, occupying most of Switzerland and parts of France, Italy, Austria, and Germany. The system is 600 miles in length and has a width varying from 75 to 150 miles. It covers an area of about 85,000 square miles. The highest point is reached by Mont Blanc, 15,781 feet high. Other notable peaks with their heights are Monte Rosa, 15,203; Mischabel, 14,935; Lyskamm, 14,889; Weisshorn, 14,804; Matterhorn, 14,701; Dent Blanche, 14,318; Grand Combin, 14,164; Finsteraarhorn, 14,026; Aletschhorn, 13,803; and Jungfrau, 13,653.

The glaciers of the Alps number about 1200 and cover an area of 1600 square miles. The largest, called the Aletsch, has an area of 50 square miles. Other well-known Alpine glaciers are the Unteraar, the Gorner, the Viesch, the Mer de Glace, and the Miage, the last two being on Mont Blanc. The glaciers give rise to a number of mountain lakes, several of which have become proverbial for their beauty. The chief ones are Lucerne, Geneva, Como, Garda, and Maggiore. Water is often drawn from the bottoms of Alpine lakes to secure an all-year flow to develop electric power.

The Alps are cut by many passes, of which the principal ones have been pierced by tunnels for railroads or vehicular traffic. Under Saint Bernard pass, a two-lane tunnel 3.6 miles through the rock provides a roadway supported for an additional ten miles by concrete pylons. Railroad tunnels pierce the Brenner and Simplon passes and the Saint Gotthard and Mont Cenis mountains. A vehicular tunnel through 7.25 miles of rock under Mont Blanc was completed in 1964 to connect Italy and France. In 1976 a 10-mile, 120-yard vehicular tunnel, the world's longest, was completed in Switzerland. It runs from Goschenen on the northern side of the Alps beneath the St. Gottard range to Airolo in the Ticino area.

There are also numerous scenic railroads in the Alps and automobile roads which are marvels of engineering skill. These supplemented by cable cars giving access to mountain peaks make the Alps the most accessible region of superb mountain scenery in the world. The Swiss Alps and the Tyrol, in Italy and Austria, are among the most popular regions.

Amiens (F. *à'myăN'*; E. *ăm'ĭ-ĕnz*). A cathedral city of northern France, lying about 80 miles north of Paris. The Cathedral of Amiens, for magnificence and for richness of decoration, is not surpassed by any other Gothic building of the world. The city has important textile manufacturing interests and is widely known by tourists for its macaroons. During World War I, Amiens was made the headquarters of the British armies in France. Population, 101,677.

Amsterdam. The largest city and the statutory capital of the Netherlands, although the actual seat of government is The Hague. Amsterdam occupies a low site at the southwestern extremity of the Ijsselmeer and is connected with tidewater by the North Sea canal. The numerous canals, which divide the city into some 90 islands connected by almost 300 bridges, have given rise to the city's characterization as "the Venice of the North." Amsterdam's defenses consist of dikes, by the opening of which the whole district may be flooded.

The city is named after a dam built in 1240 across the river Amstel. Part of the site originally occupied by this dam is now the central square of the city and is called the Dam. From it the principal streets radiate in a semicircle. Nearby stand the New Church and the Royal Palace. In the former, a Gothic structure dating from 1408, the sovereigns of the Netherlands are crowned. The Royal Palace, belonging to the city, is the residence of the country's sovereigns when they are guests of Amsterdam. The Ryks, or State Museum, contains a number of paintings by Rembrandt, who, with the philosopher Spinoza, was among Amsterdam's most famous citizens. The city maintains a municipal abattoir, theater, pawnshop, and museum.

Amsterdam is the chief center of Dutch industry, commerce, and finance. Its diamond-cutting factories are the largest in the world. There are also shipbuilding yards, sugar, and oil refineries, and factories for making dyes, chemicals, glass, liquor, tobacco and steel products. The Bank of the Netherlands, situated in Amsterdam, is one of the leading financial institutions of Europe. The city is the seat of the University of Amsterdam and is the headquarters of the National Academy of Arts, the Royal Academy of Sciences, and the Royal Dutch Geographic Society. Amsterdam's botanical gardens are among the foremost in Europe. Population, 861,034. Greater Amsterdam, 911,248.

Antwerp (Antwerpen). A large city of Belgium, situated on the Scheldt River about 50 miles from its mouth in the North Sea. The river, 2200 feet wide at this point, provides Antwerp with one of the best harbors in the world. By means of 28 miles of quays, 3½ miles being granite and equipped with all modern appliances, the port handles merchandise often exceeding an annual total of one billion dollars. Besides its commerce, Antwerp is important for diamond cutting, sugar refining, and the manufacture of liquors, textiles, and cigars. Urban traffic is facilitated by two tunnels under the Scheldt River.

The most conspicuous building in the city is the Cathedral of Notre Dame, the construction of which was begun in the 14th century. It has a tower 400 feet high and contains three celebrated paintings by Rubens, whose tomb is contained in the splendid Church of Saint James. The richly decorated town hall was built in the 16th century. The art gallery contains a priceless collection of masterpieces by Rubens and Van Dyck, the latter having been born in the city. The Steen, part of an old castle dating from the 10th century, was formerly the seat of the Inquisition, but is now used as an archeological museum. Fine boulevards follow the line of the old city walls.

The city has had a stormy history. Founded in the 8th century, it had become, by the 16th century, the financial center of Europe and one of the chief commercial cities of the world. It was destroyed by the Spaniards in 1576. Napoleon revived the city. By improving its harbor, he hoped eventually to make Antwerp a rival of London. Population, 661,697.

Appian (*ăp'ĭ-ăn*) **Way.** A Roman road running from Rome to Brindisi in southern Italy, 446 miles. Begun in 312 B. C. by Appius Claudius as a public work, it is still in use over a considerable portion of its course. For several miles from Rome it is bordered by ancient tombs and the ruins of monumental buildings.

Arcadia. An inland district of the peninsula of Morea in Greece. Its ancient inhabitants long retained their primitive customs, unaffected by the Dorians who invaded the peninsula in the 12th century B. C. A pastoral poetry arose there in the last centuries of the pre-Christian era and gave support to a literary tradition, which represented Arcadia as a land of primitive simplicity and idyllic happiness.

Argonne Forest. A rocky wooded area northwest of Verdun in northeastern France. It was the scene, in September and October 1918, of one of the bloodiest battles ever waged by American troops. The capture of this forest by the Americans threatened the line of retreat of the German army.

ATHENS (**Athēnai**). The capital and largest city of Greece, situated in the southeastern portion of the country about five miles from the port of Piræus on the eastern shore of the Gulf of Ægina. The city stands in a plain surrounded on three sides by mountains. Athens is a financial, railroad, and commercial city of importance, but its industrial interests center chiefly in Piræus, where there are establishments for manufacturing cotton, flour, leather, chemicals, and rugs. Near Piræus lies Phalerum, the sea resort of Athens. Athens is named after Athena, the ancient Greek goddess of wisdom.

The Modern City. For several centuries following 500 B. C., Athens was the intellectual and artistic center of the civilized world and, architecturally, was one of the most beautiful cities on the earth. After many centuries of misfortunes, it was finally reduced to a Turkish village. When, in 1832, Greece became independent, Athens was chosen its capital and was rebuilt as a modern city.

The Square of Harmony forms a center from which radiate wide boulevards, two of them ending in Constitution square—the site of the royal palace and gardens. Between the two squares stand the government offices, the buildings of the Academy of Sciences, the National university, the National library, and the archeological colleges. Other notable modern structures include the Parliament buildings, the Palace of Justice, and the National Archeological Museum, the last housing a priceless collection of Greek antiquities. The city contains also the University of Athens, a beautiful library known as the Gennadeion, and the impressive Temple of Youth, headquarters of the Greek Y.M.C.A. There is a large stadium, in which the Olympic games were held in 1896.

The white marble, which is used in most of the public edifices, imparts to the city's architecture a distinctive and impressive brilliancy. The marble used in the ancient buildings has, through age, become tinged with a russet hue.

Ancient Buildings. The ancient city centered about a flat-topped hill, called the Acropolis. This hill is surrounded by a wall and contains four beautiful structures: the Propylæa, a building of mixed Doric and Ionic style, which serves as a stately entrance to the enclosure; the Temple of Victory, a small Ionic edifice beside the Propylæa; the Parthenon, which is the classic example of a pure Doric temple and is justly famed as one of the world's most beautiful buildings; and, finally, the Erechtheum, known best for its Porch of the Maidens, in which the columns take the form of Greek maidens, often called Caryatids. These four buildings were all erected in the 5th century B. C., but they still preserve much of their original impressiveness. The Parthenon was partially restored in 1930.

The chief of the ancient buildings outside the Acropolis are the arch of Hadrian, the Theseum, the open-air theater of Dionysus, the Temple of Zeus, the Tower of the Winds, and the monument of Lysicrates, the last being the earliest extant example of the Corinthian style. The Theseum is the best preserved of the ancient Greek structures. Of the 104 Corinthian columns of the Temple of Zeus, each of them 56 feet in height, only 15 remain erect today.

These ruined structures are the original models for the Greek style of architecture as it has been revived in recent times and employed in the erection of many modern buildings. Excavations are going forward continuously, the most stupendous project being that for unearthing the ancient Agora. Population, 1,852,709.

Athos (*ăth'ŏs*). A mountain of northern Greece, 6670 feet high, occupying the extremity of a peninsula in the northern part of the Ægean Sea. In ancient times it was noted as the scene of the shipwreck of Xerxes' fleet, which sailed to attack Greece in 492 B. C. Since the 9th century A. D., the mountain has been occupied by a group of fortified monasteries, now 20 in number. The control of the mountain was handed over by the Byzantine emperors to the monasteries, which have continued to exercise their rights of self-government to the present day. Under a constitution dated in 1045 A. D., women and female animals are excluded from the holy mountain. The monks, numbering 4800, support themselves by agriculture, fishing, and various handicrafts.

Avignon (*ä'vĕ'nyôN'*). A town of southeastern France, situated on the Rhone River about 30 miles from the Mediterranean Sea. Avignon is notable as the former residence of the popes, who made it their seat from 1309 to 1376. The city is built on a wall-girdled height, from the summit of which rise the cathedral and the impressive mass of the old papal palace. Population, 64,581.

Barcelona. The chief manufacturing center and, with the exception of Madrid, the largest city of Spain, located near the northeastern extremity of the country on the Mediterranean Sea. The city has a fine harbor and ranks as the second seaport in Spain. It is the commercial center of a rich fruit growing district. The chief manufactures are cotton, silk, and woolen goods, lace, leather, machinery, furniture, dyes, soaps, and drugs. Fruit, wine, olive oil, as well as manufactured goods, are among its exports.

The city dates from the 3d century B. C., when it was founded by the Carthaginian Hamilcar Barca, after whom it was called Barcino. From the 2d century A. D., the city has, in spite of varying fortunes, remained one of the chief commercial cities of southern Europe.

The older part of the city was formerly surrounded by walls, which have since been replaced by promenades. This section has, in general, narrow, irregular streets. Its chief thoroughfare, however, the Ramblas, which connects it with the "new town," has a handsome promenade on which are situated many of the principal buildings of the city, including one of the finest theaters in Spain. At the highest point of the Ramblas stands a famous 13th century cathedral in Spanish Gothic style. The "new town" is regularly laid out and has all modern improvements. Among the more recent buildings is the terminal station, one of the finest in Europe. The chief educational institution is the University of Barcelona. Population, 1,696,750.

Belfast. The capital and metropolis of Northern Ireland, situated on a small inlet in the northeastern part of the island. The city has an excellent harbor and contains immense shipyards, in which most of the White Star liners have been built. In addition to the linen textile industry, manufactures include the making of rope, liquors, tobacco goods, machine shop products, flour, and chemicals.

Belfast was incorporated as a city in 1888. It is the seat of Queen's university and Campbell college and has several fine churches, an art gallery, and a museum. Population, 399,270.

Belgrade (*bĕl'grād'*) (**Beograd**). The capital and largest city of Yugoslavia, situated near the center of the country's northeastern boundary at the confluence of the Save and the Danube rivers. Belgrade is an important railway junction and is the chief trade center of the country. The city is modern in appearance and has several institutions for higher education, including a university, a national library, a museum, and an academy of sciences. There are several fine Greek Catholic churches. Prior to its capture by the Austrians on Oct. 9, 1915, Belgrade was the capital of Serbia. Population, 585,234.

Belleau (*bĕl'ō'*) **Woods.** A forest ot northeastern France, 5 miles northwest of Chateau Thierry and about 42 miles east of Paris. It is celebrated for a bitterly contested battle waged there in June 1918, when American marines and regulars dislodged a strongly entrenched German force and captured the village of Bouresches, 2 miles south of the woods. The battle ground was dedicated in 1923 as a permanent memorial to the Americans who fell there. It was named Bois de la Brigade de Marine.

Bergen (*bûr'gĕn*). A seaport and codfish market on the southwestern coast of Norway. Bergen's fish exports are nearly half those of all Norway. The chief manufactures are ships, paper, and ropes. The buildings include a naval academy, an observatory, and a fishery museum. The city maintains a noted marine biological station and is annually the scene of an international fishermen's fair. Edvard Grieg, the composer, was born there. Population, 117,353.

BERLIN. The capital of prewar Germany. After World War II, it became a divided city, 188 of its 342 square miles being an enclave of West Germany and the remaining 154 square miles being the capital of East Germany. It lies about 50 miles from the Polish border to the east and nearly 100 miles from West Germany, which has access to it by railroad, by a principal highway from Helmstedt, by waterway from Hamburg, and by an air corridor. In 1961 the East Germany government built a concrete wall separating the sectors and mounted armed guards on it to prevent escape to the West.

Commerce and Industry. The old Berlin was the distributing point for a vast inland trade, being served by 12 trunk railroads and several waterways. Since the war, manufacturing has been concentrated chiefly in West Berlin, whose industries produce mainly clothing, electrical apparatus, locomotives, machinery and other steel products, pharmaceuticals, dyestuffs, porcelain, railroad cars, toys, and liquors.

Three-quarters of the old Berlin was destroyed by bombing and artillery fire in World War II. In 1948-49 the western sector was blockaded by the Russian military government, but the blockade was broken by a massive airlift from the west. Thereafter, restoration went forward rapidly, and manufacturing, commerce, and other civic activities grew apace.

Streets, Buildings, and Monuments. Streets are regularly laid out and flanked by handsome residences combined with numerous squares, parks, playgrounds, monuments, fashionable promenades, and splendid public buildings.

Berlin's most famous boulevard is Unter den Linden, so called from the double rows of lime, or linden, trees with

which it is planted. The street is 196 feet wide and leads from the former imperial palace, with its 600 rooms, to the Brandenburg Gate, which is the official point of passage between the East and West sectors. This gate is a triumphal arch, modeled on the Propylea in Athens and surmounted by a colossal bronze car of victory. On the boulevard is situated, among other impressive buildings, the palace of William I.

The Brandenburg Gate leads west into the Tiergarten, a magnificent park of 600 acres, which contains one of the largest zoological gardens in the world. The continuation of Unter den Linden into East Berlin is Liebknechtstrasse, formerly Wilhelmstrasse. It passes the Chancellery, once administrative center of Germany and scene of Hitler's suicide. The Reichstag building, erected in the Italian Renaissance style, remains as when gutted by fire in 1933.

Educational Institutions. Berlin is the chief intellectual center of Germany. The University of Berlin, founded in 1810, has numbered among its teachers Hegel, Fichte, Grimm, Niebuhr, Lipsius, Mommsen, and Einstein. Besides numerous technical institutions, there are free astronomical observatories, academies of art and of music, public libraries, botanical gardens, and many learned societies. Population of West Berlin, 2,190,577.

Berne. The capital and fourth largest city of Switzerland. The city is in the northwestern part of the republic and is picturesquely situated on a rocky bluff surrounded on three sides by the river Aar, a tributary of the Rhine. The name Berne is a corruption of the German word for bears, a number of the animals having been slain on the site when Berne was founded in 1191. A den of tame bears is maintained by the city, which has adopted the bear as its emblem.

Berne is noted for its manufacture of toys, engines, scientific instruments, and chocolate. It is the center of the international postal, telegraphic, railroad and copyright associations. The chief edifices are the magnificent Parliament building and a Gothic cathedral begun in 1421 but not completed until 1894. Population, 166,000.

Bingen (*bĭng'ĕn*). A town on the west bank of the Rhine River in Germany, 17 miles west of Mainz. Like many other towns on the Rhine, it has several picturesque ruins of feudal castles, the most notable of which is the Mouse Tower. In this tower, Archbishop Hatto is said to have been devoured by mice in 969 A. D. The Bingenloch, a famous whirlpool, is found a short distance down the river. Population, 20,210.

Birmingham. The second largest city of England, situated near the geographic center of the country. Being in close proximity to rich coal fields and large iron deposits, it was known for its iron products as early as the 16th century, and it has since become famous for its steel manufactures. Other industrial products include glass, jewelry, chemicals, automobiles, railroad cars, plated articles, pins, and hydraulic presses.

Birmingham has led the cities of England in municipal improvements. There are 17 parks and recreation grounds. An excellent school system provides elementary education, while museums, libraries, art galleries, botanical gardens, technical colleges, and an amply endowed university afford means for higher study. James Watt, John Bright, and Joseph Chamberlain are some of the distinguished names connected with the city. Population, 1,102,570.

Bologna (*bō-lōn'yä*). A city of northern Italy, located in a fertile plain at the foot of the Apennine mountains, almost midway between the Gulf of Genoa and the Gulf of Venice. It is an important railroad junction and has a large trade and extensive manufactures. The products for which the city is especially noted are macaroni, Bologna sausages, liquors, and canned fruit. Other industrial establishments include sugar refineries, rice mills, and railroad shops.

Bologna is believed to have been founded in the 8th century B. C. It figures in the career of Hannibal, Alaric, Charlemagne, and Napoleon. The city uses an aqueduct built by Augustus Cæsar. By a popular vote in 1860, Bologna became a part of the kingdom of Italy.

There are some 130 churches, several dating from the 11th century. One of the most noted is the San Domenico, where lies the body of Saint Dominic, the founder of the Dominican order. Bologna's art treasures include Raphael's portrait of Saint Cecilia. Two leaning towers survive from among 180 which Bologna possessed in the Middle Ages. One of the two is 163 feet high and inclines 10 feet from the perpendicular. The University of Bologna is the oldest existing university in Europe. Founded in the 11th century, it became famous as a law school and in 1262 had about 10,000 students, among whom were Dante and Petrarch. Galvani, one of the earliest investigators of electricity, was born in Bologna and lectured in the university. Population, 481,527.

Bonn (*bŏn*). A university city of central Germany, beautifully situated on the Rhine River, now the seat of government of the Federal Republic of West Germany. Establishment of the capital here has led to great expansion of departmental buildings. The University of Bonn, second only to that of Berlin among German universities, occupies the former palace of the electors of Cologne. The city also has a venerable cathedral and a Beethoven museum, the latter containing relics of the famous musician, who was born in the city. The principal manufactures are porcelain, office furniture, and stoneware. Population, 140,482.

Bordeaux (*bôr'dō'*). A commercial city of southwestern France, situated on the Garonne River at the point where it widens to form the Gironde River. It is connected by canal with the Mediterranean Sea. The chief article of export is wine, besides which hides, sugar, rice, cotton and woolen cloth, salt fish, and fruit are shipped abroad, mainly to South America. The city's industries include shipbuilding, canning, sugar refining, and the manufacture of casks, liquors, chemicals, leather, machinery, and pottery. Bordeaux is an important center for fishing fleets which annually visit the shores of Newfoundland and of Iceland.

The University of Bordeaux was founded in 1441. Among the more notable buildings of the city are the Grand Theater, the Church of Saint Croix, Saint Michael's Church, and the Cathedral of Saint André, the last dating from the 11th century. Montesquieu, Montaigne, and Rosa Bonheur were residents of Bordeaux.

Bordeaux was used as a port of disembarkation by the American forces during World War I. For a short period in 1914, it became the seat of the French government when Paris was menaced. Population, 249,688.

Boulogne (F. *bōō'lôn'y'*; E. *bōō-lōn'*). A fortified seaport of northern France, situated at the eastern extremity of the English channel. The city is the chief French station of the North Sea fisheries. It consists of a lower town,—the business part close to the harbor,—and an upper town built on a hill, from which, on clear days, the English coast may be seen. As a center for passenger traffic with England, Boulogne rivals Calais. During World War I, many American troopships landed their passengers in Boulogne. Population, 49,036.

Bradford. A manufacturing city in the north central part of England, the chief center in England for the manufacture of woolen textiles, and the leading wool market of the world. Silks, velvets, and foundry products are also manufactured. Bradford is substantially built, mainly of stone. Among the public buildings are Saint Peter's Church, the Mechanics Institute, the large, covered markets, and the Cartwright Memorial Hall, erected in memory of the inventor of the power loom. Population, 298,220.

Bremen (E. *brĕm'ĕn*; G. *brā'mĕn*). The second largest seaport of Germany. It lies in West Germany about 38 miles from the North Sea on both banks of the Weser River. The "old town" on the right bank is the business district, while the "new town" on the left is a well built residential section. The chief industrial products include ships, iron castings, machinery, refined sugar, tobacco, and cordage. It is the leading German fishing port.

Bremen is the capital of a small state of the same name, which retained its rights of self-government when it entered the German Empire. Population, 598,957.

Breslau (*brĕs'lou*) (**Wroclaw**). An important commercial and manufacturing city of Poland, situated on both banks of the Oder River. It has a large trade in raw materials and holds three annual fairs. The chief manufactures are textiles, steel products, railway cars, paper, and furniture. Breslau consists of an old town surrounded by five modern suburbs. One of the most notable buildings is the Protestant church, with a 300-foot steeple, founded in 1250 and dedicated to Saint Elizabeth. Population 477,300.

Brest. A strongly fortified seaport and one of the chief naval stations of France, located on a wide rock-bound harbor at the northwestern extremity of France. Most of the working population are engaged in industries related to naval maintenance. Between the town and the harbor mouth, the Cours d'Ajot, one of the finest promenades in Europe, skirts the shore. Brest was one of the principal ports used by the American Expeditionary Forces in World War I. A telegraph cable connects the city with Duxbury, Mass. Population, 130,867.

Brighton. The most celebrated seaside resort in England, situated on the English channel, 51 miles due south of London. A magnificent 4-mile promenade and driveway with two fine piers borders the coast. The most noteworthy building is the Royal Pavilion, in Oriental style occupied by George IV and succeeding British sovereigns. Population, 162,650.

Bristol. A maritime city of southwestern England, situated seven miles south of the estuary of the Severn, with which it is connected by the navigable river Avon. The city has long been noted for its extensive commerce and for its glassworks, potteries, sugar refineries, soap works, tanneries, tobacco, chocolate, shoe, and chemical factories, and shipyards. In the shipyards of Bristol was built, in 1838, the early steamship *Great Western*.

The city is the seat of Bristol university and two colleges. Besides libraries, museums, and art galleries, there are several churches of which the finest architecturally is that of Saint Mary Redcliffe, dating from the 14th century. From Bristol came the first settlers of Newfoundland as well as the island's discoverer, John Cabot. The city was at one time the residence of Southey and of Coleridge. Population, 429,370.

Bruges (E. *brōō'jĕz*; F. *brüzh*). A decadent commercial city of western Belgium. Prior to the 16th century, Bruges was a flourishing center of woolen manufacturing. Among the many medieval structures which the city has preserved from its more prosperous days are the Church of Notre Dame and les Halles, the Market Hall, whose tower, 352 feet in height, contains a chime of 48 bells. This tower was celebrated by Longfellow in his poem "The Belfry of Bruges." The port of Bruges is Zeebrugge, 8 miles distant, which was a German submarine base during World War I. The name of the city means bridges and was applied in allusion to the 54 bridges constructed across the numerous canals which intersect the city. Population, 52,220.

Brünn (*brün*) **(Brno).** An important commercial city of south central Czechoslovakia. Its manufactures include woolen goods, hardware, flour, refined sugar, and machinery. Brünn has several churches of attractive medieval architecture and a beautiful synagogue built in the Saracenic style. The city is a trading center for a thickly populated district. Population, 328,316.

Brussels (Bruxelles, or **Brussel).** The capital and largest city of Belgium, situated in the central part of the kingdom. It consists of an upper town,—the new and fashionable quarter,—and the lower, or old, town, devoted to commerce and industry.

Its magnificent boulevards, beautiful squares and parks, and imposing buildings make Brussels one of the most beautiful cities of Europe. The more notable buildings include the Hôtel de Ville, with its open-stonework spire, 374 feet high, and the sumptuous Greco-Roman Palais de Justice. The Church of Sainte Gudule, begun in 1220, is celebrated for its marvelous stained-glass windows. The royal library, the museums, and the art galleries contain many masterpieces of Flemish painters. The University of Brussels is one of the very few European universities which have been founded without the co-operation of church or state. The city has numerous schools and scientific societies.

Brussels suffered severely from the German occupation during World War I. Since that time, however, its industries have resumed their production of Brussels lace, carpets, furniture, steam engines, and other articles manufactured before the war. The city is also the railroad center of the country. Population, 1,074,586.

Bucharest (*bōō'kȧ-rĕst'*; *bū'-*) **(Bucaresti).** The capital and largest city of Rumania, located in the central southern part of the country. Since 1948 it has been the seat of the Cominform (Communist Information Bureau). Bucharest has an extensive commerce in petroleum, cereals, and timber. The industries include oil refining and the manufacture of flour, liquors, chemicals, and brick.

The city's chief attractions are the splendid public gardens and the bright cupolas of the numerous Greek Catholic churches. Among the more imposing structures are the Royal Palace, the National university, the Palace of Justice, and several fine monuments. The customs of the inhabitants exhibit a blending of Oriental and Western influences. The name Bucharest is a corruption of a Rumanian word meaning city of joy. Population, 1,372,937.

Budapest (*bōō'dȧ-pĕst'*). The capital and largest city of Hungary, situated in the central northern part of the country on the banks of the Danube river. Budapest comprises the former city of Buda on the right bank and of Pest on the left bank. The two are connected by six bridges, including two suspension bridges which are among the longest in Europe. These bridges were bombed by the U. S. Air Force in 1944–45.

Buda, the older section, which was founded by the Romans in the 2d century A. D., is built on two hills and contains the royal castle, the government offices, and the former residences of the aristocracy. The newer town, Pest, founded by the Huns under Attila in the 5th century A. D., is built on a low plain. Pest is the commercial, industrial, and intellectual center of the city. The city was largely in ruins in 1945 when the Russians expelled the occupying Germans.

The city's commercial interests are of great importance. Budapest is the railroad center of Hungary and is further served by the Danube, the chief waterway of the country. Population, 1,960,000; with suburbs, 1,970,000.

Cadiz (*kȧ'dĭz*). An Atlantic port on the south coast of Spain. Cadiz is one of the most ancient cities in Europe. Founded by the Phœnicians, 1100 B. C., Cadiz was captured in turn by the Carthaginians, Romans, Goths, Moors, and Spaniards. The town is still protected by walls and fortresses. When Spain was mistress of most of the New World, Cadiz was the emporium of American commerce and was a city of vast wealth and importance. Today its trade is small, the exports being principally salt, wines, olive oil, and fruits. Population, 117,871.

Calais (*kȧl'ā*; *kȧl'ĭs*). A fortified port of northeastern France, situated on the Strait of Dover near its narrowest part. Calais is the chief point of disembarkation for travelers from England, being only 21 miles from the English coast. It has considerable commercial, manufacturing, and shipbuilding interests and is the chief center in France for the making of lace.

Calais was held by England from 1347 to 1558. During World War I, it was used by England as the principal point of disembarking troops for France. Population, 70,707.

Cambrai (*kȧN'brĕ'*). An industrial town of northern France, noted for its manufacture of linen and of cotton textiles. The city has given its name to the fabric known as cambric.

In the vicinity of Cambrai, on Nov. 20, 1917, was fought the battle in which tanks were first used on a large scale. Population, 32,601.

Canterbury. A cathedral city in the southeast of England, lying south of the Thames and about 56 miles east of London. Christchurch Cathedral is the crowning architectural feature of the city. Although the cathedral was a target for German bombers during World War II, it was not directly hit. Nearby buildings, however, were destroyed. The Archbishop of Canterbury is, next to the king, the highest official of the Anglican Church. Among the distinguished Catholic archbishops who, prior to the Reformation, presided over the see, were Saint Augustine, Lanfranc, Anselm, and Thomas à Becket, the one last mentioned having been murdered in the cathedral. The building contains, among other tombs, that of Henry IV and of the Black Prince. The city has many interesting ruins, including those of Canterbury castle, a fortress of Norman construction. A public drinking fountain commemorates Marlowe, who was a native of Canterbury. Population, 32,020.

Cantigny (*kȧn'tēN'y'*). A village of northern France, 18 miles south of Amiens. On May 28, 1918, it was the scene of the first American offensive in World War I.

Capri (*kȧ'prē*). A beautiful, rocky island at the entrance of the gulf of Naples, Italy, visited annually by more than 60,000 tourists. Its area is nearly 6 square miles, and its highest point is about 2000 feet above the sea. One of its most remarkable features is the Blue grotto, the roof and sides of which are composed mostly of stalactites. The grotto is on the coast and is called blue because the light, refracted in passing through the water at the cave's mouth, causes the interior of the grotto to appear blue. Capri is the scene of Norman Douglas's famous modern novel, *South Wind* (1917).

Capri was anciently famous for the palace there to which the Roman emperor Tiberius retired in order to spend his last years in pleasures. It had also a large Roman lighthouse, the remains of which are still visible. A more recent ruin is that of Barbarossa, a castle named after a pirate who partially destroyed it in 1544. Population, about 7000.

Cardiff. The principal seaport and largest city of Wales, situated at the southeastern extremity of the principality near the northern coast of Bristol channel. The city is the largest coal exporting port in Europe and ranks among the largest ports of England in its total shipping tonnage. Besides coal, its chief exports are iron and steel products, machinery, railroad cars, and vehicles. Its docks cover more than 200 acres, and there are 7 miles of wharves. In Cathays park, at the center of the city, is one of the finest groups of public buildings in Great Britain. Near by is Cardiff castle, which embraces structures dating from Roman and medieval times. Cardiff is also the seat of University College of South Wales. Population, 259,700.

Carrara (*kȧr-rä'rȧ*). A city of northern Italy celebrated for its marble quarries. It is situated 3 miles inland from the eastern extremity of the Gulf of Genoa in a valley surrounded by marble hills. Most of the city's buildings are of marble, and there is a museum containing numerous statues and Roman antiquities discovered in the vicinity. Population, 37,386.

Cartagena. A Mediterranean port and strong naval station in the southeastern part of Spain. The chief

industries are tunny fishing, shipbuilding, lead smelting, glass blowing, ironworking, and the manufacture of cordage and of other esparto grass products. The city is well built and is still surrounded by walls.

Cartagena was named after the city of Carthage. The city was founded about 243 B. C. by Hasdrubal, a Carthaginian general, who called the city *Carthago Nova*, "New Carthage." It was captured by the Romans in 210 B. C. and afterward was occupied successively by the Vandals, Moors, Spaniards, English, and French. Population, 42,424.

Catania (*kä-tä'nyä*). An Italian city on the eastern coast of Sicily, situated at the southeastern base of Mount Etna. The city has broad, well kept streets and many fine public buildings. A large trade in agricultural products is carried on in Catania, and there are important manufactures of linen, cotton, silk goods, and art objects of lava, wood, and marble. The chief attraction is Mount Etna. The city contains the remains of an ancient theater.

Catania was founded by Greeks in 729 B. C. and was held successively by the Carthaginians, Romans, Goths, Saracens, Normans, and the rulers of Aragon, from whom it passed to Italy. Population, 391,709.

Channel Islands. A cluster of islands lying in the English Channel near the northwestern coast of France, of which the principal ones are Jersey, Guernsey, Alderney, and Sark. Originally a part of the Duchy of Normandy, they have belonged to Great Britain since the Norman Conquest. Although rocky, about half of their 75 square miles is arable.

The Channel Islands are much frequented by tourists. Jersey contains a gorge more than 1000 feet deep in the cliffs at Crabbe. Other features of the islands include a picturesque natural archway of rock on Dixcart bay; a feudal manor house at Samares, dating from the 11th or 12th century; and Mousterian caves which, when explored recently, exhibited the remains of Neanderthal men, of the woolly rhinoceros, the cave hyena, and other animals now extinct. The state of New Jersey was named after the island of Jersey. Population, 113,416.

Chateau Thierry (*shä'tō' tyĕ'rē'*). A town in the northern part of France, on the Marne River 47 miles east and slightly north of Paris. At this point, in June 1918, American troops engaged German forces advancing toward Paris and effectively checked their progress. Several weeks later, a general counter attack swept the Germans back a distance of many miles. The town is named after a castle in the neighborhood, which was built by Charles Martel for the Frankish king Thierry IV. On July 15, 1923, a monument commemorating the American victory was erected in a square of the town, renamed United States place. Population, 9356.

Chemnitz (*kĕm'nĭts*) (**Karl-Marx-Stadt**). An industrial city of East Germany situated at the base of the Erzgebirge Mountains. The principal manufactures include locomotives and engines, textiles, hosiery, carpets, chemicals, and dyestuffs. Founded as a market town in 1143, Chemnitz has a varied but unbroken history as an industrial city extending from the 13th century until the present. Population, 294,973.

Cherbourg (*shĕr'bo͝or'*). A strongly fortified French naval station near the center of the country's northern coast on the English channel. Its ocean railroad station, opened in 1933, is one of the largest buildings in France. It was from this port that the Confederate cruiser, the *Alabama*, was forced by the French authorities to put out to sea before it was sunk by the United States vessel, the *Kearsarge*. Population 37,096.

Coblenz (**Koblenz**). A commercial and manufacturing city of West Germany, beautifully situated at the confluence of the Moselle and the Rhine River. It was rich in old churches and art monuments until World War II, when most of the city was destroyed.

Coblenz has an active trade in grain. Its manufactures consist mainly of Moselle wine, ships, hats, machinery, pianos, and lacquered wares. The finest edifice is the government building, in which are centered the administrative activities of the province of Rhenish Prussia. Saint Castor's church, founded in 836, ranks among the oldest in Germany. Population, 99,240.

Cologne (*kō-lōn'*) (**Köln**). A large commercial and manufacturing city of central West Germany, beautifully located on the left bank of the Rhine river. *Eau de Cologne* is a distinctive product. The chief manufactures are leather goods, chemicals, starch, textiles, rubber goods, machinery, metal wares, beet sugar, tobacco products, and chocolate.

The outstanding feature of Cologne's architecture is the Gothic cathedral, begun in 1248 and completed in 1880. Two of its towers rise to a height of 512 feet. The cathedral, though damaged, survived World War II, in which most of the other Romanesque and Gothic buildings perished. The Church of Saint Ursula is reported to contain the bones of 11,000 British virgins who were massacred near Cologne on their way to Rome. The Virgin islands in the West Indies owes its name to this tradition.

Cologne was founded in the 1st century A. D. under the name of Colonia Agrippina, of which its modern name is a corruption. Rubens, the painter, lived in the city, and one of the local churches contains the tomb of John Duns Scotus. Population, 861,027.

Copenhagen (*kō'pĕn-hā'gĕn*) (**Köbenhavn**). The capital and largest city of Denmark, situated on a deep, safe, and capacious harbor on the northeast shore of the island of Zealand. Across the harbor, on the island of Amager, is the modern suburb of Christianshavn. Copenhagen commands the sea highway from the Baltic to the North Sea and was at one time the chief distributing mart of the Baltic trade. To offset the advantages given by the Kiel canal to Germany's seaports, Copenhagen, in 1894, made part of its harbor a free port. Shipbuilding is the chief industry. Among the manufactures are agricultural machines, porcelains, textiles, sugar, watches, and chemicals.

A characteristic feature of Copenhagen is the large number of spires, which occur on many public buildings as well as on the churches. The Church of Our Redeemer has a winding staircase built outside the spire 295 feet to its top. Copenhagen is the seat of the University of Copenhagen and is the headquarters of many learned societies. The Thorvaldsen Museum contains over 300 works executed by Thorvaldsen, Denmark's greatest sculptor. Hans Christian Andersen was one of the city's most distinguished residents. Population, 1,377,605.

Cordoba (*kôr'dô-vä*). An inland city of southern Spain, located on the Guadalquivir River. The city was founded by the Phœnicians and attained to considerable importance under the Romans. It later became the metropolis of the Moors in Spain and, from the 9th to the 12th century, was one of the greatest centers of commerce in the world. The Mosque of Cordoba, now used as a Catholic cathedral, is the most magnificent example of Mohammedan architecture in Europe. The city is now in decline, its manufactures being confined largely to textiles, gold and silver filigree work, and cordovan leather. The last named article obtained its name from Cordoba. Cordoba was the birthplace of the Roman poet Lucan, of the two Senecas, and of the Arab philosopher Averroës. Population, 214,296.

Cork. A port of central southern Eire, situated on a capacious natural harbor formed by the estuary of the River Lee. It has a lower harbor, Cobh, formerly Queenstown, located at the river's mouth, an important Irish port of call for trans-Atlantic liners. A heavy trade in foodstuffs is carried on with England. The city's chief manufactures are leather, liquors, gloves, fertilizers, and textiles.

Among the finest buildings are the Anglican and the Catholic cathedral, both dedicated to Saint Finn Barr, who founded the city in 622 A. D. The Church of Saint Anne Shandon has a notable peal of bells. Other features of the city are University college, a school of science and of agriculture, and a public park, 240 acres in extent. Population, 122,146.

Coventry. An industrial city of central England, noted for its manufacture of automobiles, ribbons, artificial silk, telephone equipment, and electric motors. Coventry is a very old town and was for centuries the scene of an annual pageant commemorating the ride of Lady Godiva. According to tradition, she agreed to ride naked through the streets in order to save the citizens from certain exactions, her husband, Earl Leofric, having demanded this action as a condition of relieving the townspeople. The pageant was last celebrated in 1887. Saint Mary's Hall, built in 1450, is one of the finest examples of ornamental architecture in England. Much of the city, including a 14th century cathedral, was destroyed by bombing in World War II. The latter was replaced by a magnificent cathedral in modern architectural style. Population, 331,950.

Dardanelles. A narrow channel, 42 miles long and 1 to 5 miles wide, joining the Sea of Marmora and the Ægean Sea. The territory about the strait, affording an excellent defense of Istanbul from the West, was the scene of a costly offensive against Turkey during World War I. After the war, it was placed under the control of an Allied commission, but Turkey resumed control in 1936.

The ancient name of the Dardanelles was Hellespont, across which, in spite of its strong current, the mythical Leander is said to have swum each evening to visit Hero. Lord Byron swam the Hellespont at the point where Xerxes crossed it in 480 B. C.

Dnepropetrovsk. A large and rapidly developing industrial city of the Russian Ukraine located at the junction of the Dnieper and Donets rivers. Its major industries are iron and steel, machine construction, chemicals, and food products. The city shared in the hydroelectric development of the vast Dnepr dam, destroyed in 1941, but since restored. Its population is 738,000, more than double that of 1926.

Dortmund (*dôrt'mo͞ont*). A railway center and manufacturing city of central West Germany in the northern part of the Ruhr district. Located in the midst of rich coal mines, the city has become an important point for the manufacture of steel products, including machinery, wire ropes, rails, mining equipment, and safes. Among other products are flour, lumber, and liquors. Since 1900, its population has more than tripled, standing, according to the latest reports, at 657,087. Largely devastated in World War II, it was promptly rebuilt.

Dover. A heavily fortified port and favorite summer resort of England, situated at the southeastern extremity of the country. White chalk cliffs tower nearly 400 feet above the harbor, and, on clear days, afford a view of the opposite coast of France, 21 miles distant. The chief industrial products are ships, sails, rope, and flour. Towering 375 feet above the sea is Dover Castle, covering 35 acres, which includes within its ancient walls a Roman lighthouse. Population, 36,080.

Dragoman. Picturesque Bulgarian town at the easterly end of the Dragoman Pass, near the Yugoslavian frontier. Bernard Shaw made it the scene of his play, *Arms and the Man*, which was later turned into the opera, *The Chocolate Soldier*. The famous international train, the Orient Express, stops at Dragoman for customs inspection.

Dresden. An industrial city of East Germany. It is situated on the Elbe River and is an important railway center. The chief manufactures include pianos, confectionery, silverware, jewelry, chemicals, glassware, and metal goods. Dresden china is made at Meissen, a suburb.

In World War II about 60 per cent of the city, with most of the art and architectural monuments, was destroyed. Since then many art treasures, including Raphael's "Sistine Madonna," which were safely stored outside the city during the war, have been transferred to Russia Population, 507,470.

Dublin. The capital and largest city of Eire, situated on an inlet near the center of Ireland's eastern coast. A large part of the country's exported foodstuffs are handled through the port of Dublin. Liquors are made in considerable quantity.

Dublin as a whole, with its fine bay, wide streets, spacious squares, magnificent 2000-acre park, massive public buildings, and beautiful suburbs, is one of the handsomest capitals in Europe. Christ Church, in Early English Gothic style, was begun in 1038 by a Danish king of Dublin. Saint Patrick's Cathedral is about 700 years old. The city has statues of O'Connell, Burke, Goldsmith, and many other famous Irishmen. The University of Dublin is the chief educational institution. Population, 568,772.

Duisburg (*düs'bo͝orĸ*). A manufacturing city of central West Germany, in the Ruhr district. Its quays, built along canals and on the Rhine and the Ruhr rivers, are said to constitute the largest river harbor in the world. The chief commodities handled are coal and the products of the city's industries—iron and steel products, chemicals, liquors, asphalt, varnish, furniture, and tobacco. The former cities of Duisburg and Hamborn were combined in 1929. Population, 483,993.

Düsseldorf (*düs'ĕl-dôrf*). A manufacturing city of West Germany, situated on the right bank of the Rhine at the influx of the Düssel River. The harbor is spacious and well equipped, and there is a large export trade. The city has great iron and steel industries and textile manufactures. Chemicals, tobacco goods, chocolate, beer, paper, glass, and musical instruments are also made.

Destruction of Düsseldorf in World War II was widespread and drastic. In a situation between the Ruhr coal and steel area and the Federal capital at Bonn, Düsseldorf is becoming more and more the industrial and banking center of West Germany. It is also tending to lead in German commercial development of women's fashions. Population, 698,421.

Edinburgh (*ĕd"n-bŭr-ô*). The second largest city of Scotland. It is built near the south shore of the Firth of Forth, which is here spanned by a bridge 1½ miles in length. Edinburgh is the seat of the supreme court of Scotland and was the seat of government before the country united politically with England. The chief industries include printing and publishing, and the manufacture of liquors, leather, flour, and rubber goods.

Edinburgh consists of an old and a new section. Through the latter runs the magnificent Princes street, one of the finest thoroughfares in Europe. Near it stands the beautiful Scottish American war memorial. Among the city's points of interest are Holyrood Palace; Saint Giles Church, which has a memorial tablet to R. L. Stevenson designed by Saint-Gaudens; a magnificent monument to Sir Walter Scott; a small Greek temple erected to the memory of Robert Burns; and Calton cemetery, which contains a statue of Abraham Lincoln with a freed slave kneeling at his feet. Edinburgh has a handsome library donated by Andrew Carnegie. There are numerous educational institutions, the most famous of which is the University of Edinburgh. The predominance of literary elements in the city's population, combined with its picturesque location, has won for it the name of "modern Athens."

The city was named after Edwin, king of Northumbria, who seized it in the 7th century A. D. and built a fortress on Castle rock, a precipitous height which dominates the city. The Royal Castle now stands on the site of Edwin's fortress. Population, 467,986.

Essen. A steel manufacturing city of West Germany, situated in the Ruhr district and surrounded by rich coal and iron deposits. The recent industrial growth of the city is due mainly to the activities of the Krupp corporation. The town, however, traces its origin to 873 A. D., when construction began on the cathedral, which is one of the oldest churches in Germany. Population, 721,182.

Etna. The largest active volcano in Europe. It is an isolated mountain, 10,705 feet high, in northeastern Sicily near Catania and has a base 90 miles in circumference. On its eastern side is a former crater, now a vast amphitheater with nearly precipitous sides 3000 feet in height.

The first recorded eruption of Etna was in the 8th century B. C. Another, occurring in 477 B. C., is graphically described in Æschylus' *Prometheus Bound*. Later eruptions of a violent character took place in 1169, 1527, 1669, 1693, 1852, 1864, 1879, 1911, 1923, and 1928. In that of 1669 more than 20,000 people were killed. An observatory and a house for the convenience of travelers have been erected near the chief crater. A large part of the world's supply of sulphur came formerly from Mount Etna.

Fingal's Cave. A remarkable cave of basalt formation, on Staffa, a small island off the central western coast of Scotland. The cave extends from the shore a distance of 227 feet within a rocky height and has an arch 66 feet high. Its maximum width is 42 feet. The color effects of the columnar basalt formation are no less striking than the weird sounds produced by the action of wind and wave as they play upon the opening of the huge cave.

Florence (Firenze). A city of north central Italy, lying in a fertile valley near the Apennine mountains. Florence is, next to Rome, the most celebrated Italian city, being noted for its illustrious history and for its art treasures.

The Cathedral of Florence is the city's outstanding structure. Founded in 1296, it occupied about 200 years in construction. Its dome was planned by Brunelleschi. The bell tower of the cathedral was built by Giotto. This tower and the bronze doors of the baptistery, designed by Ghiberti, have enjoyed renown for centuries. The Franciscan church Santa Croce contains the tombs of Galileo, Michelangelo, Machiavelli, and many other distinguished men. The picture galleries contain some of the best works of Titian, Andrea del Sarto, Botticelli, Rubens, Raphael, and other great painters. Among the notable statues are the "Venus de' Medici," "Dancing Faun," and "Knife Grinder."

The city has famous academies of art, a museum of natural history, a university, a botanical garden, a large astronomical observatory, and a number of libraries, chief of which is the Laurentian library founded by Lorenzo de Medici. Florence was the birthplace of Dante and of Florence Nightingale.

The industries of the city include the manufacture of silks, glassware, porcelain, and objects of art, especially mosaics, wood carvings, majolica chinaware, stained glass, and jewelry. Florence was founded in the 2d century B. C., but the period of its greatest prosperity was in the 13th century A. D., when it was an independent city-state. Population, 454,858.

Flushing. A strongly fortified Dutch seaport, built on an island at the western extremity of the Netherlands. There is a large passenger traffic between Flushing and English ports. The city was the birthplace of Admiral de Ruyter, one of Holland's greatest naval heroes. Population, 29,141.

Folkestone. An ancient town and seaport of southeastern England, situated on the Strait of Dover. Folkestone has daily steamer communication with Boulogne in France and is also popular as a summer resort. Harvey, the discoverer of the circulation of the blood, was born in this city. Population, 43,470.

Frankfurt (Frankfort). Important commercial, industrial, and transportation center in central West Germany, on both sides of the lower Main River, an eastern tributary of the Rhine. It is the headquarters of the American armed forces in Europe, and of the U. S. zone high commissioner. The city has important literary and historical associations.

About 55 per cent of Frankfort was destroyed in World War II, but some of the most famous buildings, including Goethe's birthplace, have been rebuilt. It has a university, and other colleges and institutes. There is a monument to Gutenberg, the inventor of movable type. Frankfort was formerly the electoral city of the Holy Roman Empire, and, after 1816, the German Parliament held its sessions there. Population, 684,798.

Freiburg (*frī'bo͝orĸ*). A city in the southwestern extremity of Germany, noted for its magnificent Gothic cathedral. This edifice, built of red sandstone, was begun in 1122 and was completed in 1513. It is admired for the delicate symmetry shown in its design as well as for its splendid tower, which is 386 feet high. Population, 150,437.

Geneva (**Genève**). A beautiful city of western Switzerland, situated at the lower end of Lake Geneva where its waters flow into the Rhone River. The city covers two islands in the river, one of which, called Rousseau's island, is a public pleasure ground commemorating the revolutionary writer, who was a native of the city. The left bank of the river is occupied by the old city and the business section, while, on the right bank, is the quarter called Saint Gervais, mainly residential in character. The latter district contains numerous hotels for the accommodation of the many tourists who enter Switzerland by way of Geneva.

The University of Geneva was originally founded as an academy in 1559 by Calvin, who made Geneva the chief center of Protestantism in the 16th century. Swiss heroes of the Reformation are further commemorated in Geneva by a recently erected monument entitled the "Wall of the Reformers." The manufactures of the city consist principally of clocks, watches, jewelry, enameled ware, and scientific instruments. Geneva, formerly the headquarters of the League of Nations, is now the European headquarters of the United Nations, and of many other international organizations, including the Red Cross. The city is predominantly French in language and culture. Population, 169,700.

Genoa (*jĕn'ō-ä*) (**Genova**). A commercial city of northeastern Italy, picturesquely situated at the head of the Gulf of Genoa. The city is strongly fortified against attacks by sea or land. Rail connections render it the sea outlet for much of the foreign trade of northern Italy, Switzerland, and southern Germany. The manufactures include foundry and other metal products, leather, cotton, cement, motor cars, crystallized fruits, and hats, and the city is also noted for its production of works of art in gold, silver, ivory, alabaster, and coral. It has large shipbuilding facilities and the largest dry dock in the Mediterranean Sea.

Among the notable examples of Genoa's many fine edifices are the ducal palaces, the residences of the doges in the days of the city's independence; the Cathedral of San Lorenzo, containing what is said to be the Holy Grail; the Church of Santissima Annunziata; and the Teatro Carlo Felice. The last named edifice was built in 1828 and ranks among the largest theaters in Italy. Genoa has an imposing sculptural group in honor of Columbus. Population, 845,427.

Ghent (**Gent** or **Gand**). A city of western Belgium, located on the Scheldt River and connected with the North Sea by a ship canal. The city is divided into islands by smaller canals, which are spanned by numerous bridges. The older part of Ghent has narrow, gloomy streets, but the newer part is laid out with wide avenues, flanked by fine houses.

Ghent contains the Cathedral of Saint Bavon, in which is the celebrated "Adoration of the Magi" by Van Eyck. There is also a great walled and moated nunnery, which, since its foundation in the 13th century, has been known for the production of exquisite lace. Ghent's principal manufactures are cotton and linen textiles, leather, and refined sugar, and the city has an active export trade in flowers. The emperor Charles V was born in Ghent, where, also, was signed the treaty which closed the War of 1812. Population, 232,736.

Giant's Causeway. A line of three perpendicular cliffs on the northeastern coast of Ireland. According to a legend, they were the beginning of a causeway to be built by giants across the channel to Scotland. They are formed of vertical basalt columns, mainly hexagonal in form and fitting closely together. The three cliffs are called the Little Causeway, the Middle Causeway, and the Grand Causeway. The last has a width of 60 to 120 feet and extends about 500 feet into the sea. On the Middle Causeway is the famous "wishing chair." The vicinity abounds in special points of interest, such as an amphitheater of natural formation and ruined castles perched on the top of isolated crags.

Glasgow. The third largest city in Great Britain situated on the Clyde River somewhat southwest of the geographical center of Scotland. Its harbor has been elaborately improved at the cost of 40 million dollars and has some 8 miles of quays. Glasgow's shipyards are the largest in the world. The industrial development is due partly to the city's location in the midst of extensive deposits of coal and of iron. The chief manufactures, apart from ships, comprise iron and steel products, textiles, coal, paper, chemicals, and whisky.

Glasgow is conspicuous for its successful management of civic operations and improvements, which include the erection of large numbers of modern apartment houses. There are many institutions for technical and higher education, of which the most important is the University of Glasgow. The municipal art gallery contains the finest collection of paintings in Great Britain outside of London, including Whistler's portrait of Carlyle. Saint Mungo's Cathedral, built between 1197 and 1446, is a beautiful example of Early English architecture. It stands on the site of a church erected in the 6th century by Saint Mungo, the patron saint of Glasgow. Population, 960,527.

Gorkiy, formerly **Nizhni Novgorod.** A city of Russia, on the Volga River about 270 miles east of Moscow. From remote antiquity, the city has been famous for its annual fair, one of the greatest of the entire world. Prices of many important commodities throughout Russia depended on those prevailing on this market. Merchandise totaling in some years over 20 million tons changed hands between August 1 and September 15.

The Soviet government chose this city as its chief center for the manufacture of automobiles. About fourteen miles from the old town, an enormous automobile factory, the largest in Europe, was placed in operation in 1931. About it was built a model soviet city designed for 60,000 inhabitants. One-third its area was devoted to parks. Residential units were built to accommodate 200 people per unit, each being equipped for communal meals and provided with facilities for amusement and instruction. The name Nizhni Novgorod was changed in 1932 to Gorki in honor of the famous writer, who was born there in 1868. Population, 1,120,000.

Göteborg (*yû'tĕ-bôr'y'*). The second largest city of Sweden, situated in the southwestern part of the country at the mouth of the Göta River, which discharges into the Kattegat. The town was founded in 1618 by Gustavus Adolphus, but, in consequence of numerous fires, it has been largely rebuilt in recent times. It has numerous fine buildings and broad, well shaded streets, those near the river having canals running through their centers. Favored by an excellent harbor open all the year round, Göteborg conducts much of the country's foreign commerce. The industries comprise shipbuilding, textile weaving, dyeing, iron-working, brewing, and the manufacture of tobacco, furniture, paper, and leather. Population, 443,292.

Granada. An inland city of southeastern Spain, lying at the base of the Sierra Nevada about 40 miles from the Mediterranean coast. The city, having been formerly one of the chief centers of Moorish civilization in Spain, has a partially Oriental appearance. The residential section of the Moorish nobility is now in ruins and is occupied largely by gypsies. Granada's outstanding edifice is the Alhambra, a magnificent Moorish palace celebrated in America by Washington Irving's book *The Alhambra*. The cathedral, begun in 1529, commemorates the reconquest of Spain by the Christian powers. Granada has a university founded in 1531 by the emperor Charles V.

The city is in a fertile district containing groves of orange, lemon, and fig trees. Its manufactures include textiles, paper, leather, flour, macaroni, chocolate, and soap. Population, 150,186.

Graz (*grăts*). A commercial and industrial city of Austria, situated in a beautiful valley at the eastern extremity of the Alps Mountains. The principal architectural attractions include a Gothic cathedral dedicated to Saint Ogidius and noted for its exquisite stained-glass windows, a mausoleum containing the remains of Emperor Ferdinand II, and the parish church, which, built in 1520, is adorned with an altarpiece by Tintoretto. Graz has a university, founded in 1573.

A rich coal district is near the city. The manufactures comprise iron and steel goods, optical instruments, chemicals, paper, and lithographs. Graz is an important railroad and trade center. Population, 237,080.

Hague, The (**'s Gravenhage**). The capital of the Netherlands, situated in the southwestern part of the kingdom about two miles from the North Sea. The city is chiefly occupied with the business of governing, although there are manufactures of gold and silver lace, jewelry, and articles of iron, brass, and copper.

The Hague has broad, shaded streets, intersected by picturesque canals and lined by many fine edifices. One of the most noted buildings is the Mauritshuis, which contains masterpieces by Rembrandt, Rubens, Van Dyck, and others. The city is the headquarters of the Permanent Court of International Justice and of the International Court of Arbitration. These courts sit in the Carnegie Peace Palace, which was erected in 1913, partly through the generosity of Andrew Carnegie. Other features of the city are the royal library, the various government buildings, Willem's park, and the royal villa Huis-ten-Bosch, "House in the Woods," which stands in the suburbs amid the magnificent forests separating the city from its seaside resort, Scheveningen. Population, 589,862.

Hamburg. The largest city of West Germany, excluding Berlin, and one of the largest seaports in the world. In northwestern Germany south of the Baltic peninsula, it is connected with Cuxhaven on the North Sea, 75 miles distant, by the Elbe River. Hamburg's two harbors are on two small lakes made by damming the Alster, a stream flowing through the city. The docks are 20 miles in

length and are among the best equipped in the world. Hamburg is one of the chief coffee markets of the world and handles immense quantities of wool, grain, cotton, ironware, tobacco, coal, and paper. It is also the headquarters of the Hamburg-American steamship line. The manufactures include ships, tobacco products, liquors, flour, chocolate, rubber, chemicals, electrical goods, motor cars, and steel products. Workingmens' sections were devastated in World War II.

Hamburg was one of the principal cities of the Hanseatic League in the 13th century. In 1842, a large part of the city was destroyed by fire and was since rebuilt in a modern fashion. As a memorial of the fire, the Church of Saint Nicholas was erected, with a spire rising 482 feet above the ground. Hagenbeck's private zoological gardens contain one of the largest collections of wild animals in captivity. The city is the capital of the state of Hamburg, some 160 square miles in area, which has self-governing rights within the German republic. It is also the seat of the University of Hamburg. Population of city, 1,851,327.

Hammerfest. The most northerly incorporated town in the world, situated on an island off the northern coast of Norway 300 miles north of the Arctic circle. The inhabitants support themselves by fishing, raising reindeer, and entertaining tourists, large numbers of whom annually visit the town in order to view the spectacle of the midnight sun. The sun does not set on Hammerfest from May 13 to July 29. Population, 3470.

Hanover (**Hannover**). An industrial city of northern West Germany, about 150 miles west of Berlin. The leading manufactures are iron and steel products, musical instruments, machinery, rubber, cotton, cork, chocolate, tobacco, furniture, chemicals, and leather. Among the features of Hanover are the city forest, lying in the suburbs and containing a zoological garden; the Grosse Garten, a pleasure ground richly adorned with statuary; Herrenhausen Castle; the Marktkirche, a 14th century church with a tower 300 feet high; and a veterinary school founded by George III of England. It is now capital of the state of Lower Saxony. Hanover was formerly the capital of the Kingdom of Hanover, a state which, from 1714 until 1837, had the same rulers as England. Population, 547,767.

Havre, Le (E. *hä'vĕr*; F. *lĕ ȧv'r'*). One of the largest seaports of France, situated at the mouth of the Seine river near the center of the country's northern coast. Its exports are mainly silk and cotton goods. The manufactures include chemicals, rope, machinery, flour, dyes, textiles, toys, and refined oil.

The importance of Havre dates from 1517, when the improvement of its harbor was begun. During World War I, the city was temporarily made the seat of the Belgian government. Population, 183,776.

Heidelberg. A university town of Baden in southern West Germany. The university was founded in 1385 and numbers among its graduates Melanchthon, Gervinus, Kuno Fischer, and Bunsen. The town has an ancient castle, which contains in its cellar a cask with a capacity of 46,732 gallons. Near Heidelberg, in 1907, the lower jawbone of a prehistoric man was found, and the city has given its name to the racial type which, on the basis of this bone, is believed to have existed many hundreds of thousands of years ago. Population, 124,401.

Helsingfors (*hĕl'sĭng-fôrs'*) (**Helsinki**). The capital and largest city of Finland, located in the south part of the country on a peninsula projecting into the Gulf of Finland. The city is strongly fortified. It is regularly laid out and has many fine buildings and handsome parks adorned with monuments. The University of Helsingfors was originally founded at Abo in 1640 and was moved to Helsingfors in 1827. Helsingfors is the chief industrial city of Finland, manufacturing tobacco, liquors, and carpets. It has a considerable commerce in timber, paper, and dairy products. In 1952, the Olympic Games were held here. Population, 501,474.

Hull. A large seaport of central eastern England, situated at the mouth of the Hull River in the estuary of the Humber. It is the chief outlet for most of England's exports to Denmark, Norway, and Sweden. Its docks cover 200 acres. The city has extensive fishing interests, and its manufactures comprise iron goods, engines, ships, chemicals, soap, cement, paper, cotton goods, and leather. William Wilberforce was a native of Hull. Population, 300,320.

Istanbul, formerly **Constantinople.** The largest city of Turkey. It is built on a peninsula on the northern side of the Bosporus Strait at its outlet into the Sea of Marmara. Istanbul occupies a key position, commanding a vast commerce between the East and the West. It has an excellent natural harbor in the Golden Horn, a northwestern inlet of Bosporus Strait.

Stamboul, or the Turkish section, has a typically Asiatic character, being surrounded by walls, now partly ruined, and having unimproved, crooked streets, picturesque mosques, and extensive, colorful bazaars. There are two suburbs—Galata, the foreign business quarter, built mainly of stone; and Pera, a modern residential section of the foreign inhabitants, which is separated from Stamboul by the Golden Horn. The finest street in the city is the Grande Rue, in Pera, which is lined with fashionable shops and large hotels. Educational institutions include Stamboul university and Roberts college.

The most notable buildings of Istanbul are the mosques. Saint Sophia, originally built by Justinian as a church, and later converted by the Turks into a mosque, is being restored to its original beauty and is to be used as a museum. The Suleymanieh Mosque is the city's outstanding example of genuine Turkish architecture.

Secular buildings of historic interest include the Castle of the Seven Towers, once used as a state prison; the hippodrome completed by Constantine; and the old seraglio, now transformed into a museum, in which is stored an extremely valuable collection of Greek antiquities. Water for the city's use is conveyed long distances by aqueducts, some of which date from the 3d century A. D., and is held in reservoirs until required. One of these reservoirs is covered with a roof supported by 420 marble columns and is said to be the largest work of its kind in the world.

Large manufacturing establishments in Istanbul are few in number, producing mainly ironwares, leather articles, and tobacco goods. The handmade products, however, are important both in variety and in quantity. The chief exports of the city are carpets and rugs, lambskins and wool, attar of roses, embroidery, and filigree work.

Istanbul was often referred to formerly as the Sublime Porte. This is a French term meaning the lofty gate and referred to an elaborate entrance into the enclosure containing the government buildings. This name was used to designate the city as a political capital.

The city was founded in the 6th century B. C. by Greek colonists, who gave it the name Byzantium. In 330 A. D., Constantine the Great made it the capital of the Roman Empire, changing its name to Constantinople. Taken by the Turks in 1453, the city became the capital of the Ottoman empire and the residence of the head of the Moslem religion. In 1920, however, the Turkish Nationalists revolted, choosing as their capital Ankara, in Asia Minor. The name Constantinople was then changed officially to Istanbul. It is now Turkey's chief link with the Western world. Population, 1,750,642.

Jena (*yā'nä*). A university town within East Germany. The university, founded in 1558, has numbered among its professors Humboldt, Hegel, Fichte, Schiller, Haeckel, and Eucken. Goethe resided here at one time. The city is also noted for its production of lenses. Jena was the scene of a disastrous German defeat in the Napoleonic wars. Population, 82,113.

Karlovy Vary. Formerly known as Karlsbad, this is one of the most celebrated fashionable watering places of Europe, situated in Czechoslovakia. It is famous for its hot mineral springs, the daily flow of which is estimated at 2 million gallons. The name means Charle's Bath, Charles IV of France having bathed there.

The principal buildings of Karlovy Vary are an iron and glass structure, called the Sprudel colonnade, and an edifice in the Greek style, called the Muhlbrunnen colonnade. The city is noted also for porcelain manufacture. The resort is visited annually by upwards of 65,000 guests. The permanent population of the town is about 43,091.

Kharkov. An industrial city of southern Russia and the administrative center of the Ukraine soviet republic. Being near to the Donetz coal field and to important iron ore deposits, it has become one of the chief Russian centers of heavy industry. The manufactures include iron and steel, machinery, agricultural implements, tractors, elevators, dynamos and electric motors, rope, coal tar products, and airplanes. Kharkov has an Institute of People's Education, an agricultural and economic institute, and museums for the demonstration of improved agricultural methods. Population, 1,125,000.

Kiev (*kē'yĕf*). One of the oldest cities in Russia, attractively situated amid wooded hills on the Dnieper River in the southwestern part of the country. The Dnieper is here spanned by a suspension bridge, 3510 feet long. In the upper town is the famous Petchersk monastery. The city has numerous churches, whose gilded cupolas, seen at a distance, impart to it an almost Oriental effect. It suffered severely from civil war and famine in 1917-20, during which period it changed hands six times.

Christianity was first preached in Russia at Kiev, which has long been the chief eastern center of the Greek Catholic religion. There is a large trade in flax, wool, wine, cattle, timber, grain, and fruits. The manufactures include sugar, hardware, tobacco goods, machinery, glass, leather, and yeast. Population, 1,413,000.

Königsberg (*kû'nĭĸs-bĕrĸ*), **Kaliningrad.** A city located in western Russia near the border of Poland, lying on the river Pregel, about 4 miles from its mouth in the Frisches bay, a southern inlet of the Baltic Sea. It was

almost entirely destroyed in 1945. Its manufactures include locomotives, chemicals, cork, tobacco, sugar, malt liquors, and pianos. Amber articles constitute a distinctive product. The University of Königsberg was founded in 1544. Kant, who was born in Königsberg in 1724, was a member of the university's professional staff. Population, 238,000.

Krakow (*krā'kō*). A city of southwestern Poland, situated at the head of navigation on the Vistula River. It was annexed by Germany in 1939. Krakow was the capital of Poland from 1320 to 1609. Favored by its position as a river port and railroad terminal, Krakow has become the trade center of a large territory. The city was founded in 700 A. D. by the Polish Duke of Krak. Population, 525,000.

Lapland. An area of indefinite extent at the northern extremity of Europe. The region has no separate political existence, but includes parts of Norway, Sweden, Finland, and Russia. Reindeer provide sustenance, clothing, and transportation. The people are called Lapps. They belong to an Asiatic race and average about 5 feet in height.

Lausanne (*lō'zan'*). A city of western Switzerland, built on five hills rising from the north shore of Lake Geneva. The city is a railroad and educational center and has a large tourist trade. The manufactures include chocolate, machinery, tobacco goods, and sugar.

The Protestant Cathedral of Notre Dame is the city's most notable church. It dates from the 13th century and was intimately associated with the rise of Protestantism. The University of Lausanne, founded as an academy in 1537, was one of the first schools established for the training of Protestant ministers. The city has been the scene of many important international conferences of statesmen. The language of the citizens is French. Gibbon wrote most of his *Decline and Fall of the Roman Empire* while a resident of Lausanne. Population, 132,500.

Leeds. A woolen and steel manufacturing city of north central England. The woolen industries especially have been famous for centuries. The chief products of the city, apart from textiles and steel, include machinery, agricultural implements, leather, furniture, artificial silk, and ready-made clothing.

In the midst of the factory district stand the celebrated ruins of Kirkstall Abbey, founded in the 12th century. The city also has a fine university and is noted for a great music festival held every three years. Population, 508,000.

Leghorn (**Livorno**). A seaport and commercial city of northwestern Italy, situated on a spacious, improved harbor on the northeastern coast of the Tyrrhenian Sea. The industries include shipbuilding and the manufacture of copper and brass products, coral ornaments, glass, porcelain, chemicals, electrical apparatus, and flour. The city is noted also as a summer resort. The architectural monuments are comparatively few, the most notable being the cathedral, dating from the 17th century. There is a handsome synagogue founded in 1581. Population, 152,517.

Leicester (*lĕs'tĕr*). A manufacturing city of central England, about 100 miles northwest of London. The chief industrial products are woolen hosiery, boots and shoes, bricks, and dyes. The city lies in a rich coal mining and sheep raising district.

Leicester is a progressive municipality, providing adequately for the health, education, and recreation of its inhabitants. Saint Nicholas church was constructed partly of bricks taken from a Roman wall in the vicinity. The assize court of Leicester is held in a building which was formerly the banquet hall of a Norman castle. Population, 283,540.

Leiden. A city of the Netherlands about 10 miles east of The Hague and 6 miles inland from the North Sea. It has a famous university founded in 1575 by William of Orange. Leiden is also known as the birthplace of Rembrandt and as the city which received the persecuted English emigrants, some of whom sailed later in the *Mayflower* to Plymouth, Massachusetts. Population, 95,964.

Leipzig (E. *līp'sĭk;* G. *līp'tsĭk*). A city of East Germany, noted as the chief center of the country's publishing industry. There are about 1000 establishments engaged in the business. The city is also a world market for furs, which, along with glass, cloth, and leather, are sold in great quantities at fairs, three of which are held each year.

It was the birthplace of Richard Wagner, and Bach is buried in the church of St. John. Many old buildings were damaged or destroyed by bombs in World War II, but one interesting survival is Auerbach's cellar, represented by Goethe as the scene of part of his *Faust*. The city was captured by American forces in April 1945, but is now in the Russian zone. Near Leipzig, in 1813, was fought the battle in which Napoleon was defeated prior to his banishment to Elba. Population, 595,712.

Lemberg (**Lvov**). A city of the Ukraine, almost surrounded by strongly fortified hills. Formerly known as Lemberg, it is the seat of three archbishops and has three cathedrals—a Roman Catholic, an Armenian, and a Greek Catholic. There are many educational institutions, chief of which is a university founded in 1784, when the city was a part of Austria. Lvov was annexed by Russia in 1939.

Lvov has numerous manufactures, including ironwares, musical instruments, bricks, flour, and spirits, and conducts a large trade in linen, flax, hemp, and wool. The Fair of the Three Kings is held here each January. Population, 469,000.

Leningrad (E. *lĕn'ĭn-grăd*) (R. *lyĕ'nĭn-grăt*). One of the largest cities of Russia, situated at the head of the Gulf of Finland on the delta of the Svir River. The port and fortress of the city is Kronstadt, on a near-by island. Canals connect the city with the White and Black seas.

Leningrad, formerly called Saint Petersburg, and, after 1914, Petrograd, was the creation of Peter the Great of Russia, who built it at enormous cost of labor and of life, in order to obtain communication with Western Europe. He populated it, in part, by compelling his wealthier subjects to spend a portion of each year in the city. Its name was changed to Leningrad in 1924.

From the Admiralty, in the center of Leningrad, radiate three great avenues, one of which—Prospekt of the 25th of October—ranks among the finest streets in Europe. Near the Admiralty stands the Winter Palace. It is connected by a gallery with the Hermitage, which houses an art collection of rare value. Across the Neva river from the palace is situated the prison of Saint Peter and Saint Paul, infamous for the many political prisoners formerly confined within its walls. The city has one of the finest subways in the world.

Leningrad was formerly the capital and the greatest commercial and industrial city of Russia, being the outlet for enormous exports of wheat. The Revolution of 1917 broke out there. In 1918, the national government was removed to Moscow. After a period of industrial paralysis, during which the city's population fell from over 2,300,000 to 722,000 it recovered rapidly as an industrial center. Its chief products are metal and machinery, chemicals, textiles, rubber, leather, tobacco, paper, furniture, matches, and foodstuffs. Population, 3,296,000.

Liége (*lē-ĕzh'*) or **Luik.** The chief manufacturing city of Belgium, situated amid rich coal mines in the eastern part of the country and built on both banks of the Meuse river. The chief industrial products are guns, steam engines, machinery, motor cars, and textiles. The city has numerous educational institutions, including Liége university, the museum of which contains the skeletons of many prehistoric animals found in the vicinity.

Liége is the center of the Walloon culture, akin to the French. A chapel built in the 6th century furnished the nucleus about which the city began to grow. The German attack on the surrounding fortresses was one of the first battles in World War I. Population, 450,387.

Lille (*lēl*). An industrial city in northern France, connected by a canal with the North Sea. 30 miles distant. The chief manufactures are linen and cotton textiles. locomotives, structural steel, sugar, chemicals, tobacco, and soap. Lisle thread derives its name from the city.

The city is modern in appearance and well built. Its features include the Church of Saint Maurice, the Palais des Beaux Arts with its extremely valuable collection of paintings, and Lille university, at which Pasteur was a professor. Lille suffered severely during World War I, part of the laboring population having been deported to work in German factories. Population, 193,096.

Limerick. A port of Eire in southwestern Ireland, at the head of the Shannon estuary. Butter and condensed milk are the most important exports. The industries include flour milling, the curing of bacon, and the manufacture of lace, fishhooks, leather, and clothing. Limerick is an ancient city, known to Greek geographers as Regia. It has given its name to the type of nonsense verse known as a limerick. Population, 50,786.

Limoges (*lē'mōzh'*). An old city of France, situated somewhat southwest of the geographical center of the country. It is famous for its porcelain industry, Limoges china being known in all parts of the world. Other important industries are printing and the manufacture of liquors, leather goods, hats, and gloves. The city has a museum of ancient pottery. Every seventh year, the Fête d'Ostension is celebrated to commemorate a plague, which, in the 10th century, destroyed 40,000 people. Limoges was the ancient capital of Limousin, a former French province, which gave its name to the limousine. Population, 113,378.

Lisbon. The capital and largest city of Portugal, beautifully situated at the head of the Tagus estuary about seven miles from its mouth in the Atlantic Ocean. Its harbor has few superiors and facilitates a large commerce. The city has manufactures of cork, textiles, pottery, paper, chemicals, sugar, iron castings, and machine-shop products.

Although founded by the Phœnicians, Lisbon has a modern appearance, having been almost entirely rebuilt after the earthquake and tidal wave which, in 1755, destroyed most of the city and took nearly 40,000 lives. Between the terraced levels of the city, elevators carry people up and down. The Avenue of Liberty, 300 feet wide with a double row of shade trees down the middle, commemorates the freeing of Portugal from Spain in 1640. Other features of the city include the Botanical Garden, the Estrella Garden, the Estrella Church, a university, and numerous other educational and scientific institutions. Camoëns and Vasco da Gama were born in Lisbon. Population, 825,800.

Liverpool. The third largest city of England, situated near the center of the country's western coast on the northeastern side of the Mersey River estuary. Among British cities, its total commerce is second only to that of London, while its foreign trade exceeds London's by a considerable margin, giving it the distinction of having the largest foreign commerce of any city in the world. The harbor has been elaborately improved. By a system of locks, the water level of the inner harbor is rendered independent of the tides. Docks cover an area of 660 acres, and there are about 40 miles of quays. The storage facilities include a 13-story tobacco warehouse with 36 acres of floor space. There are also installations for storing over 100,000 tons of oil and spirits in bulk.

Liverpool is connected with Birkenhead on the opposite side of the Mersey River by a railway tunnel nearly a mile long and a vehicular tunnel which ranks with the greatest in the world. Beneath the city, also, there are five tunnels used by railroads. Liverpool university is widely known for its school of tropical medicine. One of the most noteworthy of the city's buildings is Saint George's Hall, a structure of the Corinthian order, erected with the proceeds of dock profits. The Anglican cathedral, begun in 1904, is designed to be the largest in England. Also under construction is a Catholic cathedral of Christ the King, to be surmounted by a dome 168 feet in diameter, the largest in the world. Liverpool was the first city in England to provide municipal baths, having maintained such establishments since 1794. Population, 712,040.

Lodz. The second largest city of Poland, located in the west central part of the country on a site which, in 1800, was covered with impenetrable forest. It has grown with remarkable rapidity, having become, since 1870, largely through the activity of Germans, the chief center of the textile industry in Poland. Other manufactures include chemicals, beer, machinery, and silk. Population, 745,400.

LONDON. The capital of Great Britain and Northern Ireland, the commercial, financial, artistic, and intellectual center of the kingdom, and the second largest city in the world. It is situated in southeastern England on both banks of the Thames River about 60 miles from its mouth. London consists of three parts: "the City," a space one square mile in area; the County of London; and the "Outer Ring," or metropolitan district. The whole constitutes Greater London, which covers an area of 693 square miles lying within a radius of 15 miles from Charing Cross, a central point in the heart of London.

Commerce. London handles one-third of Great Britain's commerce. The docks cover about 650 acres, and the quays have a total length of 28 miles. Each dock is an interior basin accessible by means of a lock. The port officials and their staffs are accommodated in a domed edifice completed in 1922 at a cost of ten million dollars. London's foreign commerce amounts to nearly four billion dollars annually. Products handled by the port come from all parts of the world and exhibit an extraordinary variety. Wool represents the greatest bulk.

Industry. London easily leads all other cities of Great Britain in the aggregate value of manufactures. The clothing industries engage the greatest number of workers. Other important manufactures are furniture, machinery, silks, and leather products. Printing and bookbinding employ nearly 50,000 persons. The industrial establishments are mainly confined to the eastern and southern parts of the city.

Transportation. All the trunk railway lines of England converge in London, which is, also, connected with European points by airplane service. Electric railways operate subways, or "tubes," and cross beneath the river by means of tunnels. The river is spanned by numerous bridges, of which London bridge, Tower bridge, Blackfriars, Waterloo, and Westminster are among the more noteworthy.

Streets. The thoroughfares of London are not laid out on straight lines but parallel the winding of the Thames river. The more famous streets include a popular promenade along the Thames embankment; Lombard street, the financial center of the city; Fleet street and Paternoster row, both devoted to printing and bookselling; Whitehall street and Downing street, where the government offices are located; Haymarket, a street of theaters and cafes; the Strand, an avenue of retail stores, hotels, and places of amusement; Regent street, with handsome shops; Piccadilly, lined with shops and hotels; and Bond street, also noted for its shops. Large sections of London were devastated during World War II.

Squares, Parks, and Monuments. Charing Cross, standing in the center of Greater London, is named after a memorial cross erected in 1290 by Edward I in the former village of Charing. The cross has disappeared, and its place has, since 1675, been occupied by a statue of Charles I. Popularly, the name is associated with a near-by railroad station, in the courtyard of which stands a modern reproduction of the cross.

Trafalgar square contains a lofty column in memory of Nelson and a statue of Washington, the latter a gift from the state of Virginia in 1922. Hyde park with the adjoining Kensington gardens covers 630 acres and contains a large statue of the duke of Wellington and the national monument to Queen Victoria. Whitehall has a magnificent cenotaph erected "To the Glorious Dead," a memorial to the English soldiers who fell in World War I. In Regent park is located one of the greatest zoological gardens in the world. Other pleasure grounds include Saint James park and Epping forest, the latter being a tract of 5600 acres northeast of London purchased by the city and thrown open to the citizens.

Buildings. The Tower of London, erected by William the Conqueror, stands guard over the eastern entrance of "the City." Formerly used as a prison, it serves now chiefly as a museum and contains the crown jewels of the British sovereigns. The Houses of Parliament, known as Westminster Palace, cover 8 acres on the bank of the Thames river. The building has 1100 rooms and two towers, one with an altitude of 340 feet. The other is 318 feet high and contains a clock which rings "Big Ben," a famous bell weighing 13 tons. Saint Paul's Cathedral, planned by Sir Christopher Wren, is surmounted by a dome which reaches a point 364 feet above the street. Buckingham palace is the residence of the royal family when in London.

Westminster Abbey, dating from 1220, is the coronation church of the British sovereigns. It has a length of 531 feet, a width of 203 feet, and a tower rising 225 feet above the ground. The building is the burial place of many of the country's rulers, and has monuments to famous British warriors and statesmen. The "Poets' Corner," in the south transept, contains the tombs of most of England's great writers from Chaucer to John Ruskin.

Among the other notable buildings and institutions of the city are the British Museum, which contains three million volumes and priceless treasures of ancient art and antiquities; London university, adjoining the British Museum: the Bank of England building, covering four acres of ground; the South Kensington Museum, where classes are conducted in art and in industrial sciences; the Temple, a group of buildings long known as the residences of law students; and the People's Palace, used for recreation and for education of the poorer classes. London university comprises upwards of 30 different colleges located in various parts of the city.

London has many reminders of America. A statue of Lincoln faces Westminster Abbey, and within the famous edifice is a bust of Longfellow and a window and tablet to Lowell. John Harvard, the founder of Harvard university, was baptized in Southwark's cathedral. John Quincy Adams was married in All Hallows church, where, too, William Penn was baptized. Theodore Roosevelt's second marriage was solemnized in Saint George's church, Hanover square. In Saint Margaret's church, Americans have installed a beautiful window to the memory of Phillips Brooks, Episcopal bishop of Massachusetts. Pocahontas is commemorated by a window in a small Gravesend church, where she was buried in 1617. Christ church has a Lincoln tower with the Stars and Stripes cut in the stone. In Westminster Abbey, a tablet was erected in 1923 commemorating Walter Hines Page, American ambassador to Great Britain during World War I. In 1950, a statue of Franklin D. Roosevelt was erected in St. James's Square.

Government. Greater London has no mayor, but, in most matters, is directly under the control of Parliament. "The City," however, is nominally independent even of the sovereign, who may not enter until he receives the key of admission from the lord mayor. London county consists of a large number of boroughs, each having its mayor and alderman.

History. London is first mentioned in history by the Romans, who built walls about the city. It was later burned by the British queen Boadicea, sacked by the Danes, and later was taken by William the Conqueror, who granted the city its charter. In 1666, the Great Fire destroyed four-fifths of the buildings. In 1851, the first international industrial exhibition took place in London. Population, 7,880,760.

Lourdes (*lōōrd*). A town of southwestern France, situated at the foot of the Pyrenees mountains and about 80 miles from the head of the Bay of Biscay. It is one of the chief places of Catholic pilgrimage in Europe, being visited annually by upward of 600,000 people.

The fame of Lourdes dates from 1858, when the Virgin appeared to a young girl, Bernadette Soubirous. The grotto near which the apparition took place is now surmounted by the magnificent Church of the Rosary, containing a shrine dedicated to the Virgin, "Our Lady of Lourdes." The church contains numerous crutches, tablets, and gifts, which memorialize cures credited to the Virgin. A near-by spring, which appeared at the time of the apparition, is diverted into several basins, in which the pilgrims bathe. On August 20 each year, a national pilgrimage is conducted to Lourdes.

The inhabitants of Lourdes are economically dependent on the pilgrims. The chief products are souvenirs. Population, 15,691.

Louvain. A city of central Belgium, formerly the center of a thriving textile industry. In recent times, the city has been chiefly noted for the University of Louvain, founded in 1425-26, and for several fine buildings, a number of which were burned while the city was under German occupation during World War I. A new library building, erected mainly by American generosity, was dedicated in 1928. Population, 32,524.

Lucerne (**Luzern**). A city of north central Switzerland, having a location of rare beauty at the northwestern extremity of the Lake of Lucerne. The inhabitants are occupied chiefly in providing accommodation and services for tourists, who throng the city's 70 hotels in numbers exceeding an annual total of 140,000. The most noted memorial of the town is the famous "Lion of Lucerne." It is in a nearby grotto and consists of a colossal figure of a lion transfixed by a spear but still defending the lilies of France. The figure is carved from the solid rock and was executed in memory of the 781 Swiss guards of Louis XVI, who were slain in 1792 during the attack on the Tuileries in Paris. Population, 72,400.

Lyon. A commercial and manufacturing city of France, situated southeast of the country's geographical center at the junction of the Rhône and the Saône rivers. The rivers are crossed by 24 bridges, one of which, opened in 1918, is called President Wilson bridge.

Industrially, Lyon is second only to Paris among the cities of France and is the foremost silk manufacturing city of the world. Other important products include rayon and cellophane, chemicals, machinery, macaroni, hats, chocolate, leather, jewelry, and tobacco goods.

Lyon's importance dates from the period of the Roman republic. The ruins of a Roman bath and of a Roman theater still remain. The city's oldest edifice, the Church of Saint Martin d'Ainay, utilizes several columns of a Roman temple which formerly occupied the site. The Cathedral of Saint Jean, begun in 1110, is one of the finest examples of early Gothic in France. Other notable structures are the Hôtel de Ville, the Bourse, and the Palais des Arts. The University of Lyon ranks next to that of Paris among French universities in number of students. The Roman emperors Claudius and Caracalla were born in Lugdunum, as Lyon was called by the Romans. Population, 528,535.

Lvov. See *Lemberg*.

Madrid. The capital and largest city of Spain, situated 2100 feet above sea level on a plateau near the center of the country. In this city are centered most of Spain's governmental, educational, and artistic activities. Since 1890, manufactures have increased greatly and now include leather, chemicals, pottery and porcelain, matches, cork, paper, glass, foundry products, furniture, and carpet.

Madrid centers about a plaza lined with impressive buildings. The ten most important streets radiate from this plaza. The magnificent Liberty Avenue, traversing the city in a north and south direction and ornamented with four to six rows of trees and with numerous monuments, is one of the finest promenades in the world. The Royal Palace, built of granite and white marble, stands on a hill which overlooks the city from the west. The adjoining armories contain the armor of Columbus and that of Cortés. Other features of the city are the National library, the University of Madrid, the Press Palace of skyscraper-like construction, a magnificent bull ring seating over 13,000 persons, and the National art gallery, the last containing, next to the Louvre, the world's most valuable collection of paintings. Population, 2,599,330.

Maelstrom (*māl'strŏm*). The literary and former name of Moskenstrom, a celebrated tidal eddy, occurring between two small islands at the western end of the Lofoten group off Norway's northwestern coast. The eddy is caused by the tidewaters passing through a narrow channel between the ocean and Vestfiord. The Maelstrom was memorialized by Schiller in his poem "The Diver." When the current flows fastest and the wind blows directly against it, the sea for miles around becomes so agitated that small vessels cannot survive in it. Ordinarily it may be traversed without danger The name is often used as a synonym for whirlpool.

Magdeburg (G. *mäg'dĕ-bōōrĸ*; E. *măg'dē-bûrg*). A commercial city of East Germany, situated on the Elbe River 88 miles southwest of Berlin. The chief manufactures include steel products, sugar, chemicals, tobacco goods, gloves, fertilizers, cement, glass, and rubber. The old royal palace is now used as a museum. Magdeburg was the birthplace of Otto von Guericke, the inventor of the air pump. The city sided with the Protestant powers during the Thirty Years' war and, in 1631, was sacked and burned, 30,000 of the inhabitants being put to the sword. Population, 268,048.

Malaga (S. *mä'lä-gä*; E. *măl'ă-gă*). An ancient city of southern Spain, picturesquely located on a fine harbor opening into the Mediterranean Sea. A mountain range surrounds the town on three sides. The principal architectural feature is the vast cathedral dominating the whole view of the city from the sea. Malaga is known for Malaga wine, grapes, and raisins. The site was first settled by Phœnicians. Population, 312,018.

Malmö (*mälm'û'*). A seaport of southern Sweden, situated on The Sound opposite Copenhagen. Malmö is an important railroad terminal and manufacturing center and has grown rapidly in recent years. Among its industrial products are iron castings, railroad cars, and textiles. The city has a large artificial harbor and exports much farm produce. Population, 253,502.

Manchester. A manufacturing city and third largest port of England, lying about 200 miles northwest of London and 35 miles inland from the western seaboard. It is connected with the sea by the Manchester ship canal, which was the first ship canal to be built in England.

Manchester is the largest cotton manufacturing city in the world and the center of one of the world's greatest industrial areas. Besides cotton, the manufactures include structural steel, electrical machinery, chemicals, glass, paper, rubber, and silk. The city has 1600 acres devoted to parks. Victoria University of Manchester is the city's leading educational institution.

The more important buildings include the town hall, a Gothic structure costing over $5 million; the Royal Exchange; The Royal Institution, an art gallery in the Doric style; Free Trade Hall; and Ship Canal House, the tallest commercial building, constructed on American design. Population, 625,250.

Mannheim (*măn'hīm*). A manufacturing city of West Germany, situated at the confluence of the Rhine and the Neckar River, 43 miles south of Frankfort. Mannheim is said to be the most regularly built city on the continent of Europe. It consists of 136 square sections, the whole surrounded by a semicircular boulevard, known as the Ring Strasse. Outside the semicircle are numerous suburbs. Nearly all historic buildings were destroyed in World War II.

Mannheim's commerce consists chiefly of grain, coal, petroleum, tobacco, sugar, and ironware. The manufactures include machinery, celluloid, carpets, chemicals, furniture, glass, and leather goods. Population, 329,911.

Marseille (*mär'sâ'y'*). The second largest city of France and the republic's principal seaport, located in the southeastern part of the country on an inlet of the Mediterranean Sea. Southwest of the harbor lies the islet Chateau d'If, celebrated in Dumas's *Count of Monte Cristo*.

Marseille's trade is largely with eastern countries and with the French Community in northern Africa. It consists mainly of woolen goods, ribbons, sugar, and wines. The city has large shipyards and factories for making soap, vegetable oils, and numerous other products.

The national anthem of France, "The Marseillaise," received its name in Paris when a battalion of Marseillais, or citizens of Marseille, sang the song at the storming of the Tuileries. Massilia was the name given to the city by the Romans when the settlement was already many centuries old, having been founded by Phœnicians prior to 600 B. C. It was the home of Pytheas, a Greek explorer who visited Britain in the 4th century B. C. The city's importance in modern times dates from 1848, when the surrounding region was irrigated by a canal from the Durance River about 100 miles distant. Marseille has the finest modern cathedral in France. Population, 778,071.

Milan (*mĭl'ăn; mĭ-lăn'*) (**Milano**). The second largest city of Italy. It lies in the northwestern part of the country about 40 miles from the border of Switzerland. Milan is the chief financial center of Italy and ranks high as an industrial community and as a seat of art and learning. The more important manufactures include locomotives, automobiles, electrical supplies, and rubber articles. The silk, printing, and furniture making trades of Italy are centered in the city.

The Cathedral of Milan, dating from 1386, is the third largest in Europe. Built of white marble, it is 486 feet long and 356 feet high. It contains 3000 statues, and its stained-glass windows are said to be the largest in the world. The edifice has a capacity for 40,000 people. Other features of the city are the Church of Sant' Ambrogio, dating from the 4th century A. D.; the former convent of Santa Maria delle Grazie, which contains Leonardo da Vinci's "Last Supper"; the Brera Palace, one of the finest picture galleries in Italy; the Teatro della Scala, the second largest opera house in Europe; and a celebrated archeological museum.

Milan was captured from the Gauls by the Romans in 222 B. C. It has frequently been sacked and burned, but its position at the northern entrance to Italy has insured its continued importance as a commercial city. Population, 1,228,092.

Monte Carlo. A city in the principality of Monaco, beautifully situated on a sheltered bay in the Mediterranean coast. Monte Carlo is best known for its Casino, a palatial building on a promontory in the east of the city. It is the chief fashionable gambling resort of Europe. The principal games played are roulette and *trente et quarante*, "thirty and forty." In the latter game, the minimum stake is 20 francs and the maximum is 12,000, while, for roulette, the stakes may range from 5 francs to 6000. Tickets are obtained free, and playing takes place between 11:30 A. M. and 11:30 P. M. The inhabitants of Monaco are not allowed to participate.

Adjoining the Casino is the *tir aux pigeons*, "pigeon shooting range," where expert marksmen compete in shooting pigeons released for the purpose. A prize of 20,000 francs is offered for a competition held each January. Population, 9516.

MOSCOW (*mŏs'kō*) (**Moskva**). The capital and largest city of Russia, situated somewhat north of the geographical center of the country's European territory. Built at the intersection of six important highways, the city has long been an important market for grain, hemp, oil, tea, sugar, hides, wool, timber, metal, drugs, and silk. Its leading manufactures are textiles, chemicals, metal and food products, glass, and leather.

Moscow is a city of striking contrasts, with its old wooden houses of the suburbs, the many-storied apartment buildings for workmen recently erected, the low dwellings of the former aristocracy with their pillared porticoes, huge factories, gilded domes of Oriental-like cathedrals, and magnificent palaces of old Russian or ultra-modern design.

The Kremlin. This is the old citadel of Moscow, and is the city's outstanding feature. It is a triangular enclosure surrounded by walls about 1½ miles in length. Its walls are surmounted by 18 towers and pierced by 5 gates. The main entrance opens on the Red square, and is fronted by the massive mausoleum of Lenin, within which lies his embalmed body in a glass case. Within the Kremlin stand the government offices and a number of palaces and cathedrals. In the Great Kremlin Palace, built of white stone with a gilded cupola, are held the congresses of the Communist, or Third, International.

Other points of interest in the Kremlin are the Tower of Ivan the Great, which is 322 feet high and contains 34 bells with a total weight of 290 tons; several monasteries of considerable antiquity; and the Czar Bell, cast in 1733, which is the largest bell in the world. It weighs 220 tons and measures 22 feet in diameter and 19 feet 3 inches in height. The bell was never hung, having been cracked by a fire before it left the foundry.

Reconstruction. Beginning in 1935, a reconstruction of Moscow was begun, with plans calling for its expansion from 68 to 234 square miles and accommodation for five million inhabitants. Eleven miles of a new subway had already been completed in that year.

Under this plan, the Kremlin, preserved and restored, will remain the central feature of the city. Along one side the magnificent Lenin boulevard will be constructed, flanked by many of the finest new buildings in Russia. At one end is the site of the Palace of the International Soviets, planned to be the world's tallest building. Residential and industrial sections form a circular band about the central portion and the entire city will be ringed with parks and forests. One feature of the city as it is being rebuilt is the manner in which large factories dominate districts, each factory, workers' residences, and facilities for living being planned as a unit. Cultural institutions include the Moscow Art theater, the University of Moscow, and the Lenin institute and library.

History. The earliest reference to Moscow dates from 1147. It was made the capital of Russia, and, in spite of many sieges, conflagrations, and pestilences, it remained the seat of government until 1712, when Saint Petersburg, now called Leningrad, became the capital. In 1812, the Russians burned the city in order to deprive Napoleon of a winter base. In 1918, Moscow was again made the capital of Russia. Population, 6,422,000.

Munich (*mū'nĭk*) (**München**). One of the largest cities of West Germany and the capital of the state of Bavaria, situated near the southern extremity of the country on the Isar river, a tributary of the Danube.

Largely through the effort of King Ludwig I of Bavaria, Munich became, in the 19th century, one of the best built cities of Europe and, architecturally, one of the most beautiful. It is lavishly adorned by numerous squares and pleasure gardens and by buildings constructed in the leading styles. The English Garden, a park of 500 acres adorned with small temples and towers, was designed by Count Rumford, a native of Massachusetts. Other features of the city are the former Royal Palace, the National Theater, the Art Union, numerous museums, and the Old Castle, the last dating from 1253. The art collections in Munich are among the richest on the continent. The University of Munich is one of the leading educational institutions of Germany. Many buildings were destroyed in World War II.

Apart from art and education, the great industry of Munich is the brewing of beer. Other products of the city's workmanship are bronze founding, glass staining, silversmiths' work, wood carving, and lithographing. Railway machinery, wallpaper, gloves, and artificial flowers are also made. Population, 1,231,458.

Nantes (E. *nănts*; F. *nänt*). A seaport of northwestern France, located at the head of the Loire River estuary and about 50 miles from the sea. The industries include the canning of sardines, sugar refining, shipbuilding, and the manufacture of iron products and of tobacco goods. In history, the city is known for the Edict of Nantes, by which, in 1598, Henry IV granted toleration to the Huguenots. Population, 240,028.

Naples (Napoli). The third largest city of Italy, situated near the central part of the kingdom on the Bay of Naples, which opens into the Tyrrhenian Sea. On one side of the bay rises Mt. Vesuvius, and on the other side is the picturesque height of Posilipo. The city has a safe and deep harbor. It is an important naval station and commercial emporium and possesses numerous industrial establishments. The manufactures include steel products, textiles, glass, macaroni, and chemicals. The port is a noted embarkation point for emigrants.

Naples is visited yearly by upwards of 30,000 tourists. Its features include the cathedral, built in 1272; the National museum, containing a priceless collection of antiquities, most notably those obtained from the excavated site of Pompeii and of Herculaneum; the San Carlo opera house, one of the largest in Europe; the most complete marine aquarium in the world; and the University of Naples, founded in 1224. Naples was originally a Greek colony, established about 450 B. C. under the name of Neapolis, "New City." Population, 1,228,092.

Newcastle. One of the largest coal exporting cities of Great Britain, situated in northeastern England on the Tyne river 8 miles from its mouth in the North Sea. Quays and factories line both banks of the river for a distance of 10 miles. There are also large shipbuilding yards and locomotive, engineering, and ordnance works. Other industrial products include Portland cement, chemicals, grindstones, and refined lead. The city's pre-eminence as a coal exporting center is reflected in the popular expression, "carrying coals to Newcastle," indicating superfluous activity.

Newcastle was the site of a Roman fort built to defend the eastern end of the wall that Hadrian constructed across Britain. The city was named from a castle built here in the 11th century by Robert, the son of William the Conqueror. Population, 253,780.

Nice. A city and tourist resort of southeastern France on the Mediterranean coast and at the foot of the Alps Mountains. Its industries produce perfume, liquors, soap, silk, straw hats, and rubber, metal, and tobacco goods. An 8-acre harbor accommodates an active coastal shipping trade. An equable climate, varying from a winter mean of 49°F. to a summer mean of 72°F., lends Nice an attractiveness which is further enhanced by the meeting of sea and mountain scenery in a subtropical setting. The city is famous for its carnivals, especially the battle of flowers.

Nice is about 2000 years old, having been founded by Greek colonists. The name is Greek for Victory. It was subject at various times to Saracen, German, French, Italian, and Spanish power, but was confirmed in French possession in 1860. Population, 292,958.

Nottingham. A manufacturing city of central England, 125 miles northwest of London. It is built on the slope and at the foot of a rocky eminence, which is crowned by an ancient castle, now used as a museum. Nottingham college is on a fine 220-acre campus, called Highfields. The chief manufactures include lace, hosiery, clothing, machinery, tobacco, and bicycles. Population, 310,280.

Nuremberg (Nürnberg). A city of southwestern Germany, noted especially for its manufacture of toys, electrical machinery, and lead pencils.

Because it was an important center for the manufacture of tank, airplane, and marine engines, a majority of this picturesque medieval city was destroyed in World War II, including most of the architectural monuments. Hans Sachs and the artist Dürer were born in the city. Watches were first made here, being known as "Nuremberg eggs." Air guns and geographical globes are also claimed as Nuremberg inventions. Population, 470,778.

Oberammergau (*ō'bĕr-ăm'ĕr-gou'*). A village in the extreme south of Germany, celebrated for the Passion play, which takes place there once in each ten years, the most recent performance having been given in 1970. The play represents the crucifixion and the ascension of Jesus. It takes place each Sunday during the summer on a large wooden stage open to the sky, and it usually lasts eight hours. The performance was originally undertaken in fulfillment of a vow made in 1633 by the villagers, who thereby expressed their gratitude for the cessation of an epidemic of the plague. Oberammergau is also famous for wood-carving crafts.

Odessa. A city of southwestern Russia, situated on the north shore of the Black Sea. Its commodious harbor is divided by moles into six ports. Odessa became great as the point of export for vast quantities of grain, wool, sugar, and lumber. Its industrial products include salt, glass, motion picture apparatus, and canned goods.

Odessa was founded in 1794 by Catherine the Great as a stepping-stone to Constantinople. The city is well built and is adorned by many pleasure grounds and fine buildings. The Victims of the Revolution square contains tombs of the fallen, the city having changed hands eight times in 1917-20. Population, 892,000.

Olympia. A plain in the western part of the Morea peninsula, Greece. It contains many ruins, including those of a temple of Zeus and of a stadium in which the Olympic games were originally held. In ancient times, the temple of Zeus contained a colossal statue of this god, the work of Phidias. Carved in ivory and embellished with gold, this statue was one of the seven wonders of the world.

Oporto (Porto). A city of northwestern Portugal, beautifully situated on both banks of the Douro River about 3 miles from its mouth in the Atlantic Ocean. The river is spanned by several bridges, one of which, having an arch of 560 feet, is counted among the great bridges of the world. Manufacturing is the most prominent industry. The city's products include leather, woolens, pottery, corks, hats, and tobacco. Prominent among the exports is port wine, which received its name from Oporto. Population, 324,400.

Oslo. The capital and largest city of Norway, situated at the head of Oslo fiord in the southeastern extremity of the country. The city is the trade center for southern Norway and has large shipyards and important manufactures of woolens, matches, pulp, and nails. Hydroelectric power is abundant and cheap.

Oslo is surrounded on the land side by picturesque hills. The chief edifices are the Parliament buildings, the National Theater, the University of Oslo, the Museum of Art, and a historical museum. Oslo was founded in 1048. Having been destroyed by fire, it was rebuilt in 1624 and named Christiania. The original name was restored in 1925. Population, 487,600.

Ostend (*ŏst-ĕnd'*) **(Ostende).** A fashionable summer resort of northern Belgium, on the North Sea. The city is also a well-known gateway to continental Europe for travelers from England. During World War I, Germany used Ostend as a naval base. Population, 57,230.

Oxford. A university city of England, with a population, in 1969, of 109,720. It is situated about 50 miles northwest of London. The city is the seat of Oxford university, which was founded as early as the 12th century. This university is of especial interest to the English-speaking world on account of the Rhodes scholarships tenable at Oxford and open to students from the British dominions and the United States. The Bodleian library, connected with the university, is one of the world's richest collections of early printed books and of ancient manuscripts.

The university consists of a federation of 31 colleges, each with its own government and teaching staff. Degrees are granted by the university, not by the colleges. Shown below are the names of the colleges and the dates of their founding:

University	1249	All Souls	1438
Balliol	1263	Magdalen	1458
Merton	1264	Brasenose	1509
St. Edmund Hall	1278	Corpus Christi	1517
Exeter	1314	Christ Church	1546
Oriel	1326	Trinity	1554
Queen's	1340	St. John's	1555
New	1379	Jesus	1571
Lincoln	1427	Wadham	1612
Pembroke	1624	St. Catherine's	1962
Worcester	1714	Women's Colleges	
Keble	1868	Lady Margaret Hall	1878
Hertford	1874	Somerville	1879
St. Peter's	1929	St. Hugh's	1886
Nuffield (coed)	1937	St. Anne's	1893
St. Antony's	1950	St. Hilda's	1893

Palermo. An Italian seaport, located on the northwest coast of Sicily. The exports are mainly oranges, lemons, dried fruits, oils, sulphur, and wines. Tuna fishing and shipbuilding are the chief industries. The city ranks third among the seaports of Italy. Palermo has many architectural monuments dating from the periods when Sicily was held successively by the Saracens, the Normans, and the Spaniards. The city was founded by the Phoenicians and was captured in 254 B.C. by the Romans, who called it Panormus. Population, 653,533.

PARIS. The capital of France and the third largest city in Europe, situated on both banks of the Seine River about 110 miles from its mouth in the English channel. Paris is the commercial, artistic, and intellectual center of France and is generally acknowledged to be the most beautiful city in the world.

Streets and Boulevards. The streets of Paris do not follow any unified plan. There are, however, several systems of magnificent boulevards. Boulevard is a French word originally meaning bulwark. As the old walls encircling Paris were from time to time torn down to be replaced by others embracing a larger circle, the site of the demolished walls was converted into beautiful driveways, to which the term boulevard was still applied. The boulevards of Paris consist of several concentric systems of roughly circular courses, having their common center in the Ile de la Cité, an island in the Seine river. The longest and most recent of these boulevards owes its origin to the leveling of the 22-mile wall which, until 1919, encircled the city.

Paris is traversed from north to south by an irregular thoroughfare, which, like all the longer streets and boulevards of Paris, is known by different names in different sections of its course. The more important portions of the thoroughfare are called the Boulevard de Sébastopol and the Rue Saint Michel. The latter section passes through the so-called Latin quarter, a district south of the Seine inhabited mainly by students and given its name when university lectures were delivered in Latin.

A straighter thoroughfare crosses the city from east to west on the north side of the Seine river. This thoroughfare, which passes many of the most famous squares, gardens, and buildings of Paris, is known, in different sections, under six different names. The more noteworthy sections are the Rue de Rivoli, the Avenue des Champs Elysées, and the Avenue de la Grande Armée. Other famous streets of Paris are Saint Germain, Rue Royal, and Rue du Faubourg Saint Honoré.

Squares, Parks, and Monuments. On the north bank of the Seine, near the center of the city, lie the famous gardens of the Tuileries, a 75-acre park with numerous statues. It adjoins the Place de la Concorde, adorned by sculptured fountains and by a huge obelisk brought by Napoleon from Luxor, Egypt. The adjacent Champs Elysées. "Elysian Fields," contain the Grand Palais, built in 1718. Farther west lies the Place de Charles de Gaulle, formerly the Place de l'Etoile, which contains the world's largest triumphal arch. From this square radiate 12 avenues, including the Rue Foch, which leads to the beautiful 2100-acre park in the suburbs called the Bois de Boulogne. A southeastern suburb contains the Bois de Vincennes, an ornamental park with an area of 2300 acres.

Other notable squares and parks of Paris are the Luxembourg gardens, laid out in the 17th century; the Jardin des Plantes, 58 acres in area, where the principal scientific museums of the city are located; the Place de Rivoli, with an equestrian statue of Joan of Arc; the Place de la République; the Place d'Iena, containing a large statue of George Washington; the Place de la Bastille, near the site of the historic prison of the same name; the Place Vendôme, which has a brazen column made by melting 1200 cannon captured by Napoleon; the Square des Innocents, where stands the famous sculptured Fontaine des Innocents; the Place des Etats-Unis, in which stands a bronze monument erected in 1923 to the memory of American volunteers who fought in French armies during World War I; and the Champ de Mars, in which the Eiffel Tower rises to a height of 984 feet. It is named for Alexandre Eiffel, the engineer who constructed it as a feature of the Paris International exposition in 1889. One of France's most beautiful war memorials is a white marble temple in the Parc de Villeneuve-l'Etang, commemorating 67 American aviators who died in French service during World War I.

Buildings. The Ile de la Cité in the Seine contains three remarkable buildings: the Hôtel Dieu, which, founded in A. D. 600, is said to be one of the oldest hospitals in Europe; the Palais de Justice, architecturally one of the finest structures in Paris; and the Cathedral of Notre Dame, the

construction of which was begun in 1163. A few of the other great edifices of Paris are the Louvre, which houses the richest collection of art in the world; the palace of the Luxembourg, which contains the world's greatest collection of contemporary art, the American exhibits ranking second in number after the French; the Grand Opéra, one of the most beautiful theaters in the world; the government buildings, fronting the Seine embankment and known as the Quai d'Orsay; the Palais de l'Elysée, where the president of France resides; the Bibliothèque Nationale, one of the world's greatest libraries; the Pantheon, where many of France's most notable citizens have been buried; the Church of the Madeleine, built by Napoleon in the Greek style as a "temple of glory;" and the Hôtel des Invalides, which contains Napoleon's tomb. The railway car in which the armistice was signed on November 11, 1918, was housed in the Hôtel des Invalides until 1927, when it was transferred to a special shelter in Compiégne woods.

Other Features. Paris was spared the fate of many European cities during World War II, suffering scarcely any damage. No other city of the world makes a feature of its sewers. Those of Paris, 9 to 20 feet in diameter and nearly 700 miles in length, are kept so clean and are so well ventilated that there is a regular tourist route through the system by boat and electric car. The University of Paris, which includes the Sorbonne, is one of the oldest and most famous educational institutions in Europe.

Commerce and Industry. Paris is the largest industrial and commercial center in France, and has a world-wide reputation for the manufacture of articles of taste and elegance, such as gold and silver ornaments, furniture, scientific instruments, toys, and perfumes. These industries, as well as the clothing industry of Paris, which largely sets the standard for the Western world in women's apparel, are carried on mainly in small establishments. The manufacture of machinery, railroad supplies, chemicals, beer, porcelain, and leather is centralized in larger factories.

Paris was one of the first cities of the world to establish large departmental stores, the better known ones being Galeries Lafayette and the Bon Marché. The banks of the Seine are lined with docks over which passes a volume of trade exceeding annually one billion dollars in value. There are more than 65 public markets in the city, the largest of which is the Halles Centrales, soon to be replaced by a modern complex and subway. The stock exchange of Paris is called the Bourse.

History. Paris was known to Julius Cæsar, about 50 B. C., as Lutetia. It was then the chief city of the tribe of the Parisii, from whom the city, in the 4th century A. D., adopted the name Paris. In the 10th century, it became the capital of the French monarchy. Paris suffered from an English conquest during the Hundred Years' war and endured several disastrous sieges, the last at the hands of the Germans in 1871. Henry of Navarre, Louis XIV, Napoleon Bonaparte, and Napoleon III contributed most toward the improvement and adornment of the city, thereby making Paris not only a symbol for light-hearted enjoyment, but entitling it also to the claim of being the chief focus of European civilization. Population, 2,790,091.

Pisa (*pē'sä*; *pē'zä*). A town of northern Italy, 11 miles northeast of Leghorn. Pisa is noted for a leaning tower, 179 feet in height, which inclines 16½ feet from the perpendicular. The tower is built entirely of white marble with walls 13 feet thick at the base. Its construction was begun in 1174, and it was originally intended as a bell tower for the white marble cathedral near by. Within the past century, the inclination of the tower has increased one foot.

Pisa was formerly notable for the victory which its citizens won over the invading Saracens in the 11th century. In the 13th century, it controlled an extensive territory and had a population of 150,000. In recent centuries it has declined in importance, but its walls and its citadel still stand. The only large industry is the manufacture of cotton textiles. Pisa was the birthplace of Galileo, who used the tower in experiments to determine the velocity of falling bodies. Population, 76,846.

Plymouth. A naval station and seaport of southwestern England. Situated on a commodious harbor, Plymouth has a large commerce. Apart from naval equipment, the chief manufactures are chemicals. Sir Francis Drake set out from Plymouth for his voyage around the world. The town has a *Mayflower* commemoration stone, which records the fact that Plymouth was the last point touched by the Pilgrim Fathers on their way to America. Facing the waterfront is the Hoe, one of the finest pleasure grounds in Europe. Population, 213,800.

Portsmouth (*pōrts'mŭth*). A seaport and the chief naval arsenal of Great Britain, situated on Portsea, a small island separated by a creek from the south coast of England. Portsmouth has the most complete fortifications in Britain. Its harbor lies close to Spithead, a capacious naval anchorage in the shelter of the Isle of Wight. The government dockyard covers about 500 acres.

The principal industries of the city are connected with the naval establishment. There is considerable traffic in timber, coal, cattle, and agricultural produce. Portchester castle, a ruined Norman fortress to the north of the harbor, occupies the site of the Roman Portus Magnus, "Great Port." Charles Dickens and George Meredith were natives of the city. Population, 221,470.

Prague (*präg*) **(Praha).** The capital and largest city of Czechoslovakia, situated on both banks of the Moldau River, a tributary of the Elbe. It belonged to Germany from 1938 to 1945. Its manufacturing establishments, located mostly in the suburbs, produce railway cars, machinery, flour, chemicals, leather goods, sugar, and furniture. Prague is the focus for the rail and river trade of southern Germany.

The most impressive edifice of Prague is the ancient palace of Hradcany, adjoining which is the Cathedral of Saint Vitus, where the Bohemian kings used to be crowned. The University of Prague, founded in 1348, had, as one of its earliest graduates, John Huss, famous as a martyr to Protestantism. Prominent features of the city are the Charles bridge, 546 yards long, spanning the Moldau and ornamented with two medieval towers and with many statues of saints; the 14th century Tyn church; and a famous clock, one of the oldest in Europe, having, for figures, representations of Jesus and his apostles. Population, 1,022,621.

Ravenna. An ancient city of northern Italy, lying 45 miles east of Bologna and 6 miles inland from the northwestern extremity of the Adriatic Sea. In the 1st century B. C., Ravenna was a naval base and seaport. Subsequent changes in the coast line, which left Ravenna an inland city, diminished its importance. A canal gives it access to the sea. Wine, silk, sugar, and lace are its chief products.

Reminiscences of Ravenna's former greatness are the Church of Sant' Orso, which, although largely rebuilt since, dates back to Roman times; twelve basilicas used as churches and erected between the 5th and the 8th century; a two-storied mausoleum of Theodoric, the Ostrogothic king who subjected Ravenna to a 3-year siege; and the tomb of Dante. Population, 56,815.

Reims (E. *rēmz*; F. *răns*). A cathedral city of northeastern France, lying about 80 miles east of Paris. The Cathedral of Reims, in which the French kings used to be crowned, was built between 1212 and 1430 and is considered to be the finest example of Gothic architecture in the world. During World War I, the structure suffered much damage, which has been largely repaired. Reims is also noted for its wines. Population, 133,142.

Reykjavik (*rā'kyä-vēk'*). The capital and largest city of Iceland, located on the island's southwest coast. The city has a university and a cathedral; also a museum containing a collection of Icelandic antiquities. Population, 90,792.

Riga. A city of Russia situated on the Duna River about 10 miles above its mouth at the head of the Gulf of Riga in the Baltic Sea. It was capital of Latvia when the latter was an independent country from 1919 to 1940. By means of canals connecting the Duna with the Volga and Dnieper rivers, Riga has access to Russia's vast regions producing timber, grain, and flax.

The principal manufactures are paper and wood pulp, matches, paints, textiles, shoes, rubber goods, cement, and tobacco. Saint Peter's church is notable for its lofty spire, which rises 440 feet above the street. Riga was founded in 1201 and became important as a member of the Hanseatic League. Nearly half the inhabitants are German. Population, 680,000.

Riviera (*rê-vyä'rä*). A popular name for the narrow but beautiful coast line of Italy and France, mainly about the Gulf of Genoa. Its mild climate, charming subtropical vegetation, and vistas of rare attractiveness make it one of the most popular parts of Europe for winter tourists. The chief resorts along the Riviera are Cannes, Nice, Mentone, Monte Carlo, and San Remo.

ROME (Roma). The capital and largest city of Italy, and, historically, the most famous city in the world. Rome is situated on both banks of the Tiber River about 15 miles above its mouth in the Tyrrhenian Sea near the center of Italy's western coast. The traditional date of the founding of Rome is April 21, 753 B. C. April 21 is still celebrated annually in Rome as the anniversary of the city's origin. Rome was successively the head of the Roman Republic, the Roman Empire, and the western branch of the Catholic Church. In 1871, it became the capital of the Kingdom of Italy. This long career of uninterrupted greatness has earned for Rome the title of "the eternal city." In 1929, a tract of 109 acres within the city was granted the status of an independent state under papal rule. It is known as Vatican City. This area is in the northwestern section of Rome and includes the former site of Nero's gardens.

THE MODERN CITY. The Tiber, meandering through the city, divides the more populous eastern part from the western section. The eastern part comprises the Campus Martius, "Field of Mars," and the seven hills of ancient Rome—the Capitoline, Palatine, Aventine, Quirinal, Viminal, Esquiline, and Cælian. The western section consists of the hill anciently known as the Janiculum and of the eminence on which the Vatican is situated. The river is spanned by ten bridges, three being of ancient construction. Rome is 15 miles in circumference and is surrounded by a brick wall 55 feet high, constructed mainly by Aurelian about 275 A. D. The wall is pierced by 12 gates. The Porta del Popolo in the north opens upon a road anciently called the Flaminian way, while the famous Appian way leaves the city through a southern gate.

STREETS AND MONUMENTS. The streets are irregular in plan. From the Plaza del Popolo in the north of the city three important thoroughfares diverge—the Corso, the Ripetta, and the Babuino. The Corso terminates at the Piazza di Venezia at the Capitoline hill, which has a colossal monument to Victor Emmanuel II. The Piazza del Campidoglio is adorned by a large statue of Marcus Aurelius, the Roman emperor who erected the so-called Antonine column, which stands in the Piazza Colonna on the Corso. An obelisk, 104 feet high, brought from Heliopolis, Egypt, has been placed in the Piazza di San Giovanni. Garibaldi, the liberator of modern Italy, is memorialized by a huge equestrian statue on the Janiculum hill. An equestrian statue of Victor Emmanuel II in a magnificent setting towers above the Piazza Venetia. Most conspicuous of all is a 180-foot bronze statue of Mussolini. The Fontana Trevi is among the grandest of the city's many sculptured fountains.

MODERN BUILDINGS. The most famous structures associated with modern Rome are those within Vatican City, notably the Vatican and Saint Peter's Church. The Vatican, or papal residence, consists of a group of palaces, covering 13½ acres and containing about 1100 rooms. It houses a library, museum, and picture gallery, each of inestimable value. The decorations of the Vatican were executed by the best artists of the Renaissance, including Raphael and Michelangelo. Saint Peter's Church is generally admitted to be the world's largest and grandest church. Its construction occupied 126 years. The building is 727 feet in length and is surmounted by a huge dome, which rises to a height of 405 feet above the level of the beautiful colonnaded court before the church's entrance.

Other notable buildings of modern Rome include the Quirinal palace, where the Italian sovereigns reside; the Villa Medici, housing the French Academy of Art; the Santa Pudenziana, the oldest church in Rome; and the palaces called Doria, Ruspoli, Corsini, Orsini, Giustiniani, Altieri, Cicciaporci, Farnese, Berberini, and Colonna. On the Capitoline hill are three palaces appropriated for the assemblies of the magistrates, for the observatory, and for the fine arts collection. There are several palaces, which, being surrounded by extensive gardens, are called villas. The most notable of these is the Villa Borghese, the gardens of which form the most fashionable promenade in the city.

EDUCATIONAL INSTITUTIONS. Rome is the seat of the University of Rome, founded in 1244. In addition to the Vatican library and the 10 public libraries, there are the libraries called Nazionale Centrale, Casanatense, and Angelica, and the libraries of the Barberini and of the Corsini palace. No city of the world has richer collections of Roman antiquities and of Renaissance art. The United States and several European countries maintain archeological schools in the city.

ANCIENT BUILDINGS The level of the ancient city of Rome is, except where excavated, from 20 to 60 feet below the level of the present city. Within the past century, a considerable portion of the ruins have been uncovered. These ruins include temples, palaces, public halls, theaters, baths, porticoes, and monuments and indicate that, in the first centuries of the Christian era, Rome was a still more impressive city than it is today.

The best preserved ancient building is the Pantheon, now used as a church, which has a dome larger than that of Saint Peter's Church. The Colosseum had a seating capacity of 45,000. The outer wall alone is said to have cost the equivalent of 50 million dollars to construct. The Forum has been despoiled of most of the palatial buildings, the 1200 marble columns, and the 1000 colossal statues which once adorned its 25 acres of surface. Other impressive ruins are the Mausoleum of Hadrian, used for 15 centuries as the fortress of medieval Rome; the triumphal arches of Titus, Severus, and Constantine; and the baths of Caracalla and of Diocletian, those of the latter having originally covered nearly 9 acres. The outlines of the Circus Maximus are still traceable—a building capable of seating 260,000 spectators.

One of the stateliest buildings of ancient Rome was the residence of the emperors on the Palatine hill. It was called the Palatium, a name from which the word palace is derived. The great drains of ancient Rome are still in use today. Dating from early Christian times are the catacombs, underground passages used as places of burial and of refuge by the persecuted Christians. About 75 groups have been found, having a total length of about 750 miles.

INDUSTRIES. Rome, noted for its fine silks and knit goods, has become a leading center for both men's and women's fashions, with many outstanding designers. Other manufactures are gloves, jewelry, mosaics, cameos, and artificial flowers. The city is also the chief railroad center of Italy and, since World War II, has experienced a vigorous economic growth. Population, 2,484,737.

Rotterdam. The chief commercial port of the Netherlands, situated in the western part of the country, about 10 miles southeast of The Hague. It is on the Meuse River 15 miles above its mouth in the North Sea. The leading articles of commerce are coffee, tea, tobacco, flour, sugar, spices, coal, oil, and foodstuffs. The most important manufactures are ships, refined sugar, margarine, paint, ropes, and leather.

A labyrinth of tree-bordered canals runs through the city, and most houses are built on piles on account of the city's low site. Rotterdam was the birthplace of Erasmus. The central part of the city was completely destroyed by German bombs in 1940. The city was reconstructed according to the most advanced principles of city planning. The port also was reconstructed and soon became one of the world's busiest, being a gateway to the "common market" of Europe, as symbolized by its landmark "Euromast"—a high tower in the form of a mast and forecastle, which houses a restaurant. Population, 727,207.

Rouen (*rwän*). A commercial and manufacturing city of northern France on the Seine River, about 70 miles northwest of Paris. Ocean-going ships ascend the river to Rouen. The industrial products include textiles, machinery, and refined oil. The Cathedral of Rouen has a spire 487 feet in altitude, said to be the highest in France. The Place du Vieux Marché is adorned by a statue of Joan of Arc, who, in 1431, was burned there at the stake. Population, 118,775.

Ruhr (*rōōr*), **The.** An irregularly oval strip of land in the northern part of West Germany, extending eastward from the Rhine for about 40 miles along both sides of the Ruhr River. The district includes the great industrial centers of Essen, Dortmund, Bochum, Gelsenkirchen, Mülheim, Oberhausen and Duisburg. It is the largest single industrial area in Europe and the most thickly populated. The reason for this great concentration of industry in the Ruhr is to be found in the rich coal mines, and the excellent transportation facilities by rail and water. The center of Germany's mining, steel, power, and chemical industries, it suffered serious damage during World War II, and afterwards many of the heavy industrial plants were dismantled. Light industries, however, sprang up, such as coal-tar derivatives, pharmaceuticals, textiles, ceramics. In 1949 France, England, the United States, and the Benelux countries established an international authority over the Ruhr, in which later the West German republic participated. German trustees supervised production, which soon approached the pre-war output.

Saint Gallen (*sänt gäl'ĕn*). A city of northeastern Switzerland, situated 12 miles from the south shore of the Lake of Constance. The city is the highest in Europe, having an elevation of 2196 feet above the sea. Its ancient Benedictine monastery, an architectural masterpiece which is now used for government offices, was founded by the Irish missionary Saint Gall, who settled here in 614. Population, 78,300.

Saint-Mihiel (*săn' mē'yĕl'*). A town of northeastern France, situated on the Meuse River 23 miles southeast of Verdun. The capture of Saint-Mihiel and the annihilation of the German salient about the town in September 1918 constituted the first military operation carried out independently by the American army in France during World War I. Population, 5,203.

Salzburg. A resort city in western Austria, beautifully situated on the Salzach River. It is one of the most attractive cities of central Europe and the scene of the famous music and theatrical festival held in honor of Mozart, who was born here. There are a Renaissance cathedral, two archiepiscopal palaces, and a castle, which overlooks the city. Salzburg is a manufacturing center for musical instruments. Population, 117,400.

Salonika (E. *săl'lô-nē'kä*); **(Thessalonikē).** A city of northern Greece, the second largest in the country, situated at the head of Salonika Bay, a northern inlet of the Ægean Sea. Salonika, having a capacious, improved harbor, is the sea outlet for Bulgarian and Yugoslavian products. Among the squalid houses which fill most of the city arise lofty spires and minarets, and numerous ruins dating from Greek, Roman, and Byzantine times.

Salonika was founded in 315 B. C. and has been held successively by Macedonia, Rome, the Byzantine Empire, Turkey, and Greece. It was the seat of an early church, to which Saint Paul addressed two epistles. Population, 378,444.

Sarajevo (*sär'ä-yä-vô*). A city of Yugoslavia, 122 miles southwest of Belgrade. It is partially Oriental in appearance, having an extensive bazaar, but, in recent decades, many modern improvements have been introduced. The chief industries are the manufacture of metal ware, silk weaving, and the making of pottery. At Sarajevo in 1914 occurred the incident which precipitated World War I, and thereby brought independence to Yugoslavia. This was the assassination of Franz Ferdinand, heir to the throne of Austria-Hungary, by F. Princip. A statue of Princip was erected in 1930. Population, 143,117.

Seville (*sĕv'ĭl*; *sē-vĭl'*) (**Sevilla**). A city and port of south western Spain, situated on the Guadalquivir River, about 50 miles above its mouth in the Atlantic Ocean. Seville was an important center of the Moorish civilization in Spain. The Alcazar, now partly in ruins, was a Moorish royal palace. The Cathedral of Seville, one of the largest Gothic churches in the world, retained, as a belfry, the Giralda tower, erected by the Moors. Other notable structures include the Moorish Renaissance palace of the duke of Medinaceli; the Museum of Painting, which houses the largest collection of the masterpieces of Murillo, a native of Seville; the buildings of the University of Seville, founded in 1502; a tobacco factory covering 6 acres; and a bull ring with a seating capacity of 12,000.

Seville was a prosperous seaport in Roman times. It had a monopoly of trade with America for a considerable period. The chief articles of trade at the present time are metals, fruits, cork, grain, and glazed tiles, the last being manufactured in a suburb, Triana. Population, 474,082.

Sheffield. An industrial city of north central England about 30 miles east of Manchester. It is noted for its manufacture of cutlery, armor plate, artillery, scientific instruments, and other steel products. The famous silver Sheffield plate is no longer made, the process being a lost art, but a high quality of silverware is made by a new process. Other industrial products include leather, bicycles, paper, brass goods, brushes, chemicals, and paints. Sheffield university was founded in 1905. The city was a target for German bombs in 1940. Population, 486,490.

Sofia (*sō'fē-yä*; *sō-fē'ä*) (**Sofiya**). The capital and largest city of Bulgaria, situated at an altitude of 1800 feet in the western part of the country. Sofia is the commercial and industrial center of Bulgaria and is connected by rail with Vienna, Salonika, and Istanbul. It has an important export trade in agricultural products and attar of roses. The city has been largely rebuilt since 1878. Its principal features include famous baths with hot springs; the ruined Sofia Mosque; and the University of Sofia, founded in 1888. Population, 810,300.

Southampton. A city and port of southern England, 79 miles southwest of London. It was a royal borough before 1086, its fine natural harbor making it at one time a rival of London. After a decline of trade in the 16th century, it was improved in the 1800's and, in 1914, was the chief port of embarkation for British armies. In 1940 it suffered severe damage from repeated German air raids. From this port, in 1620, the *Mayflower* began its voyage for America. Population, 208,710.

Spa (*spä*; *spô*). A famous watering place and town in central eastern Belgium. Its mineral springs are said to be the oldest in Europe, having been discovered in 1326. The town has been a fashionable resort for centuries. The principal buildings are the Casino and the Pouhon. Population, 9,055.

Stettin (*shtĕ-tēn'*) (**Szczecin**). A seaport and manufacturing city of northwestern Poland, built on both banks of the Oder river, 17 miles from its mouth in an inlet of the Baltic Sea. The largest industries are shipbuilding and the manufacture of clothing. Other products are cement, locomotives, sewing machines, and glass. The chief exports are grain, spirits, lumber, sugar, and cement. Population, 299,200.

Stockholm. The capital and largest city of Sweden, situated on a group of hilly islands and peninsulas at Lake Mälar's outlet into the Baltic Sea. Surrounding forests advance almost to the city's confines. On account of the varied levels prevailing in different parts of the city, tunnels and elevators are utilized by the citizens in passing from one part to another. Stockholm's capacious harbor facilitates a large commerce. The chief manufactures are ships, iron and steel products, leather, textiles, and pottery.

The features of the city include the Royal Palace; Saint Nicholas Church, where the Swedish sovereigns are crowned; the city hall, one of the finest modern structures in Europe; Skansen, a 70-acre park illustrating the fauna, flora, and peasant customs of various parts of Sweden; an equestrian statue of Gustavus Adolphus; and a colossal bronze figure of Linnæus. Population, 777,115.

Stoke. A manufacturing city of central England, about 30 miles south of Manchester, noted chiefly for its porcelain and pottery industry. Other industrial products are iron, machinery, electrical and rubber goods, and bricks. The chief public buildings are the town hall, New Market hall and Minton Memorial building. Population, 263,910.

Stonehenge. The most famous prehistoric monument in Great Britain. It is in Wiltshire county, England, about 32 miles inland from the center of the southern coast. It consisted originally of upright stones in two concentric circles surrounding two elliptical groups. The height above ground of the largest stone is 22 feet. The outer, or Sarsen, circle is 97 feet in diameter and consisted of 30 stones, 16 of which are standing, some weighing as much as 40 tons. They were joined by superimposed lintel stones attached by mortise and tenon, of which 6 are in their original position. The inner circle, 76 feet in diameter, had 60 stones, of which 20 remain and 8 are standing. The origin of most of the stones has been identified at two sites, 23 and 240 miles distant. From the center of the circles at a distance of 256 feet is set a stone whose tip is aligned with the rising sun at the summer solstice.

Stonehenge was built over a period from 1800 to 1400 B. C., probably in part by the so-called Beaker people, who distributed the first bronze beakers from Spain and are believed to have erected the thousands of stone menhirs in Brittany, similarly aligned with the sunrise at the summer solstice. It is surmised that an architect of Stonehenge came from Mycenae, Greece, since traces have been observed on a stone of an incised dagger ornament found elsewhere only in Mycenae around 1400 B. C.

Stratford. A town of south central England on the river Avon, chiefly noted as the birthplace and burial place of William Shakespeare. Located here is the Royal Shakespeare Theatre, endowed by popular subscription from people in many countries. In the vicinity are the cottages where Mary Arden, Shakespeare's mother, and Anne Hathaway, his wife, were born. Population, 17,400.

Stuttgart. A well built and beautiful city of southwestern Germany. Stuttgart is the capital of the German state of Württemberg. The city's finest structures center about a large square, called the Schlossplatz. There are exceptionally valuable collections of paintings and of antiquities in the city.

Stuttgart is the chief printing and book publishing city of South Germany. The industrial products include automobiles, furniture, machinery, paper, leather, chemicals, tobacco goods, and textiles. Population, 630,494.

Turin (*tū'rĭn*; *tû-rĭn'*) (**Torino**). A commercial and manufacturing city of northwestern Italy, situated on the Po River within view of the Alps. It is about 70 miles inland from the Gulf of Genoa and 40 miles from the French border. Turin is the center of the automobile industry in Italy. Other manufactures are machinery, cotton, silk, rayon, leather, and chemicals. Hydroelectric power for the industries is generated from near-by mountain torrents.

Turin is the only large Italian city having streets laid out on a rectangular plan. Among the features of the city are the Piazza Castello, the chief square of Turin; the palace and park once occupied by the rulers of Piedmont; the Palazzo Carignano, in which the Italian Parliament met from 1860 to 1864; and an imposing monument of Cavour, one of the liberators of Italy. The University of Turin was founded in 1405. Population, 1,111,659.

Valencia (*vä-lĕn'shĭ-ä*; *-shä*). A Mediterranean seaport of Spain near the center of the country's eastern coast. The older part of the city has narrow, winding streets, while the new portion is laid out with wide thoroughfares and well shaded squares. Its features include the cathedral La Seo, with a splendid octagonal tower; the University of Valencia, founded in 1411; the Silk Exchange, a beautiful Gothic structure; the Plaza de Toros, a richly ornamented bull ring, said to be the best in Spain.

The commerce of Valencia consists principally of rice, fruits, silk, wine, and olive oil. The manufactures include tobacco, metal and leather products, glazed tiles, and textiles of silk and of linen. Population, 501,795.

Venice (**Venezia**). A seaport of northeastern Italy, situated on 120 small islands at the head of the Adriatic Sea. Some 177 canals serve as streets, spanned by 400 bridges. Houses are built on piles. The Grand canal divides the city into two equal parts. A bridge, about 2½ miles long, connects Venice with the mainland and, passing as a viaduct over the city, slopes downward to a large open square.

Venice's greatest building, the Cathedral of Saint Mark, dating from 1047 A. D., resembles the Church, now the Mosque, of Saint Sophia in Istanbul. It is surmounted by five Oriental domes and contains four gilded, bronze horses, taken originally from Nero's triumphal arch in Rome. The bell tower of the church, standing separate from the main structure, is 322 feet high. Its construction was begun in 874 A. D. The tower collapsed in 1902 but has since been restored. The Doge's Palace, the building of which occupied the two centuries following 1301, is one of the most picturesque buildings in the world.

Among the many other features of this unique and beautiful city are the Royal Palace; a curious clock tower, built in 1496, upon which two colossal bronze figures strike

the hours on a large bell; the Bridge of Sighs, connecting the Doge's Palace with a prison; the Rialto, a marble bridge, on which are situated many busy shops; numerous churches and art galleries containing rich collections of paintings by Italian masters, including many by Titian, a native of Venice; and the museum of the city's arsenal, which exhibits a model of the *Bucentaur*. This was the ship from which, each year, the doge of Venice cast a ring into the Adriatic, thereby representing symbolically the marriage of Venice with the sea.

Venice manufactures heavy machinery, clocks, cotton and woolen goods, glassware, lace, brocades, tapestry, wood carvings, and jewelry. The city is a first-class naval station and has an excellent harbor.

Venice is said to have been founded in 452 A. D. by refugees in flight before Attila the Hun. It became prosperous by trading with the East and with the crusaders. The city's importance declined with the fall of Istanbul, but was revived when the Suez canal opened up a Mediterranean route to Asia. Population, 361,980.

Verdun (*vĕr′dŭN′*). A strongly fortified town of northeastern France, about 140 miles east of Paris. It was the objective of desperate German attacks in 1916 and 1917, which, for bitterness and carnage, were unequaled by any other conflict of World War I. The French army retained its hold on the town. Population, 21,406.

Verona (*vĕ-rō′nȧ*). A fortified city of northern Italy, lying 71 miles west of Venice. It has an important trade with Switzerland, Austria, and Germany in wines, fruits, rice, and marble. The chief manufactures are cotton, paper, flour, and nails.

Verona was a Gallic town before it passed into the hands of the Romans in 89 B. C. From the Roman period dates the amphitheater, still in use, which the emperor Diocletian built. It is about 500 feet long and 160 feet high with accommodation for 20,000 people. Numerous weather-stained palaces of white marble, mostly built in the period of the Renaissance, give to certain parts of the city an air of sumptuous decay. Population, 175,581.

Versailles (F. *vĕr′sȧ′y′*; E. *vĕr-sālz′*). A city of north central France, situated about 12 miles southwest of Paris. Versailles is chiefly noted for its palace and park of unparalleled magnificence.

The palace dates mainly from 1661, being mostly the work of Louis XIV. It consists of a central block, surrounding three sides of a large court, and of two immense wings, each enclosing two or more courts. The total length of the building with its dependencies is nearly one-half mile. It houses a picture gallery upon which alone Louis XIV spent 5 million dollars. The play of colored lights in the evening upon the waters of the sculptured fountains within the gardens constitutes a spectacle of rare beauty. An apartment of the palace, called the Hall of Mirrors, was the scene, in 1871, of the coronation of William I as emperor of Germany. In the same hall, in 1919, the representatives of Germany subscribed to the Treaty of Versailles. Population of city, 84,860.

Vesuvius (Vesuvio). An active volcano of Italy, 3891 feet high, near the Bay of Naples and about 10 miles from the city of that name. Prior to 79 A. D., it was not known that the mountain was volcanic. In that year, however, the top of the mountain blew off and ashes, stones, and mud were ejected, burying the Roman cities of Pompeii and Herculaneum in 20 feet of dêbris. The elder Pliny perished in this eruption, of which the younger Pliny left a detailed description. Other notable eruptions occurred in the years 203, 472, 512, 685, 983, 1631, 1822, 1855, 1865, 1872, 1878, 1880, 1895, 1906, 1929, 1944.

Vichy (*vē′shē*). Health resort and formerly temporary capital of France. Situated 72 miles northwest of Lyon and about 180 miles south of Paris. It owes its location to a group of about 40 springs of warm water having medicinal properties. Heavily charged with sodium bicarbonate and minerals, the water from some of the springs has a temperature as high as 120°F. About 2½ million gallons are bottled and exported annually. The 11 largest springs are state owned and supply public hospitals for treatment of soldiers and of civilians unable to pay for private treatments. The Romans built baths at Vichy, but the modern development, dating from the 17th century, owes much to Napoleon Bonaparte and Napoleon III. When the Germans in 1940 overran France and occupied Paris, the new chief of state, Marshal Pétain, then 84 years old, chose Vichy as the seat of his government. Population, 30,610.

VIENNA (Wien). The capital and largest city of Austria, built on the south bank of the Danube River. Vienna was the capital of the former empire of Austria-Hungary and, from 1938 to 1945, was a part of Germany. Since the 13th century, Vienna has been the chief artistic and cultural center of east central Europe.

Boulevards and Parks. The most notable driveway of Vienna is the Ringstrasse, which follows the line of old fortifications, demolished in 1858. It separates the old, inner city from the more modern portions. The Prater, a 2000-acre park, is the largest of the many ornamented open spaces which, in the aggregate, cover more than 50 per cent of Vienna's surface.

Buildings. The Cathedral of Saint Stephen is the most famous structure in Austria. It was founded in 1144 and has great catacombs beneath it. The cross on its steeple attains a height of 441 feet. Other great buildings are the Imperial opera house, one of the most superb art temples of Europe; the stately Grecian Houses of Parliament; the lavishly decorated Gothic city hall; the Imperial Palace; and the Votivkirche. Most of the inhabitants live in apartment houses, some of which are built on a magnificent scale, adorned with painting and sculpture.

Institutions of Art and Education. The University of Vienna, founded in 1365, enjoys a world-wide reputation. The most notable of the many public and private museums of Vienna is the Imperial Art-History museum, which contains an extraordinarily rich collection of ancient and medieval antiquities and numerous masterpieces of art, embracing nearly every school in the world.

Industries. The manufactures of Vienna include jewelry, ornaments of gold and silver, musical and optical instruments, leather goods, furniture, machinery, textiles, and chemicals. A large commerce in corn, flour, cattle, wine, and sugar is facilitated by a network of railways centering in the city and by the navigable Danube river.

History. Under the name of Vindobona, Vienna was a city of strategical importance to the Romans. It was taken successively by the Huns, the Avars, and the Franks; attained to prosperity in supplying the needs of the crusaders; and, in 1296, became the residence of the Habsburg emperors. Vienna was besieged by the Turks in 1529 and, again, in 1683, but on neither occasion was the city taken. The treaty of peace following the Napoleonic wars was drawn up in Vienna. Population, 1,638,100.

Vimy Ridge. An elevated region of northeastern France, 100 miles north of Paris and about 4 miles northeast of Arras. In May 1917, it was the scene of one of the most bitterly contested struggles in which Canadian troops were engaged during World War I. The ridge had been fortified by the Germans but was relinquished as a result of the battle, which is commemorated by an impressive monument erected by the Canadian government in 1936.

Warsaw (Warszawa). The largest city of Poland, situated on the left bank of the Vistula River. It was the capital of Poland prior to its seizure by Germany in 1939. The old part of Warsaw has many dark, narrow, and squalid lanes, but the new section is quite modern, with wide streets flanked by rows of fine buildings. There are numerous squares, parks, and public gardens. The city has over 30 Catholic and 7 Russian churches, the Catholic Cathedral of Saint John being the largest. Iron bridges connect the city with the prosperous suburb of Praga on the opposite bank of the Vistula.

Among the manufactures are textiles, metal wares, tobacco articles, malt liquors, chemicals, and furniture. Small factories and home industries give employment to many thousands. Population, 1,261,300.

Windsor. A town of southeastern England, on the Thames River about 21 miles west of London Its interest lies chiefly in its parks and its castle, which, since before the time of William the Conqueror, have been a favorite retreat of the English monarchs.

Windsor Castle covers 12 acres of ground in the Home park, which is about 4 miles in circumference. A tree-lined avenue connects this park with the Great park, which has a circuit of 18 miles. The castle, consisting of numerous chapels, cloisters, and apartments, is dominated by the Round Tower, built by Edward III. Population, 29,030.

Ypres (*ē′pr′*). A town of western Belgium about 20 miles from the North Sea. It was the scene of a large number of battles in World War I, being held by the British armies in the face of the most desperate German attacks, made over a period of four years. One of the chief squares contains a monument erected by the Canadian government as a memorial to Canadian soldiers who perished in the sanguinary conflicts near Ypres. The town, almost obliterated as a result of military operations, has a population of 18,121.

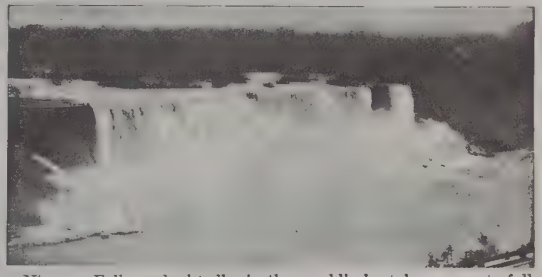
Zurich (*zo͝o′rĭk*) **(Zürich).** The largest city of Switzerland, beautifully situated in the northern part of the country on both banks of the Limmat River as it issues from Lake Zurich. In the older quarter, the streets are narrow, but the newer section is very attractively laid out, its main thoroughfare being a broad boulevard lined with shops comparing well with those of Paris. Zurich is the seat of the Swiss National museum, of the University of Zurich, and of several splendid medieval churches and monasteries. The cathedral known as the Grosse Münster, founded in the 11th century, had Zwingli as one of its pastors.

Zurich is the financial center of Switzerland. Its manufactures include silks, cottons, machinery, paper, and musical instruments. Population, 433,200.

NOTED WATERFALLS

At George VI Falls, in tropical Guyana, the Uitshi River drops 1600 feet.

The Great Falls of the Potomac River, in Maryland, is an interesting and picturesque example of the cascade type of waterfall.

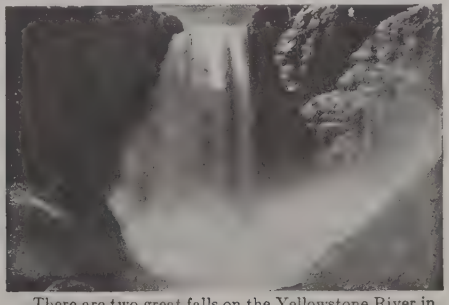


Niagara Falls undoubtedly is the world's best known waterfall. This view shows the American side of the falls, which drops 167 feet.

Montmorency Falls, 265 feet, is one of Canada's most beautiful waterfalls. It is eight miles from Quebec.

Iguassu Falls is on the river which is the boundary between Argentina and Brazil. The water drops 215 feet.

Victoria Falls, on the Zambesi River in South Africa, is 343 feet high and is one of the world's most spectacular.

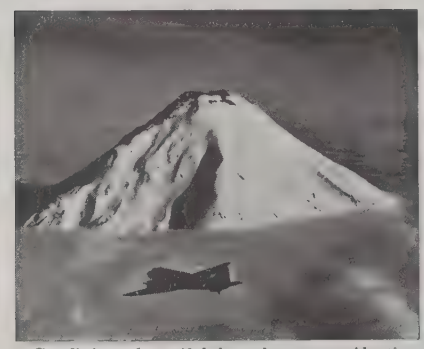


There are two great falls on the Yellowstone River in Wyoming. This is the Lower Falls. It is 310 feet high.

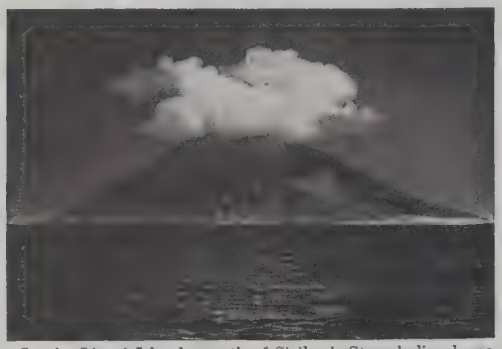
FAMOUS VOLCANOES

The beautifully shaped Mayon volcano rises 8000 feet on Luzon, P. I. It has a perfect cone and is the most active of the Philippine volcanoes. Mayon erupted 26 times during the 19th Century and in 1914 destroyed several villages and killed several persons. The volcanoes in this area are a part of the volcanic mountain chain known as the Circum-Pacific system, often called the "Circle of Fire."

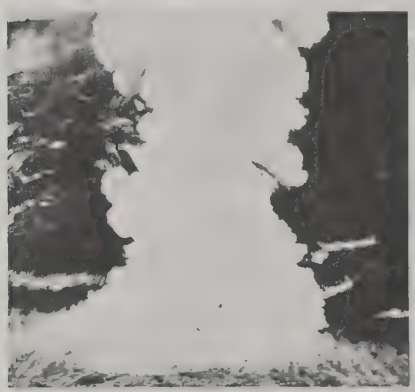
Vesuvius is the world's best-known volcano. It is in Italy, southeast of Naples, and is the only active volcano on the mainland of Europe. Its earliest recorded eruption was in A.D. 79, when it buried Pompeii. Its latest eruption was in 1944.



Caroli is a beautiful but dangerous Aleutian volcano. A wisp of smoke at its top shows that it is active. The most recent Aleutian eruption was Shisaldin volcano, which burst into action in 1947.



On the Lipari Islands, north of Sicily, is Stromboli volcano. It is about 3000 feet high and is called the *Lighthouse of the Mediterranean* because of its activity. In ancient times, these islands were identified with Vulcan, fire god of Roman myths.



Of immense size, the active volcano Mauna Loa on the island of Hawaii is interesting both to tourists and to scientists. It has averaged one eruption every 3½ years since 1832.

Hawaiian Visitors Bureau

Beginning in 1943 with smoke, then lava, issuing from the surface of a cornfield near San Juan, Mexico, Paricutin rose within a year to a height of over 2000 feet.

ASIA

THE largest and the most populous of the continents. It lies entirely in the northern hemisphere and, beginning near the equator, stretches 5270 miles northward to a point within 800 miles of the north pole. Its maximum extent east and west is 6820 miles. Having an area of 17,200,000 square miles, it occupies nearly one-third of the land surface of the globe and is larger than North America and South America combined.

With the exception of Europe on the northwest and of the narrow Isthmus of Suez, Asia is entirely surrounded by water. It has the Arctic Ocean on the north, the Pacific Ocean on the east, and the Indian Ocean on the south. In the southwest, the continent is divided from Africa by a line passing through the Isthmus of Suez, the Red Sea, and the Gulf of Aden. At the northeast extremity, Asia is separated from North America by Bering strait, a neck of water less than 40 miles in width at its narrowest point. The coast line of the continent aggregates about 33,000 miles.

Outline and Islands. The line of demarcation on land between Asia and Europe follows roughly the Ural Mountains and the Caucasus Mountains. The remainder of the western boundary passes through the Caspian Sea and through the three seas which wash the shores of Asia Minor, the continent's farthest westward extension. These three seas are the Black Sea, the Ægean Sea, and the Mediterranean Sea. The Black Sea and the Ægean Sea are connected by the small Sea of Marmora, which communicates with the Black Sea by the Bosporus strait and with the Ægean Sea by the Dardanelles strait.

The coast line has many irregularities. Those on the north are mainly the enlarged mouths of rivers, the only major inlet being Nordenskjöld Sea. On the south, however, there are three large peninsulas separated by two deep indentations. Between Arabia, the most western peninsula, and India, in the center, lies the Arabian Sea, which has two important inlets, each connected by a strait with an inland sea. The Gulf of Aden in the west is joined to the Red Sea by the strait of Bab-el-Mandeb, and the Gulf of Oman at the north of the Arabian Sea communicates by the strait of Ormuz with the Persian gulf. The third great peninsula is Indo-China with its southern extension known as the Malay peninsula. It is separated from India by the Bay of Bengal.

The eastern coast is notable for a series of deep inlets and for an irregular chain of islands stretching from the north to the south. This configuration results in a number of island-bound seas. Bering Sea at the north is confined by the Aleutian islands, which are geographically a part of Alaska. South of Kamchatka peninsula lies the Sea of Okhotsk. The Sea of Japan is enclosed by Sakhalin island and by the islands of Japan, which stretch southwestward toward the southern end of the peninsula of Chosen. The Yellow Sea and the China Sea extend southward to the Taiwan strait, as the channel is called which lies between the island of Formosa and the mainland. The South China Sea, bounded on the east and south by the Philippine Islands and by Borneo, has two large inlets, the Gulf of Tonkin and the Gulf of Siam.

South and east of the continent lies, in an elongated cluster, the largest group of islands in the world. This group, known as the Malay archipelago, extends as far as Australia. This archipelago, together with the numerous smaller islands which continue to dot the Pacific for more than 2000 miles still farther east, is sometimes embraced under the term Oceania. The only other large island off the southern coast is Ceylon, near the southern tip of India. The New Siberian islands and Wrangell island lie well within the Arctic circle to the north.

Surface. Asia has the greatest mean elevation of any of the continents except Antarctica, its surface being, on the average, more than 3000 feet above the sea. Moreover, the continent contains the highest mountain, the highest plateau, the most extensive lowland, the lowest lake, and the deepest lake, in the world.

About 2000 miles north of the southern tip of India lies the plateau of Pamir, often called the roof of the world. This plateau, 11,000 feet in height, forms a central point from which mountain chains radiate, most of them trending in a general east and west direction.

The highest range is that of the Himalaya Mountains, curving from the Pamir plateau to the south and east, where it forms a northern wall of India. Mount Everest, in this range, is the highest peak in the world, having a height of 29,002 feet.

North of the Himalaya Mountains lies the world's highest plateau, Tibet, which has an elevation ranging from 9000 to 17,000 feet. The region is volcanic. To the north of the plateau of Tibet lies, at a lower level, the plateau of Mongolia, largely occupied by the Gobi desert. This plateau is separated from Tibet by the Kunlun mountains. The plateau of Mongolia is confined on the northwest side by an irregular group of mountain ranges stretching northeast from the Pamir plateau. Among these mountains lies the deepest body of fresh water in the world, Lake Baikal, in which soundings of 5306 feet have been taken. Both the plateau of Tibet and the plateau of Mongolia widen toward the east and eventually slope downward to the plains of China in the south and, farther north, to the plains of Manchuria.

Westward from the Pamir plateau, a broad mountainous highland stretches to the extreme western part of the continent in Asia Minor. This region contains the lofty Hindu Kush range and, farther west, Mount Ararat, on which Noah's ark is said to have landed. The highland slopes, on the south, down to the plains of Iraq, which drain toward the Persian gulf. South and west of this drainage basin rises the plateau which occupies the greater part of the Arabian peninsula. The northwestern extremity of the plateau falls rapidly to a basin of inland drainage, which constitutes the most remarkable depression on the face of the earth. The lowest point is occupied by the Dead Sea, the surface of which is almost 1300 feet below the level of the sea.

To the north of Asia's great central highland lies the world's vastest plain. Occupying the whole northern part of the continent, it is sometimes called the Great Northern Lowland. Most of it inclines in steppes very gently toward the north, but in the southwest there is an area of inland drainage, part of which slopes toward the Caspian Sea and part toward the Aral Sea.

To the south of the Himalaya Mountains lie the plains of India. These plains rise on the southern side to a table-land of moderate height, sometimes called the Deccan. On the east, the plains are confined by a number of mountain ridges, which constitute a southern spur from the plateau of Tibet. These mountains lose themselves in the plains of Indo-China and in the Malay peninsula.

The plateau of Mongolia sends a similar spur to the northeast, known as the Stanovoi Mountains, which stretch as far as Bering strait. From this extreme northern point, a partly submerged mountain chain passes south through the ocean, emerging in various places to form the numerous islands off the east coast. Many of these mountains, particularly those in Japan, are actively volcanic.

Drainage. The great central highlands of Asia feed six rivers which exceed 2000 miles in length. Two of them, the Yangtze and the Yenisei, rank among the six longest rivers of the world.

The Ob River, the Yenisei River, and the Lena River are the largest of the streams which take their rise in these highlands and wind slowly through the immense steppes down to broad estuaries at the Arctic Ocean. Their lower courses are icebound eight months in the year. For 100 miles above the mouth of the Lena lies a stretch of frozen silt in which are embedded the remains of numerous mammoths and of other animals which were engulfed in quagmire thousands of years ago.

The three greatest rivers flowing to the east are the Amur, the Hwang, and the Yangtze. Each follows a long, meandering course in the central plateau before descending to the plains and emptying into the waters of the Pacific Ocean. Destructive annual floods frequently follow the melting of the upland snows, particularly in the Hwang river in China, which for that reason is often called "China's sorrow."

The southeastern spur of the plateau of Tibet gives rise to three rivers of southern drainage. Named in order from east to west, they are the Mekong River, the Salwin River, and the Irrawaddy River. The Ganges River and the Brahmaputra River both rise in the Himalaya Mountains and mingle their waters in a common delta at the head of the Bay of Bengal. The Brahmaputra River flows eastward along the northern edge of the Himalayas in the plateau of Tibet and, bending southward and westward, passes through a plain which has a heavier rainfall than any other region of the world. The Ganges throughout most of its course flows eastward. The Indus River rises to the north of the Himalaya Mountains and, passing around the western end of the range, empties into the Arabian Sea.

The plains of Iraq are drained toward the Persian Gulf by the Tigris River, which is joined about 100 miles above its mouth by the celebrated Euphrates River. The Ural River flows into the northern end of the Caspian Sea. The Caspian Sea has no outlet but is itself 86 feet below the level of the ocean. The Aral Sea is the center of another basin of interior drainage. Such basins cover, in Asia, a larger area than in any other continent.

Climate. On account of its range of latitude and of altitude, Asia is subject to a great variety of climate. In the interior of Siberia, temperatures of 92° below zero have been recorded, although in summer on the Arctic coast the thermometer sometimes registers 100°. The hottest part of the continent is in Arabia, where the temperature has reached 120° F. and the average for the year is 93°.

While parts of Assam, in the basin of the Brahmaputra River, have a rainfall of about 500 inches, the rainfall of Asia as a whole is scanty. An arid desert, in which the annual precipitation is less than 10 inches, extends in a broad sweep through the center of the continent from east to west. Beginning with the desert of Gobi in the plateau of Mongolia, it passes through central Asia, Iran, and Arabia. Siberia also has a light rainfall. Japan, the plains of China and of the Indo-China peninsula, the Malay peninsula, and eastern and southern India have a copious and, in parts, an excessive precipitation.

Vegetation. Asia is the original source of more of our important economic plants than all other parts of the world combined. From it come wheat, barley, sugar cane, alfalfa, cotton, flax, jute, hemp, tea; such fruits as the apple, cherry, peach, prune, apricot, banana, olive, orange, lemon, grapefruit, date, and pomegranate; and, in the list of vegetables, the radish, cucumber, muskmelon, onion, parsnip, rhubarb, spinach, and eggplant.

Northern Siberia from east to west contains a strip of tundra, or frozen desert, stretching 150 to 500 miles southward from the Arctic Ocean. In this tundra, a permanently frozen subsoil permits the growth of few plants other than mosses and lichens. Coniferous forests and, farther south, forests of deciduous trees cover the steppes. South of the forests lies an immense belt of treeless plains covered with grass. The grass is replaced by a desert flora toward the arid zone of central Asia.

In the regions of copious rainfall, the plant life is extraordinarily rich, India having more species than any other region of equal area in the world. The sacred peepul and the banyan tree, plants producing ginger, members of the pea family, medicinal plants, orchids, gourds, figs, timber trees, gum producing trees, sago palms, bamboos, and teak are representative of the rich flora south of the Himalaya Mountains. On these mountains grow magnolias and large rhododendrons; higher up, pines are found, and also the deodar, a species of cedar similar to that growing on Mount Lebanon in southwestern Asia. The better watered parts of Arabia still produce, in limited amounts, the spices and fragrant plants which, in earlier days, won for the peninsula the poetic characterization of "Araby the blest."

Animal Life. Asia is the original home of most of the world's domesticated animals, including the horse, ox, sheep, pig, goat, camel, chicken, and goose. The humped ox, the water buffalo, and the yak are used as draft animals by the inhabitants of the continent. The elephant of Asia, unlike the African elephant, is easily domesticated.

The Himalaya Mountains form a barrier north of which the climate is unfavorable to animal life. In the north, however, bears, foxes, and wolves are found, as well as other wild animals which inhabit the corresponding latitudes of Europe. South of the barrier, the fauna is extremely rich. Nearly all the families of tropical birds are represented. India is the home of the tiger. There are several species of the rhinoceros. The deadly cobra takes a yearly toll of many thousands of human lives.

Minerals. The natural resources of Asia have been very inadequately explored. There is reason to believe, however, that the continent is extremely rich in minerals. Coal and iron exist in large quantities in China, and the world's richest source of petroleum is in southwest Asia. Most of the world's supply of tin comes from the Malay peninsula and the islands lying near it.

Inhabitants. It is generally acknowledged that it was in Asia that man first turned to agriculture and built cities. From Asia have come all the most wide-spread religions of the world. It justifiably claims the earliest use of writing. Today it supports a larger population than any other continent, its estimated 1900 million inhabitants being about 60 per cent of the human race.

Asiatic peoples comprise about seven-tenths of the total population of the continent. About one-tenth of the population, however, consists of Caucasians, living in Siberia, India, and southwest Asia. From these regions, the Caucasians emigrated at an early period, spreading over northern Africa and Europe, whence they came later to America. The aborigines of America are believed to have reached the western hemisphere by way of northeastern Asia.

Religion. The most widely embraced religions of Asia today are Buddhism, Confucianism, Mohammedanism, Hinduism, Taoism, and Shintoism. Buddhism, Confucianism, and Taoism center principally in China. Shintoism is the chief religion of Japan. In India, Hinduism competes with Mohammedanism, which is the dominant religion of southwestern Asia. Christianity is strongest in northwestern Asia, chiefly Siberia, and in the islands of the Malay archipelago, in many of which it dominates to the virtual exclusion of others. It has also been introduced by missionaries into China, Japan, and India.

POLITICAL DIVISIONS

Asia is a continent most of whose nations have only recently come into existence. This was due to the conquest of most of Asia by European nations in early modern times and the liquidation of those conquests after World War II.

The following are the chief national states of the continent: Afghanistan, Burma, Cambodia, China, Cyprus, India, Indonesia, Iran, Iraq, Israel, Japan, Jordan, Korea, Kuwait, Laos, Lebanon, Malaysia, Maldive Islands, Pakistan, Philippines, Saudi Arabia, Singapore, Sri Lanka (Ceylon), Syria, Thailand (Siam), Turkey, Vietnam, and Yemen.

In addition, a large section of Asia is part of Russia, whose Asiatic territory is about three times the area of European Russia.

Afghanistan. A republic of south Asia, hemmed in by India, Iran, and Turkestan. Its area is about 250,000 square miles. The surface is, for the most part, a dry, mountainous plateau. It is traversed by the Hindu Kush and by other ranges, which in some places attain a height in excess of 17,000 feet.

The mountainsides have forests of cedar, pine, walnut, and other trees; the valleys support crops of cereals and a variety of fruits. Wheat, rice, and mutton are staple foods. Sheep raising is one of the chief occupations.

The population of Afghanistan is about 16,113,000. The capital is Kabul, a city of about 300,000, which is a center of caravan trade with India and central Asia. There are no railroads in Afghanistan. Herat, in the northwest, contains ruins of many buildings erected by Timur, the Mogul warrior who overran Asia in the 14th century.

Bangladesh. Formerly the East Bengal province of Pakistan, the People's Republic of Bangladesh became independent in December 1971. Bangladesh covers 55,126 square miles and has a population of 71,300,000. The country is bordered by India on the north, east, and west, and by the Bay of Bengal on the south.

Bangladesh is largely a subtropical alluvial plain with many river valleys, deltas, and swamps. The chief rivers are the Ganges and Brahmaputra. In November 1970 the southern Ganges Delta region was destroyed by a cyclonic tidal wave. More than 220,000 people were reported dead and an estimated 350,000 dwellings were either damaged or destroyed.

The country is agricultural, with some 80 to 90 per cent of the population engaged in agriculture. The major crops are rice, jute, sugar cane, tea, tobacco, and oilseeds. Large reserves of natural gas and some coal deposits are being developed by the government through loans from India.

The capital and largest city of Bangladesh is Dacca (1,310,972). Other major cities are Chittagong (416,733) and Chalna (436,000).

Burma. A republic of southeast Asia on the Bay of Bengal adjoining India and Pakistan on the west and China, Laos, and Thailand on the north and east. Its area is 261,789 square miles.

Burma consists of a central basin with the Arakan Yoma mountains to the west on the India border and the Shan plateau in the east. The central basin is watered by the Irrawaddy River running south through a fertile delta and emptying by nine mouths into the Bay of Bengal. Minerals include lead, silver, zinc, nickel, copper, tin, gold, rubies, sapphires, and jade. The forests produce teak and other valuable hardwoods.

Agriculture is the leading occupation, and Burma normally is a heavy exporter of rice. Sugar cane and peanuts are also produced in quantity. Industries include silk weaving, rice husking, oil refining, and wood carving. The Baluchaung hydroelectric plant, completed in 1960, is one of the largest in southeast Asia. Buddhism is the established religion. The leading cities are Rangoon, the capital and chief port, and Mandalay, a river port of Upper Burma.

Burma was given independence in 1948 by Great Britain and dissociated itself from the Commonwealth. Population, 26,389,000.

Cambodia. A republic of southeast Asia bounded north by Thailand and Laos, east by Vietnam, and southwest by the Gulf of Siam. Its 69,884 square miles consist chiefly of an alluvial plain watered by the Mekong River.

Agriculture of a subsistence type is the chief occupation, and rice is the principal crop. Other products include rubber, cotton, tobacco, kapok, and corn. Cattle breeding is an important activity.

From the 9th to the 13th century A.D., Cambodia was ruled by the Khmers, whose monarchs constructed at Angkor magnificent shrines and temples. Their ruins, among the most impressive in southeast Asia, were threatened in 1970 during the Vietnam conflict. Angkor Wat is the best known.

Cambodia was part of French Indochina until 1953 and was a constitutional monarchy for several years thereafter. In 1970 it became a republic. The capital and largest city (pop. 393,995) is Phnom Penh. Population, 6,557,000.

Ceylon. See *Sri Lanka*.

China. The immense, roughly triangular country in eastern Asia lying between Asiatic Russia on the northwest and India, Pakistan, Burma, Laos, and Vietnam on the southwest. It is about 3,000 miles from east to west, and its maximum extent from north to south is 2400 miles. The area of continental China is 3,754,210 square miles. Known as the People's Republic of China (Communist China), it claims but does not control Taiwan (Formosa), which is ruled by the National Republic of China.

People's Republic. Communist China consists of six regions, which include 23 provinces, 4 autonomous regions (including Tibet, conquered in 1950, and Inner Mongolia), and the 2 administrative areas of Peking, the capital, and Shanghai, the largest city.

Three-fifths of the territory of China is inhabited by about 1 per cent of the population. This sparsely settled part, occupied mainly by nomadic tribes, consists of the lofty, mountainous plateau of Tibet, the desert plateau of Mongolia, and the arid depression of inland drainage known as Sinkiang. The remainder of the country embraces the extremely fertile eastern plains, watered by three great rivers, the Hwang, the Yangtze, and the West river. In China proper as well as in the outlying territories, the surface is mainly mountainous. While practically all of the level lands are fertile flood plains, they are subject to disastrous floods.

The climate of China proper, where practically all of the Chinese live, is divided into two main regions, northern and southern. The northern region extends from the crest of the Tsingling and Haiyang mountains to the northern border. It is a temperate region supporting wheat as a major cereal as compared to rice in the southern region. The southern region includes the great Yangtze basin and southward area, with rice as the major climatic adjustment. Northern China is temperate with hot summers, cold winters, and moderate rainfall, while

southern China differs by having mild winters and heavy rainfall. China's rainfall is sharply seasonal, falling mainly in summer.

All of China suffers greatly from droughts and floods which are caused by variations in the Monsoon winds which control China's weather. A 1911 flood of the Yangtze affected 50,000,000 people, directly causing the death of upwards of 100,000 and destroying vast properties. Typhoons, earthquakes, and locusts also plague China.

The deposits of coal, of iron, and of copper in China are among the richest in the world. More than one-half of the world's supply of antimony and tungsten comes from China. The proximity of the coal and the iron deposits in the northeastern district of Shan-si has resulted in a large steel industry. The manufacture of porcelain, centering since 220 A. D. in Kingtehchen, a city of about 266,000 inhabitants, is still a distinctive industry of the country. Lacquered ware and textiles of silk and of cotton are other native manufactures for which China has long been noted. In the north are vast deposits of oil shale which are being processed. This region also has a large share of China's coal and iron reserves plus considerable industrial development.

The chief occupation of the Chinese, however, is agriculture, which is carried on more intensively than anywhere else in the world. The soil is very fertile, and irrigation by canals and by irrigation wheels or even by hand is employed where necessary. Rotation of crops has been practiced for centuries. The chief crops include rice, corn, tobacco, soy beans, tea, cotton, and sugar cane, the last three being grown in the southern part of the country. The mulberry tree is cultivated largely for the silkworms which feed on it and from which silk is obtained. Soy beans and silk are the most valuable articles of export. Other important exports are textiles, tea, coal, and cotton. Chickens and pigs are raised everywhere in China, and pig's bristles have become an important article of export. China's farm problems are complex also because 80 per cent of the people live on farms and must depend on farming for their existence. Farm land per capita is only a fraction of an acre (0.45) or 1485 people for each square mile of agricultural land. While her total production of such important crops as wheat and rice are among the largest in the world, probably totaling upwards of 3 billion bushels, it scarcely suffices to feed her huge population who depend upon cereals for 90 per cent of their diet. The Communist government attacked the problem by nationalizing land and trying, in the 1960's, to industrialize farm work by so-called communes.

By 1960, about 20,000 miles of railroad had been constructed in China. The so-called Grand Canal, running from the city of Hangchow a distance of 600 miles north to the Gulf of Chihli, was built 2500 years ago. Parts of it are choked with silt. In 1960, there were more than 250,000 miles of highways. A large part of the country's transportation is provided by the rivers, along which ply numerous "junks" and other boats. Thousands of people live on the rivers in house boats, which are often equipped with gardens made in soil laid on the floors of the boats.

Chinese civilization is ancient and distinctive. For thousands of years, the veneration of parents remained a cardinal principle of Chinese religion, law, and social customs. These cardinal principles of Chinese religion and philosophy were tremendously impressed upon the Chinese people by the zealous teaching of the great philosopher Confucius and his disciple Mencius. This principle encouraged a high birth rate, which, despite recurrent famines, has kept the population of China well above the limits which the country could readily support. The chief religions are Buddhism, Confucianism, and Taoism. About 4 per cent are Mohammedans, and less than 1 per cent are Christians.

As a people, the Chinese have adapted themselves to both cold and hot countries, having settled in large numbers both in the northern remote border regions and in the countries of southeast Asia. In several of the latter countries, they form the principal class of traders. A 30-letter alphabet of the Latin type is gradually replacing the 30,000 characters of the Chinese script.

The impact of western civilization plunged China into social and political chaos. Industrialization, beginning with the manufacture of textiles, flour, and steel, tended to break up the authority of the family. Western ideas of freedom were followed by Communism as a means of catching up with the western economy. But none of the desperate expedients was as effective as, for example, the parallel modernization of Japan's economy.

Apart from the capital, Peking, and Shanghai, the largest city, Communist China's leading cities are Tientsen, Shenyang (formerly Mukden), Wuhan (including former Hankow), Chungking, Canton, and Nanking, which was the capital before the Communist regime. Population, 1968 UN est., 730,000,000.

National Republic. The government of the Chinese National Republic, taking refuge from the Communists, retreated in 1950 to Taiwan (Formosa), an island 13,890 square miles in area, 110 miles off the east coast of the mainland. Lying in a generally north-and-south position, it is 225 miles long and 80 miles across at its widest point. It is traversed axially by a mountain range, steep on the eastern side but sloping gradually on the west to a fertile plain, which is intensively cultivated and produces exportable surpluses of rice and sugar cane. Its extensive forests are the world's chief source of camphor. Mineral output includes gold, silver, copper, and coal. Taiwan's rapidly growing industry produces steel, aluminum, lumber, flour, cement, paper, fertilizers, and refined oil.

Taiwan was held by Japan from 1895 until 1945. After the Nationalist Chinese government took refuge there, the economy of the island was rapidly expanded, partly with aid from the United States, which guaranteed the island's independence and strengthened its armed forces. The capital is Taipei, with a population of 1,155,191. Population of Taiwan, 13,466,000.

Cyprus. An island republic in the northeastern part of the Mediterranean Sea, 3572 square miles in area, with a length of 140 miles east and west and a maximum width of 60 miles. Agriculture is the predominant industry, which provides exports of tropical fruits, wine, potatoes, and tobacco. The most valuable export is copper concentrate, as it was in ancient times, the name of the island being the Greek word for *copper*. The inhabitants are partly Greek and partly Turks. The capital is Nicosia. Population, 622,000.

India. A republic occupying the large southern Asiatic peninsula separating the Indian Ocean on the east and the Arabian Sea on the west. Its northern boundary lies against China and Nepal; the land boundary to the west is Pakistan and to the east are Bangladesh and Burma. India has an area of 1,262,275 square miles.

India has a northern mountain wall, south of which the surface falls to a great plain arid in the extreme west but well watered in the central and eastern regions. Through this plain, which is shared by Pakistan, pass the Indus River and the Ganges River, the latter being joined at its delta by the Brahmaputra River. From the head

of the Bay of Bengal, a mountain barrier runs north to the Himalaya Mountains and divides India from Pakistan.

On India's side of the Himalayas are two nominally independent mountain kingdoms, Nepal to the west and Bhutan to the east, with a feudal form of organization. Nepal, with an area of about 56,400 square miles, supports a population estimated at 11,700,000. Livestock is the basis of its economy, which includes manufacture of cement and chemicals. Bhutan has an area of 18,000 square miles and about one million inhabitants. It barters rice, cloth, elephants, and swords.

The central plains of India are the hottest part of the country. The year is divided into three seasons, the hot season, the monsoon rains, and the cold season. The hot season is from late March to early June. In central India temperatures rise daily to over 100° F. in the shade and at times 120° F. Day and night the temperature stands between 95° F. and 115° F. and little outside work can be accomplished during midday.

With the coming of the rainy season, June to mid-September, the temperatures fall appreciably and daily rains prevail. A secondary heat period follows the rainy season, from mid-September to November, when the cold season sets in. This "cold" season is about like summer in northern United States except that no rain falls in India.

Over most of India frost and snow are unknown. Only in the far northwest and in high altitudes do temperatures descend below freezing.

India is a land of great climatic extremes. The droughts caused by failure of the monsoon rains cause famines when literally millions have starved to death. Typhoons bring havoc to both coasts of the Deccan. During the rainy season the heaviest rainfall known in the world falls on the windward side of the Khasi Hills. Over 38 feet (457.8 in.) of rain falls here annually between late March and early October. During a particularly wet year 905 inches (75 feet) of rain fell at the station of Cherrapunji and on one day 41 inches, the equal of a year of rainfall in central United States. A great climatic variation is provided by the towering Himalayas which provide important summer resorts, as at Simla. The eastern regions and a strip along the western coast have a heavy rainfall, confined mainly to the rainy season—June to November. The northwestern section is dry, but the land is productive under irrigation. Irrigation works in India dwarf those of any other country except China. Over 50 million acres of crop land is thus served, mainly by means of canals.

The vegetable and animal life of India is extremely rich, comprising nearly all the tropical species of the continent. Venomous snakes are numerous, and every year their human victims are numbered by the thousand. Man-eating tigers have been known to cause whole villages to be deserted. Crocodiles infest the malarial swamps at the mouths of the large rivers. A species of loud-voiced lizard abounds in all the moister regions.

More than two-thirds of the population of India supports itself by agriculture and stock raising. India is the world's chief producer of jute and one of the largest producers of cotton and tea, the latter being the leading export. The other chief crops are wheat, rice, sugar cane, lac, wool, and nuts. The livestock consists mainly of humped oxen, buffaloes, sheep, and goats. Buffaloes are far more numerous as beasts of burden than are horses, donkeys, or camels. India possesses more cattle than any other country in the world, but, by reason of low quality, their value is not comparable.

Mineral production includes gold, petroleum, manganese, salt, chromium, copper, titanium, china clay, gypsum, and iron. Steel, cement, and fertilizers are among the significant manufactures but textiles form the leading industrial product. Traditionally, India has absorbed enormous amounts of gold and silver for ornaments and treasure.

The estimated population of India is 605 million, of whom about 80 per cent are Hindu, 10 per cent Mohammedan, and 2 per cent Christian. Some 220 different languages are spoken, but the prevailing one is Hindi, and English is known to several million people, a legacy of 200 years of British rule. About 70 per cent of the population is illiterate. Religion plays a large role in Indian life, a feature of which is the prevalence of pilgrimages to the holy city of Benares and bathing in the sacred waters of the Ganges to remove physical and spiritual ills. Agra has a world-famed mausoleum, the Taj Mahal, built in 1629–50 by Emperor Shah Jehan as the burial place for his favorite wife, Mumtaz Mahal.

India became a sovereign republic in 1950 after a long period of struggle, in the course of which the former British India was divided into India, which was predominantly Hindu, and Pakistan, which was predominantly Mohammedan. Extensive population changes took place after the boundaries were agreed upon. India was the first republic to adhere to the British Commonwealth of Nations.

The capital of India is New Delhi, and Bombay is the largest city. Other important cities include Calcutta, Madras, Bangalore, and Kanpur.

Indonesia. A republic of southeastern Asia consisting of seven principal islands and 3000 islets of the Malay Archipelago. It stretches 3000 miles from the Malay Peninsula eastward toward Australia and lies across the equator between the Indian and Pacific oceans. The republic's area is 575,450 square miles. The island of New Guinea is divided between Indonesia and Malaysia.

The western islands of the archipelago, Sumatra, Java, Bali, and Borneo, lie in a shallow sea. This fact and their common flora and fauna indicate that the islands were once a part of the continent of Asia. The eastern islands of the Indonesian Republic offer a striking contrast to the western group. The eastern islands comprise Celebes, the Moluccas, and the lesser Sunda chain from Lombok to the Tanimbar group. These rise abruptly from deep sea basins. They have steep, rugged mountains, short rivers, and narrow coastal plains.

The islands are fertile, warm, and well watered. They show an extraordinary degree of productivity, the exports in some years exceeding $500 million in value. Rice, corn, cassava, tea, sugar, quinine, coffee, rubber, tobacco, indigo, copra, petroleum, and tin are the chief products. Coal is mined also, the annual production exceeding one million tons. Among the more noteworthy forest trees are the teak and the upas.

The island of Java, with 60 million inhabitants, is one of the three most populous islands of the world. Its beauty and tropical luxuriance have won for it the characterization of the "pearl of the East Indies." At Boro Budor in Java stands one of the architectural marvels of the world, the largest and one of the most elaborate Buddhist temples in existence. The island of Bali, east of Java, is a mecca for tourists because of its beauty and picturesque inhabitants.

The capital of Indonesia is Jakarta. Until after World War II, Indonesia was a dependency of the Netherlands. Population, 132 million, est.

Iran (*ē-rän'*). A constitutional monarchy of southwest Asia, formerly known as Persia, with a southern coast line on the Persian Gulf and Arabian Sea. Its northern border, interrupted by the Caspian Sea, adjoins Russia. It is bounded west by Turkey and Iraq and east by Afghanistan and Pakistan. Its surface, covering 627,000 square miles, is a plateau rimmed by mountains on every side except the east. Mount Demavend is 18,500 feet high.

A narrow plain on the southern coast of the Caspian Sea has a heavy rainfall and supports a luxuriant vegetation. Nearly all the remainder of the country is dry and barren. The former name, Persia, gave its name to the peach, the English word

being a corruption of the Latin word for Persian. The chief products of the country include petroleum, cotton, tobacco, rice, silk, wool, gums, fruits, opium, cereals, and the famous Persian rugs, the last being made entirely on looms operated by hand. Petroleum accounts for about half the total value of the exports.

The population of Iran is 26,985,000. Of this number, about one-third lead a nomadic life. Most of the inhabitants are Mohammedans, although there is a group of about 10,000 Parsis, or Ghebers, adherents of the ancient Persian religion that flourished as early as the 6th century B.C. Tehran is the capital and largest city of Iran.

Iraq. Formerly known as Mesopotamia, this country of 172,000 square miles stretches northwest from the Persian Gulf to Turkey and Syria. It lies between Iran and Arabia, and occupies the Tigris-Euphrates valley, where 19th-century excavations uncovered very complete records of an ancient civilization. The rich soil yields crops of dates, cotton, and wheat. Petroleum, the chief mineral product, provides most of the national income. The population, mainly Arabs and Kurds, is about 8,634,000. The capital is Baghdad.

Israel. A republic situated on the southeastern coast of the Mediterranean Sea and occupying most of the territory historically designated as Palestine. It is bounded north by Syria and Jordan and south by Saudi Arabia and Egypt. Israel, with a 7993-square-mile area, was established by its founders in 1948 as a national home for the Jews. In the 6-day Israeli-Arab war, June 1967, Israel successfully occupied the Sinai Peninsula, the Gaza Strip, the western bank of the Jordan, and a small area in Syria. Israel still held these areas in 1970, pending direct Arab negotiations and assurance from Egypt of the same shipping rights to the Suez Canal as other nations.

Agriculture in Israel consists of mixed farming under irrigation, dry farming, and grazing of farm animals, most of its area giving returns if properly irrigated. The industry is carried on in several ways—by communal settlements, cooperative settlements, and villages where each settler owns his own land. Products include grain, cotton, grapes, bananas, and especially citrus fruits, which form the chief item of export.

Manufactures include chemicals, building materials, textiles, glass and ceramics, tobacco products, leather goods, precision instruments, and electrical goods. Electric power is distributed from Tiberias, Haifa, and Tel Aviv.

The capital is Jerusalem. A Hebrew university there was founded in 1925. Military service is required of both men and women. Nearly 90 per cent of the inhabitants are Jews, and about half of the remainder are Arabs. Population, 2,745,000.

Japan. An ancient empire, consisting of a chain of mountainous islands off the eastern coast of Asia. The largest island is called Honshu. To the north lies Hokkaido, or Yezo; to the south, Shikoku and Kyushu. Its area is 142,726 square miles.

The islands of Japan, being the projecting portions of an immense submarine mountain range, have a mountainous surface, traversed from end to end by a high ridge. Numerous spurs from the mountains, descending to the coasts, result in a highly irregular coast line. There is, consequently, an abundance of good harbors, most of which are on the Pacific side.

The highest mountain in Honshu is Fuji, 12,388 feet in altitude. There is probably no region of its size in the world which has so many active volcanoes and is subject to such violent earthquakes as Japan. The largest active volcanic peak is Asama in central Honshu, which has a crater 600 to 800 feet deep with absolutely perpendicular sides.

The climate of Japan varies from subarctic to subtropical conditions. The cold northwestern winds from Siberia bring heavy snows in winter on the western side of the northern islands. Farther south, and more especially on the eastern side, the ocean exerts a moderating influence on the temperature and provides a copious rainfall. Violent and destructive windstorms, known as typhoons, usually mark the end of the hot, moist summers.

Japan has a very rich flora. The forests contain such trees as bamboos, camphor trees, oaks, maples, walnuts, laurels, and willows. The cultivation of flowering plants is very extensive, the Japanese being noted for their appreciation of floral beauty. Their national emblem is the chrysanthemum.

The animals include bears, monkeys, hares, wild boars, deer, foxes, wildcats, and pheasants. The buffalo is used for food and for plowing. The crane is considered sacred, being regarded as a symbol of longevity. The silkworm and numerous kinds of fish are of great economic importance.

Japan's mineral resources are gold, silver, copper, and petroleum. The chief occupations are agriculture—rice, fish, wheat, barley, rye, and poultry being the staple foods; fishing, which supports almost a million workers; and manufacturing. Export products are textiles, machinery, motor vehicles, electronic equipment, optical and other precision instruments, sewing machines, pianos, and organs. Japan leads the world in shipbuilding, and ranks second in auto production. Despite the lack of iron ore, it is also a leading producer of steel.

There is complete freedom of religion. The chief forms are Shintoism and Buddhism. Nine years of education are compulsory. There are 37 universities in the empire.

The capital and largest city is Tokyo. Osaka, the principal port, was the site of Expo '70. Other important cities are Kobe, Kyoto, Nagoya, Yokohama, and Nagasaki. The government is a constitutional monarchy under an emperor. Population, 101,090,000.

Jordan. A semi-desert Arab kingdom in Palestine east of Israel. It is bounded north by Syria and south and east by Saudi Arabia and Iraq. More than half the country's 37,301 square miles is desert. Crops of citrus fruits, vegetables, olives, barley, and wheat are grown in the fertile western part of Jordan. Industrial products are tobacco, olive oil, flour, textiles, plastics, and cement. Its only minerals are potash from the Dead Sea, and phosphate, a valuable export. Aqaba is the only port. The capital is Amman.

Education is progressing slowly. Arabic, the official language, and English are taught in the schools. Population, 2,039,000.

Korea. The peninsula of Korea in eastern Asia extending southeast about 600 miles from China and separating the Sea of Japan from the Yellow Sea is occupied by a nation divided as an aftermath of World War II. The dividing line is the 38th parallel of latitude, which separates South Korea from North Korea. The peninsula, 85,266 square miles in area with a maximum width of 350 miles, is a beautiful land of sparkling streams and high mountains. The northern part has cold winters and short summers, but the southern part has a warm, moist, rich climate. The Korean people have a history going back before Christ. China seized Korea in 1667; Japan annexed it in 1910.

South Korea. The Republic of Korea, 38,452 square miles in area, is predominantly agricultural in character, with rice the leading product, but other cereal grains are raised as well as cotton and tobacco. The country is one of the world's chief suppliers of tungsten and graphite. Manufacturing is concentrated in light consumer goods. Fishing is a leading industry.

The capital of South Korea is Seoul, with a population of 3,800,000. Pusan is the leading port. The population of South Korea is 30,470,000.

North Korea. The Democratic People's Republic of Korea, covering 46,814 square miles, is a Communist regime. It is richer in minerals than South Korea, the leading products being iron, coal, tungsten, gold, silver, and petroleum. Agriculture, largely mechanized since the war, produces temperate zone crops. Manufacturing, powered partly by several large hydroelectric projects, turns out steel, chemicals, cement, textiles, and fertilizers. As with South Korea, fishing is a leading occupation.

The capital is Pyongyang, with 653,100 inhabitants. Population, 13,000,000.

Kuwait. A small, oil-rich sheikdom on the northeast corner of the Persian Gulf and adjoining Saudi Arabia and Iraq. Its 9375 square miles are waterless and barren except for their petroleum. Constitutional government on the British model was established in 1963. Population, 540,000.

Laos. A kingdom of southeastern Asia bounded north and east by China and Vietnam, south by Cambodia, and west by Thailand and Burma. Its area of 88,780 square miles is covered in the north by tropical forests and, in the south, by agricultural land producing rice, corn, tobacco, citrus fruits, and opium. About 90 per cent of the inhabitants are engaged in agriculture. There are rich iron ore deposits, but they are not mined. The forests produce teak and other valuable hardwoods.

Laos was part of French Indochina until after World War II, when it declared its independence and was a cockpit of strife between Communists and their foes. French is still one of the official languages. The capital is Vientiane. Population, 2,825,000.

Lebanon. A country on the eastern end of the Mediterranean Sea immediately north of Israel. It is bounded north and east by Syria. North to south it measures about 135 miles with a width of 20 to 35 miles. Most of its area of 3400 square miles is mountainous. About one-fourth is cultivated, the principal crops being oranges, apples, grapes, olives, wheat, and potatoes. Tripoli and Sidon are the terminals of oil pipe lines from Iraq and Saudi Arabia, respectively.

The capital is Beirut. Lebanon has a population of 2,580,000, and was a French dependency until after World War II.

Malaysia. A constitutional monarchy of southeastern Asia comprising most of the southern portion of the Malay Peninsula. It included also Singapore at the southern tip of the peninsula prior to 1965, when Singapore separated. Malaysia's area is estimated at 128,338 square miles.

The wealth of Malaysia is based in considerable part on rubber and tin. Agricultural products comprise chiefly rice, coconuts, and tea. Exports pass mainly through the port of Singapore.

The population is predominantly Malay, whereas in Singapore the Chinese were in the majority and controlled trade there and in Sarawak and North Borneo. This divergence underlay the separation. The capital is Kuala Lumpur in the State of Malaya. Malaysia's population is estimated at 10,384,000.

Maldive Islands. A republic occupying a coral island in the Indian Ocean 300 miles southwest of India. It was a British dependency until 1965. The area is 115 square miles. Population, 106,000.

Pakistan. A civil war in 1971 caused the separation of East and West Pakistan. West Pakistan became the Islamic Republic of Pakistan; East Pakistan became Bangladesh. Pakistan covers 310,403 square miles and is bounded on the south by the Arabian Sea, on the east by India, on the north by China and Afghanistan, and on the west by Iran. The country's landscape varies greatly. The northern part of the country is dominated by the Karakoram and Himalaya mountain ranges; from the foothills of these mountains stretches a barren plain. The fertile Indus plain of the southern and central region is watered by the country's only major river—the Indus.

Pakistan is largely agricultural, much of its exports are grains. The major crops are wheat, cotton, maize, sugar cane, rice, fruits, and dates.

The development of reserves of crude oil and large reserves of natural gas supplies the expanding industries of Pakistan. Principal industries include woolen and cotton products, cement, and refined sugar. Fishing is also a major source of income. Pakistan's chief trade partners are the U.S., Japan, West Germany, and Britain.

Pakistan's 1972 population was 64,890,000, with 235,000 living in the capital city of Islamabad. Other major cities include Karachi (3,469,000), Lahore (2,148,000), Lyallpur (820,000), and Rawalpindi (615,000).

Philippines. An island republic forming the most northern division of the great Malay archipelago. The Philippines lie southeast of China, about 500 miles from its coast, and are bounded on the north and the east by the Pacific Ocean, on the south by the Celebes Sea, and on the west by the South China Sea. The island group is situated north of the equator but entirely within the tropics. It extends north and south for a distance of 1150 miles and east and west for a distance of 650 miles.

There are upwards of 7000 islands and islets, of which only 466 have areas of one square mile or over. Luzon, 40,420 square miles, and Mindanao, 36,537 square miles, rank among the large islands of the world.

Besides the two largest islands, there are 9 others of importance. Their names and approximate areas in square miles are as follows: Samar, 5100; Negros, 4900; Palawan, 4500; Panay, 4450; Mindoro, 3800; Leyte, 2800; Cebu, 1700; Bohol, 1550; and Masbate, 1250. The total area of the entire Philippine group is approximately 115,507 square miles. The population of the islands, 35,993,000.

The islands of the Philippine Archipelago are largely volcanic. There are 12 volcanoes which have been more or less active in modern times, and slight earthquakes are of frequent occurrence. The islands are traversed by irregular mountain ranges, the main ridges of which extend usually in a north-and-south direction. In Luzon, the mountains rise to heights of from 3500 to 4500 feet. Mount Apo, in southern Mindanao, with an elevation of 9690 feet, is the highest peak in the Philippines.

In the larger islands, there are extensive drainage systems. The Cagayan River, in Luzon, 220 miles in length, with a drainage basin of some 10,000 square miles, is the largest river in the Philippines.

The principal minerals are gold, silver, lead, zinc, copper manganese, chromite, iron, mercury, coal, and salt, though none is extensively exploited.

The plant life is distinctly tropical in character and is especially rich in trees. Primeval forests cover about half the area, abounding in dyewoods, cedars, ebonies, wild rubber, and many other valuable trees. The most valuable native plant is the abaca, which yields the fiber called manila hemp. Other products of the Philippine flora include coconuts, cinnamon, pepper, cloves, rattan, and gums.

The islands, while poor in native mammals, are rich in birds, about half of their 700 species being found only in the Philippines. Bright hued tropical birds include parakeets, cockatoos, firebirds, fairy bluebirds, and sunbirds. Among the larger mammals are the timariu (related to the water buffalo), monkeys, deer, wild hogs, civet cats, and fruit bats.

The commonest domestic animal is the water buffalo. Agriculture employs about 60 per cent of the inhabitants. The chief products are rice, manila hemp, copra, sugar cane, corn, tobacco, sweet potatoes, and bananas.

Manufacture is chiefly in homes, though there is factory production of coconut-oil, rice, cigarettes, shoes, sugar, and cement. Home industries turn out embroidery, hats, cloth, baskets, and pottery.

About 90 per cent of the 35,993,000 inhabitants are of the Malay race and profess Christianity, the Filipinos being the only Asiatic people who, in modern times, have in large part embraced Christianity. The other inhabitants are largely Mohammedans and pagan tribes living in the mountains. The original inhabitants were Negritos, a low-statured race of whom about 25,000 remain. Mohammedan Malays are called Moros. The official language is based on Tagalog, although English is the main language of instruction.

The Philippine Islands were discovered in 1521 by Magellan. A Spanish expedition in 1542 named them in honor of Philip II of Spain. Spain began their conquest in 1565 and founded Manila in 1571. They were ceded to the U.S. in 1899 as a result of the Spanish-American War. In 1934, the U.S. granted semi-independent status, effective in 1935, intended to lead ten years later to independence. On July 4, 1946, the islands became independent as the Republic of the Philippines.

In 1970, several powerful typhoons roared across the islands with an estimated 300 deaths and property loss in the millions. Manila, hardest hit, is the largest city, population about 3,100,000. The capital is Quezon City, population 501,800.

Russia in Asia. Russian territory in Asia covers 5,816,000 square miles, which is nearly three times the area of European Russia. The larger part is comprised in the Russian Socialist Federal Soviet Republic (R.S.F.S.R.), subdivided into the Far Eastern area, the Yakutsk autonomous republic, the Siberian area, and many smaller units. In addition, Asiatic Russia comprises eight states which are federated with the R.S.F.S.R. in the Soviet Union. These are the three Transcaucasian republics of Armenia, Georgia, and Azerbaidzhan, between the Caspian and Black seas: and the Turkmen, Uzbek, Tadzhik, Kazakh, and Kirghiz republics, situated north of India, Afghanistan, and Iran (Persia).

Geographically, this huge territory may be divided into three parts—the Great Northern Lowland, over four million square miles in area, which has mainly a northern drainage into the Arctic Ocean; the semi-arid region of Central Asia, some 1,700,000 square miles in area, with an interior drainage into the Caspian and Aral seas; and Transcaucasia, a dry, mountainous, subtropical region of about 75,000 square miles.

The Great Northern Lowland, formerly comprised largely under the name of Siberia, has on the whole a severe winter climate. The northern belt is barren tundra. An intermediate belt of forested land, stretching east and west, is suitable for dairying and flax culture and has enormous lumber resources. The southernmost belt is an immense grassland plain, potentially one of the great wheat areas of the world. The two latter belts, until recently very sparsely inhabited, are in the process of rapid settlement. They are served by the Trans-Siberian railroad. The Ural area, in the west, contains one of the richest iron deposits of the world. One of the world's largest steel plants was erected in 1932 at Magnitogorsk.

Transcaucasia has a subtropical climate. Its principal industry is the production and refining of petroleum, which centers about Baku.

The principal cities of Transcaucasia include Baku, Tiflis, and Batumi; those of Central Asia, Tashkent, Bukhara, and Samarkand; and those of the Great Northern Lowland, Omsk, Sverdlovsk, Novosibirsk, Vladivostok, and Irkutsk.

Saudi Arabia. A desert kingdom occupying four-fifths of the Arabian peninsula in southwestern Asia. Having an area of about 870,000 square miles, it is bounded west by the Red Sea and Egypt, north by Jordan and Iraq, east by Kuwait and the Persian Gulf, and south by Yemen, Southern Yemen, and Oman, which border on the Arabian Sea.

The highlands of the west, 9000 feet high, slope down to 2000 feet at the Persian Gulf. This plateau is an arid, barren desert, inhabited by wandering tribes of Bedouins. Camels are the chief form of wealth among the tribesmen, who maintain themselves at oases. Mainly from the oases also come agricultural products, including dates, honey, hides, wool, barley, and clarified butter known as ghi.

Saudi Arabia is one of the richest oil-producing regions of the world, and oil royalties provide most of the income of the country, paying expenses of government and providing free medical service to the inhabitants.

The capital is Riyadh. Mecca and Medina are the two sacred cities of the Mohammedan world, and pilgrims and tourists visit them in great numbers. The country is an earlier amalgamation of two kingdoms, Hejaz and Nejd. Several other shiekdoms are associated with Saudi Arabia, including Oman at the southeastern extremity of the peninsula. Population of Saudi Arabia, about 7,100,000.

Singapore. See *Malaysia* and article on the city of Singapore.

Sri Lanka (Ceylon). An island member of the Commonwealth of Nations in the Indian Ocean near the southern tip of India. The surface (25,332 square miles) is mainly a rolling plain, about one-fifth being mountainous and covered with forests. The island is famous for gems, although the export of tea, rubber, and coconuts exceed in value any other export. Other products are cocoa, cinnamon, and coffee. Graphite is mined and salt and cement are produced. The capital and largest city is Colombo. Some 70 per cent of the people are Buddhists and of Singhalese origin; 20 per cent are Hindus of Tamil extraction and originally from India. The population is 12,711,000.

Syria. A republic of western Asia bounded west by the Mediterranean Sea and Lebanon, north by Turkey, east by Iraq, and south by Jordan and Israel. It has an area of 71,210 square miles and a population of 5,738,000. Although most of the people are Sunni Moslems, some 500,000 are nomadic Bedouins. It is traversed by the Orontes and Euphrates rivers. Damascus, the capital, with a population of 618,457, is the oldest inhabited city in the world. Syria was under French rule before World War II. In 1958, it joined Egypt to form the United Arab Republic, but a revolt in 1961 broke the tie.

Only about half of the area is suitable for farming. Sandy deserts are common. Tobacco, wheat, fruits, cotton, barley, corn, sorghums, hemp, and silk are produced. Besides foodstuffs, manufactures include matches, alcohol, soap, cotton cloth, and cement. There are agricultural, engineering and teacher-training colleges as well as universities in Damascus and Aleppo.

Thailand (*tī'lănd*) **(Siam).** An independent kingdom of southeastern Asia, bounded west by Burma, north and east by Laos, and south by Cambodia. It has a southern coast line on the Gulf of Siam. The area of the country is 200,148 square miles.

The richest part of Thailand is the wet, tropical valley of the Menam River. This river valley lies between a western mountain wall and a central plateau that divides the Menam River basin from the western reaches of the Mekong River system. The valley produces valuable timber and dyewoods. Agriculture is carried on intensively. Rice is the national food and is the staple article of export. The live stock of the country consists mainly of oxen and buffaloes but includes several thousand elephants. The white elephant, really a light ashy gray in color, is considered sacred by the inhabitants. Tin is the chief mineral produced on a commercial scale.

The population of Thailand is 33,693,000 (1968 est.). Buddhism is the prevailing religion. Thai-

land has, in recent years, introduced many of the methods of Western civilization, having employed the services of European and American advisers in finance, education, drainage, and many other departments. The capital is Bangkok.

Turkey. A republic of west Asia occupying the whole of Asia Minor and extending eastward to Transcaucasia and Iran. It includes also a number of islands off the coast and a small district of Europe, in which the city of Istanbul is situated. Asiatic Turkey is sometimes called Anatolia.

The area of Turkey is 296,108 square miles, including 9257 square miles in Europe. It consists mainly of a plateau which, except in the mountainous eastern region, sinks on all sides to wooded foothills cut by valleys leading to the sea. The northern coast district is most heavily wooded; the chief region of cultivation is on the west. The interior, particularly the eastern part, is hot and dry.

The principal occupation of the Turks is agriculture. Tobacco, cereals, cotton, figs, grapes, olives, and sugar beets are the chief products of the soil. Mineral wealth is considerable but is undeveloped. Meerschaum is a distinctive product. Manufactures are confined mostly to handmade articles, including rugs and copper utensils, although lumber mills, cement works, and an automobile assembly plant have been opened in recent years.

The population of Turkey is 40,197,669 (1975 est.). The seat of government is Ankara.

Vietnam. A country of southeast Asia fronting eastward and southward on the South China Sea and extending from China on the north along the borders of Laos and Cambodia on the west. Formerly a part of French Indochina, it was occupied by the Japanese in World War II, and French efforts to reassume their control ended in defeat, after eight years, by local Communist forces aided by the Chinese. A role of neutrality was agreed on in 1954 by interested powers, including the United States, and a commission was set up to establish a government. The northern part refused to cooperate and set up a Communist government on the Chinese model. The southern part set up a republic in 1954, and hostilities continued between the two parts.

After more than two decades of warfare, U.S. troops were withdrawn from the North-South conflict in 1973. In 1975 South Vietnam was defeated and the country was united under the Socialist Republic of the North.

South Vietnam. The former republic of Vietnam has an area of 66,263 square miles. Predominantly agricultural, it exports rice, rubber, tea, coffee, quinine, tobacco, cinnamon, and silk. There is no heavy industry, but light industry includes weaving and the manufacture of textiles, pens, bicycles, radios, sewing machines, and many other articles. The capital was Saigon (now Ho Chi Minh City). The inhabitants are concentrated in the fertile delta of the Mekong River. Population, over 20 million in 1976.

North Vietnam. The Democratic Republic of Vietnam, 63,344 square miles in area, contained the richer part of the former French dependency. Its mineral output includes coal and phosphates. Rice is the chief agricultural product and practically all is grown by peasants grouped in agricultural cooperatives. All business is state-owned. Manufactured products include cement, cotton, and silk textiles, chemicals, and plywood. Hanoi is the capital and Haiphong is the chief port. Population, 23,787,375 (1974).

Yemen. A mountainous republic at the tip of the Arabian peninsula, bounded north by Saudi Arabia, east by Southern Yemen, and west by the Red Sea. Grown in the most fertile part of its 75,000-square-mile area are coffee and grain. Hides, dates, herbs, and fruit are exported. Hodeida, on the Red Sea, is the chief port. Sana, its capital, is an archeological site. Population, 6,500,000.

CITIES AND OTHER POINTS OF TRAVEL INTEREST

The following articles describe the principal cities of Asia. Most of these cities present an appearance in which the marks of ancient civilizations contrast strikingly with the changes introduced by a rapidly penetrating industrialization. A number of other notable features are described, such as the Dead Sea, the world's lowest and saltiest body of water; Tai Shan, the sacred mountain of Confucianists; and the Malay archipelago, the largest group of islands in the world.

Agra (*ä'grä*). A walled city of northern central India. The Mogul emperors left in Agra several monuments of striking magnificence, including the Taj Mahal, "Gem of Buildings," a white marble mausoleum, the construction of which is said to have engaged 20,000 workmen for 22 years. The city has a large trade. Its industries include gem setting and inlaid mosaic work. Population, 637,785.

Amernath. A cave in the Himalaya mountains near the extreme northern border of India. In the cave stands the sacred symbol of the god Siva, which is the object of pilgrimages from all parts of India.

Ankara. The capital of Turkey, officially chosen as such in 1923, replacing Istanbul. It was rapidly transformed from an oriental hamlet in a malarial plain to a modern city with sanitary improvements and well laid-out streets. Railroads connecting with other parts of the country were constructed, electric power was provided, and manufacturing industries arose, notably for producing tiles and cotton and linen textiles. A park was laid out, and attractive government buildings were erected. Population, 1,236,152.

Baghdad. The capital of Iraq, situated on the Tigris River near the geographic center of the country. Like many other Oriental cities, Baghdad has a striking appearance at a distance. There are many ruined mosques, monuments of the city's former splendor. It was, in the 8th century, the capital of the caliphate of Haroun-al-Raschid, a hero of the *Arabian Nights*. Population, 2,969,000.

Bangkok. The capital and chief seaport of Thailand, on the Menam River 25 miles from the Gulf of Siam. It is noted for many elaborate temples and palaces. The streets, intersected by small canals, are made attractive with gardens and tall palm trees. The city's location on a far-reaching waterway system enables it to carry on an extensive foreign trade in rice, sugar, silk, peanuts, and cotton. Its modern airport, Don Muang, one of the largest in Southeast Asia, is served by 24 international airlines. Population, 3,967,081.

Beirut. Capital and principal seaport of Lebanon, also the seat of the American University and the Lebanese National Museum. Beirut has rail connections with Damascus and with Haifa and Tripoli. Population, about 700,000.

Benares. See *Varanasi*.

Bethlehem. A town of Jordan about five miles southwest of Jerusalem. Its chief center of interest is the basilica of Constantine, built in the 4th century at the spot where Jesus was believed to have been born. A chapel nearby commemorates Jerome, the maker of the Vulgate edition of the Bible, who resided and died in Bethlehem. Population, 22,453.

Bombay. The second largest city of India, situated on a small island near the center of the country's southwest coast. By reason of its industrial development and of its modern improvements, Bombay is the most European in appearance of the cities of India. It has one of the six federal universities of the country. The characteristic Oriental features remain, however, in much of the city, where decorated houses, tea shops, bazaars, and temples bear witness to the more ancient civilization of the Hindus. Bombay was the birthplace of Rudyard Kipling. Population 5,970,575.

Calcutta. The largest city and, until 1911, the capital of India, about 85 miles from the sea at the west of the enormous delta of the Ganges River. Calcutta is the terminus of many railroads and canals and handles about one-third of the entire foreign trade of India. The Euro-

pean section has numerous splendid buildings. Cotton mills, sugar refineries, sawmills, silk mills, flour mills, and shipbuilding yards are among the more important industrial establishments.

The city is the seat of the University of Calcutta, founded in 1857. Victoria Memorial, one of the finest buildings in Calcutta, contains documents and pictures illustrating Indian history. Thackeray, the novelist, was born in Calcutta. Population, 7,031,382.

Canton (Kwangchow). A commercial city of southeastern China, situated about 70 miles northwest of the island of Hong Kong. The city is one of the chief centers of the Chinese silk trade. The industries include the manufacture of paper, lacquered wares, textiles, and glass, and the painting of porcelain.

The city is surrounded by a brick wall and partitioned by a cross wall into the old town and the new town. The latter has many wide, paved streets, Canton being one of the most progressive cities of China. Among the pagodas is one covering an area of seven acres. There is a Mohammedan mosque dating from the 9th century. Population, 1,840,000.

Chinese Wall. The most gigantic defensive work in existence, consisting of a wall more than 1500 miles in length, which was begun by the rulers of China in the 3d century B. C. and received its last addition in the 16th century A. D. A part, now destroyed, began near the Gulf of Liaotung in northeast China. The wall follows a general western direction along the southern border of Mongolia. The average height is about 22 feet. The base is from 15 to 25 feet wide, narrowing to 12 feet at the top. Its course passes through valleys and over mountains irrespective of the difficulties of construction.

Colombo. The capital of Sri Lanka (Ceylon), situated on the eastern coast of the island. The city was founded by the Portuguese in 1517 and was named in honor of Columbus. The European section is well built and modern in appearance. Population, 510,947.

Damascus. The capital of the republic of Syria. It is one of the few very ancient cities of the Mediterranean region which have survived until the present day. It is situated in a fertile region 53 miles southeast of its port, Beirut, on the Mediterranean coast. At the time of the Crusades, Damascus produced a famous type of ornamented steel, which has given the name damascening to modern steel etching.

The city has been often destroyed and rebuilt. The Ommiad, the largest of the city's 200 mosques, was formerly a church, which had earlier replaced a temple said to have contained the head of John the Baptist. Damascus, on account of its beautiful surroundings, is believed to have been the model for the paradise described in the *Koran*. The city contains the burial place of Fatima, the only child of Mohammed. Population, 618,457

Dead Sea. A salt-water lake in Palestine. It is 47 miles long and 10 miles wide. Its area is 340 square miles and it has a maximum depth of 1280 feet. Lying 1290 feet below sea level, it is the lowest body of water on the surface of the earth. Its principal affluent is the Jordan river. It has no outlet, its excess water being taken off by evaporation, estimated at about 6,000,000 tons daily. The salinity of the Dead Sea is 23 to 27%, which is about 5 times that of the ocean. The economic value of the various salts in solution is very great.

Delhi (*dĕl'ē*). The capital of India, situated in the north central part of the country. Delhi was formerly the largest city of India. The Mogul emperors made it their capital, and erected many fine buildings, the ruins of which still attest their original grandeur. The Great Mosque, built in 1650, still stands, and is regarded by Mohammedans as one of the wonders of the world. In the vicinity of the city is the Kutb Minar, a tower 238 feet high built of stone, ranging in color from red at the bottom to orange at the top.

The transfer of the seat of government from Calcutta to Delhi in 1911 was the occasion for building a new division of the city, known as New Delhi. This centers about Raisina, a hill six miles south of the walls of old Delhi, with which it is connected by broad, tree-lined avenues. Over $150 million was spent on this city building project, which is the most magnificent the Orient has witnessed in modern times. Population, 3,647,023.

Hangchow (*hăng'chō'*). A city of mainland China near the center of the country's eastern coast and standing at the head of Hangchow bay, an inlet of the China Sea. The city is near the southern terminus of the Grand canal, which serves as an artery of the commerce centering in the city. The chief manufactures are silk and fans.

Hangchow is one of the best-built cities of China. The city is surrounded by a massive wall, 12 miles in circuit. The western part of this wall is washed by West lake, a beautiful sheet of water 8 miles in circumference dotted with islands on which are built monasteries, memorial halls, and shrines. To the west of the lake are numerous Buddhist temples. Population, about 784,000.

Hankow (*hăn'kō'*). See *Wuhan*.

Hiroshima. A large city near the southern end of the island of Honshu, Japan. It was an important political and commercial center having rail, air, and ocean connections. As a victim of the first atomic bomb, it was almost completely demolished but has been rebuilt. Population, 515,000.

Irkutsk (*ĭr-kōōtsk'*). A commercial city of south central Siberia, situated near the south end of Lake Baikal. It has a large caravan trade from Mongolia and is one of the three important points on the Asiatic section of the Trans-Siberian railroad. Articles of commerce include tea, silk, porcelain, dried fruit, fur, and fossil ivory. Population, 420,000.

Islamabad. The capital of Pakistan, situated in the north of West Pakistan 15 miles north of Rawalpindi. The latter was provisional capital until 1966 while the new governmental city of Islamabad was being built. Population, 235,000.

Izmir. See *Smyrna*.

Jakarta (Raya). The capital of the Republic of Indonesia, situated on the north coast of Java Island. It forms the chief outlet for the numerous products of the former Netherlands East Indies. The European section, in the higher, more healthful part, contains the Museum of the Batavian Society of Arts and Sciences, a beautiful structure in the Greek style which houses the largest collection of Javanese art in existence. The University of Indonesia is located here. Population, 4,600,000.

Jerusalem. The capital of Israel, as it had been of the ancient Israelites from about 1000 B.C. It is on an elevation of 2500 feet between the Mediterranean and Dead seas. About it has centered the devotion of Jews, Christians, and Mohammedans. It is the seat of Hebrew University.

The city is surrounded by ravines on three sides. The water and drainage facilities were greatly improved after the city was occupied by the British in 1918. The most prominent building of the city is the Mosque of Omar, standing on the site of Solomon's temple. The Church of the Holy Sepulchre and the Via Dolorosa are of interest for their connection with the crucifixion of Jesus. The "wailing wall," said to be a vestige of Solomon's temple, is sacred to Jews as a place for prayer and lamentation. Population, 344,200.

Kabul. The capital and largest city of Afghanistan It is near the center of the eastern frontier. Surrounded on three sides by mountains, it commands passes leading to India and Russia. Well built roads connect the city with these countries. The city itself is unattractive but it has a fine palace in a magnificent setting overlooking fruitful plains. It has also a small arms factory. Population, 289,703.

Karachi. A seaport in Pakistan, formerly the capital of the country. It is the chief outlet for wheat and raw cotton. Population, 2,721,200.

Keijo (Seoul). The capital and chief port of South Korea, situated near the center of the west coast of Chosen, of which it is the chief port and the capital. It is connected with the Trans-Siberian railroad. Silk, tobacco, mats, paper, and fans are made in the city. During the Korean war, it was the scene of bitter fighting and was partly ruined. Population, 3,800,000.

Kobe (*kō'bĕ*). A seaport of Japan, situated on the southern coast of Honshu Island. It is the chief center of Japan's silk export trade. Prominent among the industrial establishments is an imperial ship-building yard. Population, 1,228,000.

Kyoto (*kyō'tō*). An inland commercial and industrial city of Japan, situated near the southern coast of Honshu Island. Kyoto was formerly the capital of Japan and bears evidence of the fact in the regularity of its plan and in its magnificent monuments and temples. Its industries include the manufacture of porcelain, brocade, toys, metal products, and silk fabrics. The city is the seat of an imperial university. Population, 1,379,000.

Lhasa (*lās'ä*). The sacred city of the Lamaists, members of a widespread, ascetic sect of Buddhism. The city is situated in south central Tibet on a plateau having an altitude of 11,830 feet. Being forbidden to the uninitiated, Lhasa was seen by no more than three Europeans before 1904, when the British forced an entrance. Just outside the city stands the imposing former residence of the head of the religious sect, the Dalai Lama. The Chinese took over the city in 1958, destroying the monastic institutions, and the Dalai Lama escaped to India the next year.

Madras. One of the largest cities of India, situated on the southeastern coast of the country. The industrial output

includes textiles, cigars, iron, cement, and dyes. The city contains an ornamental park, many fine buildings and monuments, an observatory, museums, a university, and a number of colleges. Population, 3,169,930.

Malay Archipelago. The largest group of islands in the world, lying at the extreme southeastern corner of Asia. The principal islands are Sumatra, Java, Borneo, Celebes, and the Philippine group. Of these, Sumatra, Java, and Borneo are on a continental shelf less than 600 feet deep, which connects with the Philippines by two submarine banks; the others are surrounded by water of great depth. Nearly all the islands present bold profiles and have mountains which are actively volcanic.

The equator passes through the center of the group. A rich soil and the warm, moist climate combine to make these islands extraordinarily fertile. They abound in tropical fruits of many kinds. Among the cultivated crops are rubber, rice, tea, sugar, coffee, kapok, cinchona bark, and coconuts. The mineral wealth of the islands is important, including tin in Banka and other islands near Sumatra, petroleum in Sumatra, coal in Borneo and Sumatra, and lead in all the larger islands. The inhabitants are largely Malaysians. Chinese tradesmen are numerous. The total area of the archipelago is estimated at 1,094,857 square miles, supporting a population of over 60 million.

Mandalay. A city of central Burma, standing on the Irrawaddy River. There are a number of Buddhistic shrines, the most remarkable of which is the Kuthodaw, a square surrounded by 450 pagodas. Within each pagoda is inscribed a part of the Buddhist scriptures, the aggregate of the inscriptions constituting the whole of the sacred writings. A walled section of the city encloses Fort Dufferin, formerly a royal palace. Population, 1968 est., 195,348.

Manila. The former capital and chief city of the Philippines, on the west coast of the island of Luzon. It is built on both banks of the Pasig River at its entrance to Manila Bay. On the south side of the river is the ancient Spanish town, surrounded by a wall, with the cathedral, monastic buildings, and numerous quaint Spanish houses; also the principal residential section, hospitals, and government buildings. On the north side is Binondo, containing the principal shopping and financial district. Manila is important for its foreign and coastwise commerce. It is the world's greatest shipping market for hemp. The Spanish city of Manila was founded in 1571. In 1898, Admiral Dewey destroyed a Spanish fleet in Manila Bay. Population, 1,402,000; Greater Manila, 3,100,000.

Mecca. The most sacred city of the Mohammedans, situated in a barren valley in the southern part of the Saudi Arabia, of which kingdom it is one of the two capitals. It is about 50 miles inland from Jidda, its port on the Red Sea. Most of the inhabitants find support from lodging the pilgrims who, in numbers exceeding 100,000 annually, flock here from all parts of the Mohammedan world to visit the Sacred Mosque, which marks the birthplace of Mohammed. Population, about 185,000.

Medina. An inland city of central Hejaz, sacred to the adherents of Mohammedanism. Mohammed's flight there from Mecca in 622 A. D. marks the year in which the Mohammedan calendar begins. The prophet died in Medina, and a large mausoleum, said to contain his undecayed body, attracts numerous pilgrims. Population, about 72,000.

Mukden. See *Shenyang.*

Nagasaki. An old and large Japanese port of just over 420,000 people. It is important in both trade and industry with steel work and shipbuilding predominant. It is located on the extreme west of the southernmost Japanese island of Kyushi and was the second target of the atomic bomb.

Nagoya. The fourth largest city of Japan, 235 miles southwest of Tokyo. It is one of the greatest centers of Japanese pottery manufacture. Other industries include cotton and silk mills. Many people are engaged in the embroidering of handkerchiefs. Nagoya has a very fine Buddhist temple and a castle dating back to 1610. Population, 1,954,000.

Nanking. The former capital of China. It is about midway between Peking in the north and Canton in the south and lies on the south bank of the Yangtze River 235 miles from the sea. The first sovereign of the Ming dynasty chose it as his capital in 1368. From 1403 until 1928, the Chinese government had its seat at Peking, but returned in the latter year to Nanking. Most of the magnificent buildings of earlier days were destroyed in the Taiping rebellion in 1853. The Republican government in 1928 proceeded to modernize the city. A boulevard has replaced the ancient city wall. On Purple mountain near by, a magnificent monument was erected to Sun Yat Sen, founder of the Chinese republic. Population 1,419,000.

Nazareth. A town of northwestern Israel, about 20 miles from the Mediterranean seacoast. It is memorable among Christians as the early residence of Jesus. A richly decorated basilica, the Church of the Annunciation, stands on what is said to be the site of the residence of Mary, the mother of Jesus, her house allegedly having been miraculously transported to Loreto, Italy. The town was captured from the Turks by Australians in 1918. Population, 26,400.

New Delhi. See *Delhi.*

Omsk. A city of southwestern Siberia on the Trans-Siberian railroad. It is a noted trading center for wheat and for dairy products. Manufactures include agricultural machinery, cloth, and sausages. Population, 774,000.

Osaka (*ō'zä'kä*). The second largest city of Japan, situated on Osaka Bay in the southern part of the island of Honshu. Being intersected by the Yodo River and by numerous canals spanned by hundreds of bridges, the city has been styled the Venice of the East. Ironworks, cotton and sugar mills, shipyards, and a large government mint are among the more important industries. The city is regularly laid out and contains many notable temples. Population, 3,133,000.

Pacific Islands or **Oceania.** Under these terms are included the numerous islands of the Pacific Ocean east of the Malay archipelago and north and east of Australia. On racial grounds they are frequently divided into three groups —Polynesia, Melanesia, and Micronesia. Melanesia lies directly north and east of Australia and west of the international date line. It includes the Solomon, Santa Cruz, New Hebrides, New Caledonia, and Fiji islands. North of this group lies Micronesia, comprising the Caroline, Marshall, Gilbert, Guam, Nauru, and neighboring islands. Polynesia includes most other islands of the Pacific Ocean east of the groups described above. Among the more important are the Hawaiian, New Zealand, Friendly (Tonga), Society, Cook, Samoan, Marquesas, Manahiki, and Union islands.

Peking. The capital of Communist China. It is located about 80 miles west of the Gulf of Chihli, an inlet of the Yellow Sea. Peking consists of an old city and a new city, usually called the outer city and the inner city. Each is surrounded by a wall, which, in one section, separates the two cities. The new city is larger and more populous. The old city contains a walled imperial city, within which lies the "purple forbidden city," the former palace and court of the emperor. These divisions are now traversed by a broad thoroughfare which passes through Peking from north to south. The finest building in the old city is the famous Temple of Heaven. To the west of the city, on the so-called Mountain of Ten Thousand Ancients, stands the emperor's summer palace, near which, upon a lagoon, floats a marble boat, built as a pleasure house. The grounds contain the celebrated camel back bridge, and near by is a pagoda built of porcelain.

Peking is a great educational center. It is the seat of Yenching University, established by American philanthropy, a number of technical and professional schools, and the oldest observatory in the world. Population, 4,010,000.

Pichola. A small lake near Udaipur in central west India. Each of two small islands in the lake is enclosed by marble walls, within which is erected a marble palace. These marble palaces were built by rulers of Rajputana and exhibit a grace and elegance which are equaled in very few of the great buildings of the world.

Rangoon. The capital and leading port of Burma, located on the southern coast near the Gulf of Martaban. The chief industrial establishments include lumber, rice, and oil mills, the products of which are exported in large quantities. Rangoon has a Buddhist pagoda, 370 feet high and covered with gold leaf, the foundation of which is said to have been laid in 588 B. C. This pagoda, called the Shoay Dagon, contains objects sacred to Buddhists and is annually visited by thousands of pilgrims. A university is situated in the city. Population, 3,662,312.

Rawalpindi. See *Islamabad.*

Samarkand. A historic city in the former Uzbek Republic, USSR. Its ancient name was Maracanda. It was destroyed by Alexander the Great in 329 B.C. After its capture by the Moslems in 911-12 A.D., it became a brilliant seat of Arabic civilization. Jenghis Khan destroyed it in 1221. Timur made it his capital in 1369. The palace and tomb of Timur are among the finest of the city's buildings. The Rigistan square is surrounded by four ancient structures, formerly Moslem colleges. The modern part of the city has broad, shaded streets. Its industries include cotton ginning and the manufacture of leather, flour, brick, pencils, and liquor. Population, 233,000.

Seoul. See *Keijo.*

Shanghai. The largest city, principal port, and chief industrial center of Communist China. It lies at the junction of the Huang River and Soochow creek 12 miles from their mouth in the estuary of the Yangtze River. It is the sea gate for the trade of the richest portion of China and is the spearpoint of its advancing industrialization. Flour and rice milling, shipbuilding, publishing, and the manufacture of engines, machinery, cotton and silk textiles, paper, cigarettes, leather, and food products are the leading industries.

A portion of the city is modern and well built, having grown up entirely since 1854. In 1932 Japan captured a part of the city and held it for a short time. Population, 10,820,000 (est.).

Shenyang (Mukden). A city of Communist China, located about 150 miles north of the Yellow Sea. It is a railroad junction and a point of convergence of several caravan routes. Near the city are the tombs of the Manchu emperors, who, in the 17th century, made Mukden their capital. Huge stone elephants stand on guard over the tombs. Near Shenyang was fought the decisive battle of the Russo-Japanese war. Population (Western est., 1965) 4 million.

Singapore. City and member country of the British Commonwealth, situated on an island at the southern tip of the Malay Peninsula. It is the smelting point for the immense amount of tin mined in adjoining Malaysia and ships a major part of the world's block tin. A strong British naval station is maintained there by agreement with the Singapore government. About two-thirds of the estimated 2,278,200 inhabitants are Chinese. See *Malaysia*.

Smyrna (Izmir). A seaport and commercial city of west central Turkey, standing at the head of the Gulf of Izmir, an inlet of the Ægean Sea. The rugs for which Smyrna is famous are made, for the most part, in the surrounding towns. Other articles of trade are silks, cottons, olive oil, gums, and figs. Smyrna is one of the oldest continuously inhabited cities in the world. It was assigned to the Greeks as a mandate in 1920. In 1922 the Greeks were driven out, and the city was put to flames. Population, 1,660,529.

Srinagar (*srē'nä-gŭr'*). The capital of the native kingdoms of Jammu and Kashmir in the northern extremity of India. In the picturesque scenery of the surrounding country was located the "Vale of Cashmere," celebrated in Moore's poem entitled *Lalla Rookh*. Population, 403,612.

Tai Shan. A sacred mountain about 120 miles southwest of the Gulf of Chihli, an inlet of the Yellow Sea. On its summit are several temples, beneath one of which Confucius is said to have been buried. Each year during February and March as many as 10,000 pilgrims in a single day ascend to the summit, 4700 feet in height. The ascent is facilitated by a six-mile mountain road, paved and provided with steps in the more precipitous stages.

Tashkent. A city of southern Russia, capital of the Uzbek Republic. It is situated in a vast surrounding plain of arid land on which cotton is grown with the aid of irrigation. Its industrial interests include cotton ginning and lumber mills and tobacco, leather, machinery, and rayon factories. The city has up-to-date water, electric, and street railway systems. Population, 1,643,000.

Tbilisi (Tiflis). The capital and largest city of the Georgian Republic, in the Soviet Union, situated midway between the Black Sea and the Caspian Sea. It is the distributing center for the country and has manufactures of bricks, tobacco, leather, soap, flour, cotton, and furniture. In picturesque contrast to its many wide streets and modern water, electric, and transport services are the Oriental bazaars and markets, where merchants from the East display their silverware, swords, rugs, dried fruits, and silk goods. It was founded as Tiflis in A.D. 379. Russia obtained it in 1799. Population, 1,030,000.

Tehran (*tĕ-h'răn'*). The capital of Iran, lying on an elevated plain in the north central part of the country about 66 miles south of the Caspian Sea. Manufactures include rugs, silks, cotton goods, and ironware. It has a citadel, called the Ark, within which is the handsome palace of the shah. The principal street is the Boulevard des Ambassadeurs, running through the foreign section. Tehran was founded in the 12th century and became capital of Persia (now Iran) in 1788. Population, 3,150,000.

Tel Aviv. Mediterranean port of Israel, forming, with Jaffa, a joint municipality having a combined population of 389,700. It grew rapidly after World War II with the influx of displaced European Jews.

Tientsin. A commercial city and port of Communist China on the Pei River about 70 miles from its mouth in the Gulf of Chihli. It is 70 miles southeast of Peiping. The waterfront has buildings resembling the commercial structures of Western cities. The remainder of the city, which lies on a low plain, has small buildings and narrow, ill-kept streets, although municipal services have been much improved since 1900, when the city walls were destroyed in the Boxer uprising. Tientsin has an immense trade in salt, rice, and tea. Population, 4,280,000, estimated.

Tokyo. The capital of Japan and largest city in Asia. It stands at the head of Tokyo Bay near the center of the eastern coast of Honshu Island.

The city was largely destroyed in 1923 by earthquake and fire, which laid waste 25 square miles. This catastrophe provided the opportunity for rebuilding according to modern plans. The streets were widened, at the cost of moving some 200,000 houses; sewers were installed; public school playgrounds were enlarged; and a subway for rapid transit was constructed. Buildings in general are low or made of reinforced concrete to minimize danger of damage from earthquakes. The Hall of the Nameless Dead commemorates 33,000 victims of the great fire of 1923.

The chief of the city's many parks is called Tukiage, which contains the palace of the emperor built in a mixed Japanese and European style of architecture. The University of Tokyo is an institution of higher learning of the most advanced type. The eastern portion of the city contains regions known to visitors for their display of flowers.

The site of the city was a fishing village in the 13th century. It first became important in 1457 as the residence of the feudal lord. The name was changed in 1868 from Yedo to Tokyo, meaning Eastern Capital. Population, 8,643,000.

Trans-Siberian Railroad. A railroad which traverses Russia in an east-west direction, connecting Leningrad in Europe with Vladivostok on the extreme edge of Asiatic Russia. Over 5,500 miles in length, it occupied 11 years for initial construction, which cost $172 million. It was practically completed by 1902.

At a point east of Lake Baykal the road was divided, finally meeting at a point near Vladivostok. One line passed east of Lake Baykal entirely in Russian territory. The other line, passing through Manchuria, was known as the Chinese Eastern Railway and was owned jointly with China. In 1931 it was seized by Manchuria, and a small indemnity was paid to Russia.

The railroad is now double tracked. With feeders and connections running to southern Russia, it has been the central factor in one of the greatest migrations of people in history—settlement of the Siberian plains. Strategically, it makes eastern and western Russia a unit.

Varanasi (Benares). A city of north central India on the Ganges River. It is sacred to the Hindus, who come from all parts of India to wash away their sins in the Ganges. There are more than 1500 temples in the city, which abounds in beggars. The river banks are lined with stone and have many landing places, often highly ornamented. The city is a center of trade. Gold brocades, gold and silver thread, brassware, and lacquered toys are manufactured. The Benares Hindu university is situated there. Population, 582,915.

Victoria. The capital of the British island of Hong Kong by which name it is usually called. Victoria is a free port and the center of British commerce with China and Japan. The British fleet used the island as a naval base in the first Opium war, 1839-42. Then practically uninhabited, it was ceded to Great Britain in 1841.

Its numerous industries include the manufacture of ships, cement, paper, rope, glass, soap, cigars, and knitted goods. Population of Victoria, 633,138; of Hong Kong island and adjacent leased territory, 3,927,000.

Vladivostok (*vlă'dĭ-vŏs-tŏk'*). The chief Pacific Ocean port of Russia and the eastern terminus of the Trans-Siberian railroad. The city is situated in the extreme southeastern part of Asiatic Russia, in the vicinity of valuable iron deposits. The chief products handled are the numerous derivatives of the soy bean. Vladivostok was settled in 1860, two years after its site was acquired by Russia. Population, 526,000.

Wuhan. A city of China, standing at the head of ocean navigation on the Yangtze River about 680 miles from its mouth in the East China Sea. Under the Communist government, this city was formed by the amalgamation of the former Hankow with the neighboring cities of Wuchang and Hanyang. The city contains large iron and steel works, which utilize the extensive iron and coal deposits in the vicinity. Cotton goods, flour, and leather are also manufactured. The chief exports of the city are normally black tea, wood oil, and sesame seed. Population, 2,411,000.

Yokohama. A leading seaport of Japan, situated on Tokyo Bay near the center of the western coast of Honshu Island. The chief exports are silk and tea. Yokohama was the first Japanese port open to foreigners and it is still the headquarters for most tourists who visit Japan. The city was almost totally destroyed in 1923 by earthquake and fire. It was reconstructed with wide streets, concrete buildings, and bridges. Population, 2,622,000.

AFRICA

THE second largest continent of the world, situated in the eastern hemisphere south of Europe and southwest of Asia, with which it is connected by the Isthmus of Suez. It is separated from Europe by the Mediterranean Sea, an inland body of water which narrows to a width of nine miles at the Strait of Gibraltar. Between Africa and Asia, lie the Red Sea and the Gulf of Aden. The Atlantic Ocean on the west and the Indian Ocean on the east meet at the southern point of the continent.

Africa lies farther to the north than South America. In length, the continent is almost equally divided between the northern and the southern hemisphere. On account of its shape, however, about two-thirds of Africa's surface lies north of the equator. Its most northern point is in the latitude of Washington, D. C., and it extends nearly 5000 miles south to the approximate latitude of Buenos Aires. It has an area of about 11,500,000 square miles, being about 1⅓ times as large as North America and second only to Asia in extent.

Outline. As in the case of South America, the maximum width of the continent is in the north. By reason of a huge western extension, Africa attains a width of 4600 miles, just 400 miles less than its length. Between the western extension and the southern portion of the continent, lies the Gulf of Guinea. The only other major indentation is the Gulf of Sidra near the center of the northern coast. On the eastern coast, the Somali Republic projects as a cape, separating the Gulf of Aden from the Indian Ocean. The coast line is remarkably regular and, consequently, affords very few good harbors.

Surface. Africa is, for the most part, a plateau surrounded by a very narrow strip of coastal lowlands. The southern and the eastern parts of the plateau are higher than the western and the northern parts. The latter contain certain sections, in the interior of the Sahara desert, where the elevation is that of the sea level or even less.

In the extreme southern part of the continent, a ridge rims the plateau, rising, on the eastern side, to a height of nearly 9000 feet. The east central part of the continent consists of a wide, irregular highland cut longitudinally by the so-called Great Rift valley, which contains lakes rivaling in size the Great Lakes of North America. Lake Victoria is the largest, being second only to Lake Superior in area. Lake Tanganyika, farther south, is the longest lake in the world, having a length of 400 miles. Lake Nyasa, the most southern of the group, has the extraordinary depth of 2580 feet. In this region are to be found also the highest mountains of the continent, usually rising abruptly from the surface of the plateau. Mount Kilimanjaro, situated about 200 miles south of the equator and 200 miles from the east coast, reaches an altitude of 19,710 feet. Mount Kenya and Margherita mountain are other notable peaks of the district. Continuing northward, the highland narrows to form the lofty, mountainous region of Ethiopia. An elevated ridge skirts the Red Sea as far as the Isthmus of Suez.

The mean level of the northern and the western parts of Africa is below 2000 feet. Isolated mountain ridges, however, occur in various parts. The highest is the Atlas range at the extreme northwest, running parallel with the coast and attaining to an altitude of 14,000 feet.

Drainage. The absence in Africa of a pronounced continental divide has had the effect of producing two kinds of rivers. Those on the outer slopes of the continental plateau are short and rapid, while those rising in the interior follow a long, winding, inland course. Then, penetrating the mountain rim, they make their way over cataracts and through narrow channels to the sea, where a sand bar is often formed by sediment carried down the stream.

The four largest rivers of Africa are the Nile, the Congo, the Niger, and the Zambezi. The basins of inland drainage, which occupy more than three million square miles in northern Africa, are usually too arid to give rise to large bodies of water. There is a notable exception, however, in the case of Lake Chad.

The Nile is, next to the Mississippi-Missouri, the longest river of the world. Rising in a stream that flows into Lake Victoria, it wends its way northward, and, after passing over six cataracts and traversing a distance of 4000 miles, it empties through a large delta by seven mouths into the Mediterranean Sea. Its lower course lies through the desert region of Egypt, a strip of which it renders productive by means of its annual flood. The river is navigable about 590 miles above its delta to the foot of the first cataract at Aswan and, with interruptions, for a distance of 1550 miles farther toward the source.

The Congo River is the second river of the world in volume of water discharged and in the area of its basin. By means of numerous tributaries, of which the Ubangi is the largest, the Congo drains a tropical basin of central Africa in a general westward direction and discharges its waters into the Atlantic Ocean through a mouth ten miles in width. The river admits of navigation, with some interruptions, for a distance of 2000 miles above its mouth.

The Niger River offers greater facilities for navigation than any other river of Africa. It drains a comparatively low plain in Africa's westward extension. Rising within a few hundred miles of the Atlantic coast, it flows inland toward the northeast, then, bending southeast, it follows a meandering course to an immense delta on the Gulf of Guinea.

The Zambezi River rises on a ridge near the west coast of southern Africa, and flows eastward across the continent to Mozambique channel. Near the middle of its course, it plunges over Victoria Falls, the greatest cataract in the world. Here, over a width of a mile, the river drops 343 feet.

Lake Chad, situated about 850 miles northeast of the head of the Gulf of Guinea, has no outlet. During the rainy season, it occupies an area of about 40,000 square miles, but it diminishes during the dry season to one-sixth of this area.

Climate. Africa extends almost equal distances north and south of the equator. It is, therefore, subject to a smaller variation in temperature than any other large division of land. At the extreme north and at the extreme south, there are belts of temperate or subtropical climate. Between these limits the heat is greater.

The rainfall is greatest in the basin of the Congo. On each side of this equatorial belt of abundant and well distributed rainfall, stretches a zone in which the rainfall is seasonal, a short, wet season being followed by a long, dry one. These two zones pass gradually into the two great desert areas of the continent, Kalahari desert in southern Africa and the Sahara desert in the north. Beyond these arid regions, in the extreme north and in the extreme south of Africa, there are narrow coastal lowlands having a moderate, or even a copious, rainfall.

The Sahara Desert is the largest continuous arid region of the world. Its area, about 3,500,000 square miles, is larger than that of the United States. It occupies all that part of northern Africa from the Atlas mountains on the northwest to the midcourse of the Nile river on the southeast. The small amount of rain which does fall occurs in one season only and, as a rule, sinks immediately into the sand to issue here and there as springs. These springs foster islets of vegetation, known as oases, which are estimated to cover one-fortieth of the desert's surface.

Vegetation. The plant life of Africa varies in a manner determined mainly by the rainfall. The

extreme northern section has a flora resembling that of Europe. The forests in this part consist largely of oaks, while the olive, vine, fig, and the cereals of Europe thrive. The extreme southern region, being comparatively isolated, has a characteristic vegetation marked by the prevalence of heaths and of other plants producing brilliant flowers. Forests are scarce, but there is abundant pasturage for sheep.

The equatorial belt, except in the eastern highlands, is covered with dense tropical forests. These forests contain an immense variety of trees, including the wine palm, the oil palm, the silk-cotton tree, and the camwood, besides ebony, mahogany, and many other valuable cabinet wood trees.

Animals. Africa is the home of many distinctive types of animals, including a number of large mammals. The giraffe, okapi, hippopotamus, gorilla, and chimpanzee are among the more notable of African mammals which occur nowhere else. Lions, leopards, two-horned rhinoceroses, zebras, antelopes, and African buffaloes are representative of the large animals which attract hunters. The conservation of such animals was, in 1900, made the subject of an international conference, as a result of which game preserve areas were established in British Africa, Somaliland, and other countries. The African elephant is hunted for its ivory tusks, which for centuries have been brought from the interior of Africa by caravans.

The ostrich is found in the drier regions. Other birds are the maribou stork, the secretary bird, and the parrot. Crocodiles are found in the large rivers and tropical lakes. Insects include the formidable white ant and the deadly tsetse fly.

A European type of fauna characterizes the extreme north, where the bear, the jackal, and the fox are found. The wild ass of east central Africa is said to be the ancestor of the domesticated ass. Camels were introduced very early into the northern desert regions from Asia. In Egypt, the inhabitants anciently regarded as sacred the ibis, the crocodile, and the cat.

Minerals. Africa produces nearly all of the world's supply of diamonds and more than one-third of the world's yearly output of gold. South Africa is the region most productive of both minerals, although gold is also obtained from the Gulf of Guinea region and elsewhere. Some of the richest copper deposits in the world exist west of the great interior lakes, and iron has from the earliest times been worked by the natives. Salt is abundant. Oil is found in the Sahara and elsewhere.

Inhabitants. Although the city civilization of northeastern Africa is probably the world's earliest, the rest of the continent continued as a pastoral and agricultural society organized on a tribal basis until the 20th century. The aborigines of most of the continent are negroid and are believed to have remained relatively immune from foreign conquest because Africa's rivers did not afford ready navigation into the interior. Arabs established themselves on the northern and northeastern regions in the 7th century; the Dutch settled in the south in the 17th century; and the French infiltrated the Mediterranean coast in the 19th century, followed by colonization of most of the continent by Britain, Belgium, Italy, and other European nations. By the middle of the 20th century the colonial empires were almost entirely liquidated.

The Pygmies of the equatorial forests and the Bushmen of the southern arid districts are believed to represent the earliest African races extant. They live by hunting; their dwellings are of the most primitive type. The Hottentots stand, in culture, as in location, between the Bushmen and the Bantus. The Bantus constitute the southern half of a negroid race which inhabits most of Africa from the region of the great lakes northward to the Sahara Desert.

The native Africans speak a language belonging to a family known as Bantu. One branch, spoken chiefly in the east, is Swahili. It has obtained a wide currency as a trade language.

The total population of the continent is estimated at 336 million. It is estimated that less than half the population has been affected by religions of foreign origin. Of this proportion by far the most are Mohammedans.

Discovery. The valley of the Nile river was the seat of what is perhaps the world's earliest civilization. The interior of the continent, however, remained unknown until the 19th century.

As early as the 7th or 6th century B. C. a Phœnician ship sailed around Africa. The possibility of circumnavigation, however, was forgotten until 1486, when the Cape of Good Hope was rounded by Diaz.

Numerous early attempts were made to penetrate the interior of Africa. The first European to cross Africa from ocean to ocean was David Livingstone, who completed the journey in 1856.

POLITICAL DIVISIONS

The last quarter of the 19th century witnessed the partition of Africa into protectorates and colonies of various nations of Europe. By 1976, practically all these colonies had become independent nations, leaving a small residue as dependencies.

Algeria. A republic of northern Africa stretching 640 miles east and west along the Mediterranean Sea between Libya and Tunisia on the east and Morocco on the west and extending south about 340 miles. Its area is 113,883 square miles.

Algeria is divided longitudinally by the Atlas mountains, north of which lies a fertile well-watered plain 50 to 100 miles wide. The rest of the arable land is dry and is productive only with the aid of irrigation. Crops raised include wheat, barley, oats, corn, tobacco, dates, oranges, figs, and grapes, from which wine is made in large quantities. Wool is a leading product of Algeria's agriculture, which is particularly rich in farm animals, including camels.

The population in 1968 was 12,934,000. The capital is Algiers. Other leading cities are Oran, Constantine, and Bone.

Angola. Formerly Portuguese West Africa, Angola has a 1000-mile coastline along the Atlantic and is bounded by Zaire on the north and east, by Zambia on the east, and South West Africa (Namibia) on the south. Its area is 481,351 square miles. Most of Angola's land is desert and plains, although in the northeast there are heavily forested valleys that provide the main exports—diamonds and hardwoods. Along the coast palm trees are grown for their oil and kernels. Angola's population is 5,673,046 (1970)—of whom 475,328 live in Luanda, the capital and largest city.

Benin (Dahomey). A republic of central western Africa, Benin consists of a narrow strip 77 miles wide and 415 miles long. With its southern boundary on the Gulf of Guinea, it is bounded on the west by Togo, on the north by Niger and Upper Volta, and on the east by Nigeria. Benin's 44,290 square miles are devoted mainly to animal industry and agriculture; the chief products are corn, manioc, and yams. Benin's capital is Porto Novo (population: 2,571,000). The nation is a member of the French Community.

Botswana. A land-locked republic of southern Africa. Botswana is bounded by South West Africa (Namibia) on the north and west, Zambia and Rhodesia on the east, and South Africa on the south and southeast. Its area is 222,000 square miles. Most of the country is a tableland with the Kalahari desert in the southwest. In the northwest the Okavango river forms a great inland delta and the swamplands of the river cover 6500 square miles. The Orapa diamond mine in the south contains one of the largest gem deposits ever found. Agriculture and animal raising account for almost half of the national income, but there are also rich deposits of manganese, copper, nickel, coal, and salt. The population was 656,737 in 1973. Gaborone is the nation's capital. Botswana is a member of the British Commonwealth.

Burundi. A republic of east central Africa, 10,744 square miles in area, bounded north by Rwanda, east and south by Tanzania, and west by Congo. Coffee is the principal crop. The capital is Bujumbura. Population, about 3,406,000.

Cameroon. A republic of West Africa, whose west coast lies on the Gulf of Guinea. It is bounded north by Nigeria and Chad, east by the Central African Empire, and south by Congo (Brazzaville), Gabon, and Equatorial Guinea. The republic, 181,476 square miles in area, is a federation of a former French dependency, which was given independence in 1960, and the southern part of a former British dependency, which voted in 1961 to join the Cameroon republic.

The population is made up of about 200 tribes, which support themselves by agriculture and husbandry. There is normally an exportable surplus of cocoa, coffee, rubber, bananas, cotton, palm oil, and timber. Most of the trade is with France and Britain. The capital is Yaounde. Population, about 5,562,000.

Central African Empire. A land-locked country at approximately the geographical center of Africa, bounded north by Chad, east by Sudan, south by Congo and Zaire, and west by Cameroon. Its 238,000 square miles form a rolling plain about 2000 feet in altitude draining southward toward the Congo basin and thence into the Atlantic Ocean. It lies about 300 miles inland from the Gulf of Guinea.

The population of about 1,488,000 is organized on a tribal basis. Cotton, coffee, and peanuts are raised in exportable quantities, and meat is imported. The capital is Bangui. It was formerly part of a French dependency.

Chad. A land-locked republic of north central Africa, 495,000 square miles in area, bounded north by Libya, east by Sudan, south by Central African Empire, and west by Cameroon and Niger. The northern part of the country is a sandy desert, but agriculture, featured by cotton raising and animal husbandry, is carried on in the central steppe land and a southern grassland with scattered trees. The population of about 4,000,000 has a large element professing the Moslem faith. The capital is N'djamena. It is a member of the French Community.

Comoro Islands. A former French dependency, the islands lie off the eastern coast of Africa about 300 miles northwest of Malagasy. The nation is an archipelago of four islands—Mayotte, Anjouan, Grande Comore, and Moheli. The total area is 838 square miles. The islands are of volcanic origin and are extremely mountainous. The highest peak is Mt. Karatab at 7900 feet. Grande Comore island is heavily forested and the timber is used for building. Although there is fishing and animal raising, the country is largely agricultural. The main crops are vanilla, copra, cacao, sisal, coffee, and cloves. The capital is Moroni, on Grande Comore island, and the population of the Comoro Islands is about 300,000.

Congo. The country has about 60 miles of coast on the Atlantic Ocean and stretches some 800 miles northeast with a maximum width of about 400 miles. It is bounded west by Gabon and Cameroon, north by Central African Empire, and east by Zaire, from which it is separated in part by the Congo River.

More than half its 139,000 square miles is covered by forest, from which considerable timber is exported. Other products are palm oil and peanuts. Gold and lead are mined. The chief port, Pointe Noire, as well as the capital, Brazzaville, have modern airports. Population, about 870,000.

Egypt. An Arab republic, situated in the extreme northeast of Africa. Its area is about 386,198 square miles, most of which is arid and unproductive. The population, numbering some 32 million, is almost entirely concentrated in the fertile valley of the Nile River, and is devoted principally to agriculture. The area of the cultivated region is about 13,600 square miles, which includes not only the Nile valley but the delta and oases in the desert. Much of this area has been reclaimed by irrigation.

The chief crop is cotton. The papyrus plant of Egypt was used in the making of paper more than 4000 years ago. Today, however, Egypt imports practically all her paper.

The productivity of the Nile River valley is due to the annual flooding of the river banks in September and October. The area of cultivation has been greatly extended by the construction of irrigation works, consisting of canals, of several barrages, and of the great Aswan and Sennar dams, each over a mile in length, which now regulate the flow of water.

The Nile proper which flows through Egypt is formed by the junction of the Blue Nile and the White Nile at Khartoum in the Sudan. The Blue Nile rises in the mountains of Ethiopia, the White Nile in Uganda. It descends by a series of six cataracts or rapids, and, after flowing through the Nile delta, empties into the Mediterranean by two main channels, one near Alexandria, the other near Port Said. The Nile is one of the world's longest rivers.

Southern Egypt has a dry, healthful climate, which makes it desirable as a resort for tourists. A further attraction is found in the pyramids, the sphinx, various tombs, and other remains of the ancient civilization of the Nile. The northeastern extremity of the country has one of the world's two most celebrated ship canals, the Suez, which connects the Mediterranean Sea with the Red Sea.

Equatorial Guinea. This former Spanish dependency of western Africa consists of Rio Muni on the mainland. It is bounded by Cameroon on the north, Gabon on the east and south, and the Atlantic Ocean on the west. The offshore islands of Marcias Nguema and Pigalu in the Gulf of Guinea are added territories of Equatorial Guinea. The total area is 9,828 square miles. Rio Muni is characterized by a coastal plain and further inland the foothills of the Crystal Mountains. There are 2 volcanos on Marcias Nguema. The country depends greatly on agriculture as there are few industries. The main crops are cocoa, coffee, and wood. Uranium deposits have been found but they have not yet been developed. The capital is Malabo and the population is about 307,500.

Ethiopia. A country of northeast Africa with a northeast coast line on the Red Sea. It is bounded east by French Somaliland and Somali Republic, south by Somali Republic and Kenya, and west by Sudan.

Its area is about 350,000 square miles and is the most mountainous country of Africa. Most of the surface is covered by the Highlands of Ethiopia which reached their greatest height in Ras Dashan, 15,160 feet. The country is naturally rich with fertile soil and abundant rainfall. The climate is cool and bracing because of the high elevation. The chief rivers of Ethiopia, the Blue Nile and Atbara are tributary to the Nile and mainly responsible for its floods. The population is estimated at nearly 24 million.

The commercial products include hides, cattle, and coffee. Musk from the civet is used in perfumes. Gold is washed in the beds of the Atbara and its tributaries. Addis Ababa is the capital.

Gabon. A republic of equatorial Africa with 500 miles of western coast line on the Gulf of Guinea. It is bounded north by Cameroon, and east and south by Congo (Brazzaville). Most of its 102,290 square miles are covered with forest. Its products include timber, plywood, and veneer. Exploitation of its rich mineral resources has raised the economy of Gabon. Gabon, with a population of about 480,000, is a member of the French Community. The capital is Libreville.

Gambia. A republic of west Africa on the Atlantic Ocean and otherwise surrounded by Senegal. Its area is 4005 square miles; its population 494,279. Peanuts, rice, and palm kernels are the chief products. Banjul is the capital.

Ghana. A republic of western Africa with a southern coast line on the Gulf of Guinea. It is bounded west by Ivory Coast and Upper Volta, north by Upper Volta, and east by Togo.

About one-third of Ghana's 92,100 square miles is forested, from which comes such valuable timber as mahogany and other tropical woods. The rest of the country is devoted to agriculture. Ghana is the world's largest exporter of cocoa, the production of which is Ghana's major industry. Diamonds, bauxite, and manganese are Ghana's most important mineral exports. The Volta Dam, 370 feet high, was completed in 1966. It backs up the Volta River 300 miles to form Lake Volta, 3500 square miles in area. The hydroelectric plant generates nearly a million kilowatts of electricity.

The capital, Accra, is the seat of a research institute supported by Ghana and some of its neighboring republics, whose purpose is to discover the best methods of land use and disease control. Ghana is a member of the British Commonwealth. Population, 8,545,561.

Guinea. A republic of Africa with a western coast line on the Atlantic Ocean. It is bounded north by Guinea-Bissau, Senegal, and Mali, east by Ivory Coast, and south by Liberia and Sierra Leone.

Most of Guinea's area of 96,865 square miles is devoted to agriculture and animal husbandry. Agricultural products include rice, cassava, bananas, palm nuts, coffee, pineapples, and oranges. Guinea has one of the world's richest deposits of bauxite, and this, together with alumina, iron ore, and aluminum are the leading exports.

Guinea was one of the few former French dependencies which elected to separate itself from the French Community, although French remains the official language and French technical assistance is provided under an agreement made in 1963. The capital is Conakry. Population, about 4,010,000.

Ivory Coast. A republic of western Africa with a southern coast line of 34 miles on the Gulf of Guinea. It is bounded west by Liberia and Guinea, north by Mali and Upper Volta, and east by Ghana. Its area is 127,520 square miles.

About 90 per cent of the population is engaged in agriculture, animal husbandry, fishing, and forestry. The leading products are yams, cassava, bananas, corn, and rice. Mahogany is obtained from the forests. Diamonds and manganese are exported. The population numbers about 4,100,000. The capital is Abidjan. The Ivory Coast is a member of the French Community.

Kenya. A constitutional democracy of East Africa with an eastern coast line on the Indian Ocean. It is bounded south by Tanzania, north by Sudan and Ethiopia, west by Uganda, and east by Somali Republic and the Indian Ocean. Its area is 224,960 square miles.

The northern three-fifths of the country is arid. Production comes chiefly from the south, which consists of a low coastal plain and a plateau varying from 3,000 to 10,000 feet in altitude. The forests of the uplands are preserved to conserve the water supply. Kenya is the largest source of tea in Africa. Other products are coffee, cereals, cotton, sisal, dairy products. Copper, gold, and salt are among the products of the mines.

The capital is Nairobi. Kenya is a member of the British Commonwealth of Nations. Population, 10,209,000.

Lesotho. An enclave within South Africa, known as Basutoland before emerging in 1966 from colonial status to Great Britain. Agriculture and stock raising are the chief occupations. Its area is 11,716 square miles and the capital is Maseru. Population, 1,081,000.

Liberia. A republic of western Africa with 350 miles of southern coast line on the Atlantic Ocean and stretching inland from 75 to 190 miles. It is bounded west by Sierra Leone, north by Guinea, and east by Ivory Coast. Its area is about 43,000 square miles.

Most of the country is covered with tropical forest. Rubber is the chief export, Liberia providing the United States with about one-tenth of its imports of natural rubber. Iron ore also is exported.

Liberia was founded by settlement of American slaves at the site of the present capital, Monrovia, by philanthropic societies, beginning in 1822. English is the official language, although the many indigenous tribes speak their own languages. Population estimated at 1,500,000.

Libya. A republic of north Africa on the Mediterranean Sea between Egypt and Algeria. Its southern, desert region borders Chad and Niger. The northern region is fertile and produces dates, olives, almonds, figs, and grapes. Petroleum is the most important mineral and accounts for nearly all of Libya's exports. Its area is 679,358 square miles; the population, 2,260,000. Tripoli is the largest city and shares with Benghazi the governmental administration.

Malagasy. An island republic in the Indian Ocean off southeast Africa, from which it is separated by the Mozambique channel, 240 miles wide at its narrowest point. The island, formerly known as Madagascar, is 980 miles long in a generally north-and-south direction with a maximum width of 360 miles and an area of 229,975 square miles. The interior is a plateau 3000 to 5000 feet in height, rising in the northwest to mountains with a maximum height of 9490 feet. Around the plateau are extensive plains, up to 50 miles wide on the eastern side and up to 100 miles on the western side.

Cattle breeding and agriculture are the chief occupations. The principal farm animal is the humped zebu. Agricultural products of the greatest importance are rice, cassava, sugar cane, coconuts, and bananas. Others include corn, vanilla, and potatoes. Among mineral products are graphite, mica, and phosphates. Cotton and silk weaving are carried on as well as food-processing industries.

The capital is Tananarive. The republic is a member of the French Community. Population, 7,185,000.

Malawi. A land-locked republic of southeastern Africa. It is bounded north by Tanzania, west by Zambia, and south by Mozambique. Its area is 46,686 square miles. Until 1964 it was the British dependency of Nyasaland. Principally an agricultural country, tea, tobacco, cotton, and peanuts are its leading products. Lilongwe is the capital. Population, 5,175,000.

Mali. A land-locked republic of western Africa, bounded north by Algeria, east by Niger, south by Upper Volta, Ivory Coast, and Guinea, and west by Senegal and Mauritania. Its area is about 450,000 square miles. It is traversed west to east by the upper reaches of the Niger River. On this river small steamboats connect Gao and Timbuktu with a railway leading through the capital Bamako and continuing in Senegal to Dakar, which port Mali has the right by treaty to use. Agriculture is being organized on collective principles. Cattle number about 4,000,000. The chief exports are peanuts, gum, dried fish, and hides. Mali is a member of the French Community. Population, about 5,600,000.

Mauritania. An Islamic republic of west Africa with a western coast line on the Atlantic Ocean. It is bounded east by Mali and south by Mali and Senegal. The area is 418,810 square miles, much of which is desert. Agriculture and animal husbandry are the main occupations, products including millet, rice, and corn. There are about 700,000 camels. Iron and copper have been discovered. The capital is Nouakchott. Population, about 1,500,000.

Morocco. A constitutional monarchy on the northwest coast of Africa and separated from Spain by the Strait of Gibraltar. With a northwestern coast line on the Atlantic Ocean and a northern coast line on the Mediterranean Sea, it is bounded east and south by Algeria. At the north facing Gibraltar are the Riff mountains and behind them run the Atlas mountains. The rest of the area consists of fertile alluvial plains and plateaus, but in the south and west the land is arid—the beginning of the Sahara desert. The area is estimated at 171,305 square miles.

Agriculture is the leading industry, supporting 70 per cent of the population, but phosphates make up the bulk of the exports. Farm products include wheat and barley, vegetables, canary seed, olives, almonds, and citrus fruits. Morocco is the world's leading producer of cork. Wine is produced in quantity, and sardines are exported. Mineral products, in addition to potash, include coal, iron, manganese, silver, and zinc. Islam is the established state religion. The capital is Rabat, and the largest city is Casablanca. Population, 16,309,000.

Mozambique. Formerly a Portuguese colony, Mozambique is bordered on the north by Tanzania, Zambia, and Malawi; on the west by Rhodesia and South Africa; and on the east by the Mozambique channel. The land area is 303,070 square miles. The eastern region is mostly coastal lowlands, while the interior is highland plains. Aluminum, asbestos, tin, tungsten, and coal are mined in the northwest, but the chief exports are cashew nuts, sugar, and cotton. Many Mozambicans travel to South Africa to work in the mines. The population is estimated at about 9,300,000; the capital city is Maputo.

Niger. A land-locked republic of north central Africa, bounded north by Algeria and Libya, east by Chad, south by Nigeria, and west by Benin, Upper Volta, and Mali. Its area of 490,000 square miles lacks water except in the west, which is watered by the Niger River and its tributaries, and in the south, where water is obtained from wells. The country is a plateau, and access is chiefly by air.

Agricultural products include peanuts, millet, cassava, cotton, and rice. The capital is Niamey. Niger is a member of the French Community. Population, about 4,239,000.

Nigeria. A republic of west central Africa with a southern coast line on the Gulf of Guinea, into which flows the country's principal river, the Niger. It is bounded west by Benin, north by Niger, east by Chad and Cameroon. Its area is 356,669 square miles. The coast is a belt of mangrove swamps, behind which is a belt of tropical forest 50 to 100 miles wide. Farther north the level rises, and open woodland and treed plains afford facilities for agriculture. The extreme north is desert.

Agriculture and stockraising are the principal industries, the northern regions producing peanuts, cotton, and hides, while cocoa, timber, and rubber come from the south. Minerals produced include tin, gold, coal, and petroleum. Among leading manufactures are soap, cigarettes, beer, margarine, textiles, cement, and canned foods. Of the estimated 62,650,000 inhabitants, nearly 14 million are Moslems and about 7 million are Christians. Nigeria is a member of the British Commonwealth. The capital is Lagos.

Rhodesia. A land-locked, south-central African republic, Rhodesia covers 150,820 square miles. It is bounded on the north by Zambia, on the east by Mozambique, on the south by South Africa, and on the west by Botswana. Most of the country is a high, rolling plateau; the chief rivers are the Zambezi and Limpopo. The land abounds in minerals—asbestos, coal, chrome ore, copper, gold, iron, lithium, nickel, phosphate, and tin. The Wankie colliery is the largest coal mine in the world. Tobacco is the main export yield; corn is the staple food and most important crop. Major industries include textiles, chemicals, and metal products. The population is 6,530,000; of these, 569,000 live in Salisbury, the capital, largest city, and industrial center of Rhodesia.

Rwanda. A republic of east central Africa, 10,169 square miles in area, bounded north by Uganda, east by Tanzania, and south and west by Zaire. Its agricultural industry produces coffee and cotton. The capital is Kigali. Formerly a Belgian trusteeship, it asserted its independence in 1962. Population, about 5,500,000.

Senegal. A republic of west Africa, on the Atlantic Ocean. Its capital, Dakar, is the extreme western point of Africa. Senegal is bounded north by Mauritania, east by Mali, and south by Guinea and Guinea-Bissau. Its area is 76,000 square miles. The surface is mainly sandy and supports an agriculture of which peanuts are the leading product. Dakar is the country's port and has a considerable concentration of industry, including cement and titanium concentrates. Peanuts and phosphates are exported in quantity. Senegal is a member of the French Community. Population, about 4,500,000.

Sierra Leone. A republic of western Africa with a southwestern coastline 212 miles long on the Atlantic Ocean. Having an area of 27,925 square miles, it is bounded north and east by Guinea and southeast by Liberia. The principal occupation is agriculture. Exports include palm kernels, coffee, cocoa, iron ore, and diamonds. The capital, Free-

town, is one of the finest ports in Africa. It was founded in 1787 by the British government as a home for destitute free slaves. Sierra Leone is a member of the British Commonwealth. Population, about 3,002,400.

Somali Republic. A republic of east central Africa with a northern coastline on the Gulf of Aden and a southeastern coastline on the Indian Ocean. Its eastern tip is the most easterly point of the continent. Having an area of 262,000 square miles, it is bounded west by Kenya and Ethiopia. About 80 per cent of the inhabitants depend on the livestock industry, most of the country being adapted to grazing rather than agriculture. Large uranium deposits were found in 1968. The capital is Mogadisho. It was previously an Italian colony. Population, about 3,221,050.

South Africa. A republic at the southern extremity of Africa, 472,494 square miles in area, with the Atlantic Ocean westward and Indian Ocean eastward meeting off its southern coast. South Africa is bounded north by its own dependency of South West Africa, Botswana, Rhodesia, and Mozambique. Lesotho and the former British dependency of Swaziland are enclaves within South Africa.

The surface is, for the most part, a high plateau, interrupted by isolated flat-topped hills called kopjes. The plateau slopes rapidly down near the coasts. A ridge, low in the west, passes around the southern and eastern parts of the plateau, reaching its highest point in the east central region of the country. This eastern ridge is the divide separating a large number of short rivers, draining toward the east and the south, from the Orange river, which flows westward across the country and empties into the Atlantic Ocean. Farther north, the Limpopo river rises on the interior plateau and makes its way north of the eastern ridge; then, turning southeast, it flows into the Indian Ocean.

The climate of South Africa is warm, and the soil is fertile. The precipitation varies greatly, being nearly 50 inches on the southeastern coast and falling to less than 3 inches farther north on the western coast. In the western part of the country, semiarid conditions prevail, and grazing rather than agriculture is the principal industry. Wool is one of the chief exports, and about half the world's supply of mohair comes from the Republic. Corn, wheat, oats, barley, and tobacco are also grown, and such products of subtropical agriculture as cotton, tea, and sugar cane are raised in the lower and moister coastal regions. The operation of ostrich farms constitutes a distinctive industry.

The exports of the greatest value are the products of the mining industry. South Africa is the world's chief source of diamonds and is by far the greatest gold-producing region of the world. The output of gold is several times that of Canada, the country which ranks second to South Africa. Other minerals obtained in important quantities include coal, tin, and copper.

The white population in 1961 was 3,067,638, while the native population stood at 10,807,809. The 1970 estimate of the total population was 21,402,470. About one-half those of the white race are of Dutch descent. The religion is predominantly Protestant. There are 16 universities, 11 for whites, 5 for nonwhites. Most of the country's 13,284 miles of railway is owned by the government.

South Africa is divided into four provinces. Cape of Good Hope is in the extreme south, and Transvaal, on the eastern side of the country, lies farthest north. Between the two lie the inland province, called Orange Free State, and Natal, which borders on the Indian Ocean. In eastern Transvaal is the Kruger national park, a 5-million acre sanctuary for big game, which attracts thousands of visitors each year. The center of governmental administration is Pretoria, but the legislature sits at Cape Town, which is the terminus of the partially constructed "Cape to Cairo" railway. The largest city is Johannesburg, situated in the Witwatersrand, which is among the richest gold-mining districts of the world. Kimberley is the chief diamond-mining center.

Spanish Africa. The possessions of Spain in Africa were diminished when, in 1968, it granted independence to *Equatorial Guinea*, which includes Rio Muni, Marcias Nguema, and a number of small islands in the Gulf of Guinea. The capital of the new Republic of Equatorial Guinea is Malabo. Ifni, an enclave on the Atlantic coast of Morocco, was turned over to that country by Spain in 1969.

The following is the only remaining province in Africa belonging to Spain:

Canary Islands, 2807 square miles in area, in the Atlantic off the coast of Morocco, with an estimated population of 1,138,800.

Sudan. A republic of northeast Africa lying directly south of Egypt and with a northeastern coast line on the Red Sea. With an area of 967,000 square miles, it is the largest country in Africa. It is bounded east by Ethiopia, south by Uganda, Zaire, and the Central African Empire, and west by Chad and Libya.

Nearly half the country is desert or semidesert, and grazing of cattle, sheep, goats, and camels is a principal occupation. Cotton is by far the most important crop and provides most of the exports, although the Sudan is the world's chief source of gum arabic. The Nile River flows north through Sudan, and its waters are used for extensive irrigation works, an agreement having been made with Egypt for diversion of the available water.

About four-fifths of the 14,770,000 inhabitants are Moslem Arabs. The capital is Khartoum.

Tanzania (*Tăn-zà-nē'à*). A united republic of eastern Africa, formed in 1964 of the former Tanganyika, fronting on the Indian Ocean and the large island of Zanzibar off its eastern coast. The republic has a combined area of 362,820 square miles, and has a population of 12,590,000. The capital is Dar es Salaam.

The mainland is bounded by Kenya and Uganda on the north; Malawi, Mozambique, and Zambia on the south; Lake Tanganyika, Burundi, and Rwanda on the west. Its area is 361,800 square miles. The surface slopes upward from the coastal plain on the east to a high plateau and the western mountain slopes. The forests produce camphor and mahogany. About half the world's supply of sisal, Tanzania's chief agricultural product, is grown here. As Tanganyika, the country was colonized by Arabs as early as the 8th century A.D. and was a possession of Germany before World War I.

The island of Zanzibar lies about 22 miles off the coast east of the mainland. Politically it includes also the island of Pemba, 25 miles to its northeast. The total area of the two islands is 1020 square miles. Often referred to as the "Isle of Cloves," the islands supply about 80 per cent of the world's cloves. Coconuts are also produced in quantity. Chief port is the city of Zanzibar. Population about 354,360.

Togo. A western African republic fronting southward on the Gulf of Guinea and stretching northward to Upper Volta with Ghana on the west and Benin on the east. Its area is about 22,000 square miles. The surface is hilly, rising to a maximum altitude of 3600 feet. It is partly forested. The rest of the surface consists of plains, some dry and others cultivated. Coffee is the main export, but Togo produces also cocoa, copra, cotton, kapok, peanuts, and cassava. The capital is Lome. It was a German colony before World War I and is now

a member of the French Community. Population, about 2,197,000.

Tunisia. A republic of north Africa with the Mediterranean Sea on the north and east. It is bounded southeast by Libya and west by Algeria. Its area is 63,362 square miles. The principal occupation of its estimated 5,270,000 inhabitants is agriculture, with large estates predominating. Chief products of the soil are cereal grains, olives and olive oil, citrus fruits, dates, grapes, and wine. Phosphates, iron ore, and silver ore are mined. Local and cottage industries produce wool, textiles, carpets, leatherwork, pottery, and copper ware. The population is predominantly Arab and Berber, but there is a large French minority. The capital is Tunis.

Uganda. An inland republic of central east Africa with an area of 91,343 square miles. It is bounded north by Sudan, east by Kenya, south by Tanzania and Lake Victoria, the world's second largest fresh-water lake, and west by Zaire. Its territory is traversed by the Nile River. Uganda is the largest coffee producer in the British Commonwealth, of which it became a member in 1962. Other products are tea, cotton, peanuts, sisal, and sugar. Copper and tin are the leading mineral products. Fresh-water fish are caught in large quantities commercially. The capital is Kampala. Population, about 11,171,900.

Upper Volta. An inland republic of western Africa, about 500 miles north of the Gulf of Guinea. It is bounded north and west by Mali, east by Niger, and south by Benin, Togo, Ghana, and Ivory Coast. Its area is 105,900 square miles. The surface is mainly a plateau of 600 to 1000 feet in altitude, on which are raised cattle, cotton, rice, and peanuts. The capital is Ouagadougou. Upper Volta is a member of the French Community. Population, about 5,870,000.

Zaire. With 904,757 square miles, it is the second largest country in Africa. It is bounded north by Central African Republic and Sudan, east by Uganda, Rwanda, Burundi, and Tanzania, south by Zambia and Angola, and west by the Atlantic Ocean and Congo.

The country is one of the richest sources of copper in the world, and its mineral wealth places it at the forefront of the African countries. Besides copper, it exports gold, radium, uranium, diamonds, cobalt, tin, zinc, tungsten, manganese, and silver.

The Congo River flows through the country. It and its tributaries provide transportation and extensive hydroelectric power. Tropical forests cover a considerable part of the country, and from them are exported mahogany, ebony, teak, and other valuable woods. Wild life includes elephants, lions, leopards, chimpanzees, apes, gorillas, giraffes, rhinoceroses, hippopotami, buffalo, hyenas, crocodiles, pythons, cobras, parrots, flamingoes, heron, and vultures. Ivory is exported.

Animal husbandry and agriculture form the occupation of most of the approximately 21,638,000 inhabitants, the chief exportable products being animal and vegetable oils, cotton, coffee, rubber, bananas, and manioc.

Zambia. An inland republic of south central Africa bounded north by Zaire and Tanzania, east by Malawi and Mozambique, south by Rhodesia and South West Africa, and west by Angola. The area is 290,586 square miles. Part of the southern boundary is the Zambesi river, from which hydroelectric power is developed in large quantities, particularly near Victoria falls, the world's largest cataract. The area is mostly a plateau with an equitable climate. The leading agricultural products are corn and tobacco. The country is one of the largest copper producing regions of the world.

Zambia, formerly a British protectorate, became in 1964 an independent republic within the British Commonwealth. The capital is Lusaka. Population, 4,751,000.

CITIES AND OTHER POINTS OF TRAVEL INTEREST

The following section contains descriptions of the principal cities and of other places in the continent which merit especial attention.

Addis Ababa. The capital of Ethiopia, situated in the center of the country at an elevation of about 8000 feet. It is connected by a 486-mile railway with Djibouti on the Gulf of Aden. It has a vast central market place where native and imported goods are sold. Population is estimated at 560,000.

Alexandria. The chief seaport of Egypt situated at the west of the Nile delta. The city has an industrial district with asphalt works and oil, rice, and paper mills. The chief exports are cotton, grain, rice, and sugar.

Alexandria was founded in 332 B. C. by Alexander the Great and was, for several centuries, the chief commercial city of the world. In ancient times, its harbor was famous for the Pharos, or lighthouse, a huge structure completed in 282 B. C. and regarded as one of the seven wonders of the ancient world.

In the 7th century, Alexandria was captured and sacked by the Arabs. Its importance in modern times dates from the construction of the Suez canal. Population, 1,801,056.

Algiers. The capital and chief seaport of Algeria. It lies near the center of the country's Mediterranean coast. The lower part, built by the French, has modern hotels, spacious squares, and ornamented parks, which present a marked contrast to the narrow streets and characteristic mosques of the Moorish section.

Algiers is one of the most important coaling stations on the Mediterranean Sea. It has an important trade, mainly with France. The chief exports are wine, fruits, olive oil, and cork. Population, 943,142.

Aswan Dam. A dam on the Nile River in Egypt at Philae about 700 miles up-stream from its mouth in the Mediterranean Sea. A dam was first completed there in 1902 and was heightened several times before construction was begun in 1960 on the "high dam." The "high dam" which required 10½ years to build at a cost of more than a billion dollars, partly supplied by Russia, was designed to increase 25-fold the water impounded for irrigation, to raise the water level 600 feet above sea level, and to back up the Nile for 300 miles, including 100 miles in Sudan. Development of over 9 million KW of power was envisaged, and Egypt's arable land would be enlarged by 30 per cent. Since the flood waters were scheduled to cover some 58 historic monuments, archeologists and governments hastened to devise and execute plans for their preservation. With an American contribution of a third toward the $31-million project, work was begun in 1964 on the dismantling at Abu Simbel of a temple hewn in rock containing four 65-foot statues of Rameses II. This monument, dating from 1300 B. C., was reconstructed from its parts on the heights above. At Philae, dikes were built to preserve a temple of Isis about 2000 years old.

Cairo (*ki'ro*). The capital of Egypt, and the largest city of Africa, situated on the Nile River about 100 miles from its outlet in the Mediterranean Sea. The city is an important center of trade.

Chief of the numerous sacred edifices of Cairo is the Sultan Hassan Mosque, which is regarded as the finest example of the Byzantine-Arabian architecture in existence. The El Azhar university, situated in the city, holds the leading place among the world's institutions for Mohammedan education. Cairo's site covers the remains of many cities that had fallen into ruins before the founding of the present city in 968 A. D. Population, 4,219,853.

Cape Town. The legislative capital of South Africa, occupying a picturesque site on the southwestern coast of the Republic. It stands at the head of Table bay, an inlet of the Atlantic Ocean. The city and several beautiful suburbs extend along a narrow coastal strip between the water and a group of precipitous mountains.

Cape Town is the chief seaport of South Africa, the exports ranking highest in value being diamonds and bar gold. Among the notable features of the city are the Parliament buildings, the public library; a 14-acre botanical garden; the Cape observatory; and the Castle. The last-named edifice was built as a defensive work in 1666, 14 years after the founding of a Dutch colony on the present site of the city. Cape Town passed into the hands of the English in 1806. Population, 807,211.

Casablanca. The chief city and seaport in Morocco. It has a large airport as well as a fine harbor. Following its capture by American forces in 1942, Casablanca became headquarters for the movement of Allied troops on their way to North Africa and the Mediterranean region. Population, 1,120,000.

Dakar. The capital and chief port of Senegal. It is the westernmost point on the coast of Africa and terminus of transatlantic flights between Africa and South America. Prior to Senegal's independence, Dakar was the administrative center of French West Africa. It has numerous industrial establishments. Population, 374,700.

Dar es Salaam. The capital and chief port of Tanzania. It is carefully laid out with wide streets and substantial buildings—features which it owes to the Germans, who made it the administrative center of German East Africa. The British took it in 1916. Population, 250,000.

Giza (*gē'zē*). A village of Egypt about three miles from Cairo. It is notable for the pyramids which stand in the vicinity. The largest was erected by Cheops, an Egyptian king who lived about 3000 B. C. According to Herodotus, 100,000 men were employed for 20 years in building it, while 10 years were occupied in transporting the stones. It is about 480 feet in height with a base 764 feet square. The pyramid is believed to have been originally encased with marble. Since 1000 A. D., however, the exterior stones have been removed, leaving visible a structure of rough limestone blocks forming steps with a platform of considerable area at the top. This pyramid was one of the seven wonders of the ancient world and is the only one of the seven still in existence. Two other major pyramids and nearly 40 minor ones are included among the pyramids of Giza. They were intended to serve as tombs for their builders. The great sphinx is located in the approach to Giza, where it might serve to frighten evil spirits away from the pyramid tombs near by. The sphinx is an image of the head of the god Harmachis attached to the body of a lion. The whole figure is 66 feet high and about 172 feet long and is carved out of the solid rock.

Johannesburg (*yō-hăn'ĕs-bŭrg*). The largest city and commercial metropolis of South Africa, lying in the south central part of the Transvaal province. The city was founded in 1886 and owes its importance to its location on the Witwatersrand, in the midst of the richest gold field in the world. Johannesburg is regularly laid out and well built, presenting a more completely modern appearance than any other city on the continent of Africa. It contains the University of the Witwatersrand.

Johannesburg was the center of the agitation which resulted in the Boer war. The days of the Boer régime are recalled by a dismantled fortress overlooking the city and by a monument, which stands in a nearby field, commemorating the Boer declaration of independence in 1880. The city was occupied by the British in 1900. Population, 1,152,525.

Karnak, El (*kär'năk*). A village of Egypt on the right bank of the Nile River about 400 miles southeast of Cairo, famed for its ruins of ancient Egyptian temples. The chief one is the temple of the god Amen-Ra. It was erected about 4000 years ago and is the largest temple in the world. There is comfortable standing room for as many as 90 people on the top of many of the columns still erect.

Luxor. A village of Egypt near the Nile River a short distance southwest of El Karnak and about 400 miles above Cairo. Luxor is known for the numerous tombs nearby, which contain the mummies and treasures of ancient Egyptian monarchs. These treasures, which were intended to serve the spirits of their deceased owners, amount to millions of dollars in value. The tombs are hewn in the rock and usually have, on their walls, elaborate carvings, which have done much toward the unfolding of early Egyptian history. One of the more remarkable of such tombs was that of Tutankhamen, discovered by Lord Carnarvan in 1922.

In Luxor stand two colossal statues, one of which is said to represent the god Memnon. It is a Roman restoration of a former statue, which, before its destruction by an earthquake, is said to have given forth a sound each morning when struck by the rays of the rising sun.

Nairobi. The capital of Kenya, situated about 300 miles inland from Kenya's port Mombasa, with which it is connected by rail. Its altitude is 5000 feet, and its climate is favorable. Population 314,760.

Port Said (*pōrt să-ēd'*). A seaport of Egypt at the Mediterranean end of the Suez canal. It has an export trade in cotton and is an important coaling station. Its features include a large lighthouse, whose light is visible 24 miles out at sea, and a colossal statue of De Lesseps, the French engineer under whose direction the Suez canal was constructed. Population, 282,977.

Pretoria. The administrative capital of the Republic of South Africa. It is an inland city, situated in the northeastern part of the Republic in the Transvaal province. Its streets are broad and regularly laid out. The outstanding architectural feature of the city is the large group of government offices. They are in the Renaissance style of architecture and have a central tower surmounted by a statue of Liberty. Pretoria is the seat of Transvaal University college. Population, 1960, 422,590.

Timbuktu. An inland city of Mali near the southern border of the Sahara desert and on the edge of the marshes of the Niger River. The city was formerly one of the chief centers of Mohammedan influence in Africa, the center of an immense caravan trade in gold, ivory, wax, salt, hardware, beads, and cloth. The principal buildings—a large Mohammedan library and several mosques of striking appearance—date back beyond the 18th century. Population, about 8735.

PRINCIPAL WORLD PORTS*

Port traffic statistics for ocean-borne cargoes are difficult to make comparable owing to the different methods used in measuring cargoes. The following table showing ship entrances with net registered tonnage gives a fair idea of the traffic and importance of the ports listed. Figures are from the Bureau of Foreign and Domestic Commerce.

Rank	Port and Country	Number of Vessels	Net Register Tons	Rank	Port and Country	Number of Vessels	Net Register Tons
9.	Antwerp, Belgium	11,125	18,730,000	15.	Marseille, France	9,135	16,612,000
6.	Baltimore, U.S.A.	56,067	21,008,000	38.	Melbourne, Australia	3,396	7,613,000
41.	Bombay, India	33,731	6,547,000	36.	Montevideo, Uruguay	1,631	8,087,000
17.	Boston, U.S.A.	7,340	14,978,000	33.	Montreal, Canada	5,725	8,516,000
20.	Buenos Aires, Argentina	14,826	13,435,000	29.	Naples, Italy	9,008	10,809,000
48.	Calcutta, India	1,296	4,059,000	32.	Newcastle, England	8,532	8,596,000
43.	Capetown, South Africa	1,629	5,454,000	21.	New Orleans, U.S.A.	16,287	13,319,000
50.	Charleston, S.C., U.S.A.	10,668	3,226,000	1.	New York, U.S.A.†	92,032	68,598,000
42.	Cherbourg, France	952	6,478,000	24.	Norfolk, U.S.A.	7,089	12,222,000
7.	Colombo, Ceylon	2,708	20,425,000	8.	Osaka, Japan	18,999	19,600,000
39.	Copenhagen, Denmark	25,432	7,452,000	11.	Philadelphia, U.S.A.‡	8,302	17,907,000

AUSTRALIA

An island continent lying southeast of Asia between the Indian and the Pacific Ocean. The western portion of Australia forms one of the oldest land surfaces of the globe. The continent is about one-fourth less in area than Europe, but is nearly as large as the continental United States and, with the exception of Antarctica, is the only continent lying wholly in the southern hemisphere. Australia is 1800 miles from Asia, 4500 miles from Africa, 6300 miles from South America, 6700 miles from the United States, and 11,000 miles from England. The island lies between 10° 39′ and 39° 11′ south latitude and between 113° 5′ and 153° 16′ east longitude, and from east to west is 2400 miles long and from north to south, 1971 miles. The total area is 2,971,081 square miles, of which 1,149,320 square miles, or about five-thirteenths, are within the Torrid Zone. The population is 12,099,100.

Surface. Strong contrast in elevation above sea level is strikingly absent in Australia. The highest point is Mount Kosciusko, which has an elevation of 7328 feet. The greater part of Western Australia consists of a low plateau averaging about 1000 feet in height. This plateau extends eastward into South Australia and Northern Territory. To the eastward of this plateau lie the lowlands of the Lake Eyre and Murray River basins. Along the eastern coast of the continent the land rises to an average elevation of from two to three thousand feet, forming the Great Dividing range. This range extends practically the full length of the eastern coast. At the southern end of the coast, the range turns westward and disappears in western Victoria. The most elevated area, the Australian Alps, is in the southeastern part of the continent, near the border of New South Wales and of Victoria. The low-lying coastal strip is very narrow along eastern Australia, but it widens about the Gulf of Carpentaria in the north and around Western Australia. The main watershed of the continent is formed by the Great Dividing range, from which practically all the rivers of importance rise. The country around Lake Eyre is a basin of internal drainage. The West Australian plateau is an arid region with only a few short streams flowing down the western scarp.

Climate. The climate of northern Australia is tropical, and the mean annual temperature rises in places to 85° F. The range of temperature in the interior is very great. In central Australia, heavy frosts occur at night during the winter, while in summer the temperature in the shade may rise above 130° F. The southern part of Australia lies within the South Temperate Zone and near the south coast the mean annual temperature is about 60° F. In summer, the southern coastal areas are tempered by sea breezes, but are subject to extremely sudden changes of temperature. Hot north winds from the interior may be replaced by cold south winds, the thermometer showing a fall of 20° or more in about 20 minutes. These southerly changes rarely occur in the inland districts, and within 100 miles of the coast the temperature at midday may rise to 100° F. or over for days or even for weeks.

Snow may lie for months on the higher portion of the Australian Alps, but over the greater part of the continent snow is rarely, if ever, seen.

Rainfall. A line running generally from Sharks' bay on the west coast to Sydney on the southeast coast divides the northern area of summer rains from the southern area of winter rains. In the winter months, June to September, areas of low pressure move northward from the antarctic region to a latitude sufficiently low to bring rain to Tasmania and the southern projections of the continent. In the summer, however, these areas do not move so far to the north. As a result, summer rains seldom occur, except on the west coast of Tasmania. In summer, the thermal equator is over northern Australia, and the northwest monsoons bring rain to the northern coast line, January and February being the wettest months. Monsoonal tongues sometimes extend southward as far as northern Victoria and produce extremely useful rains.

The rainfall in the remaining portion of Australia is governed mainly by the southeast trade winds. These winds bring summer and autumn rains to the eastern coast. The greater part of the moisture is deposited on the eastern highlands. The trade winds pass on as dry winds and, becoming heated, absorb moisture rapidly, thereby causing the aridity which characterizes large parts of central and western Australia. Cairns, on the northeast coast, receives over 100 inches per annum, while a large portion of the interior receives less than 10 inches. Wheat may be grown in some areas in the south, which have about 10 inches of rain, because the rain that does fall comes at the right time.

The rains of northern and of southern Australia are fairly reliable, but the central area shows great variation, and disastrous droughts sometimes occur over a large portion of the continent. During such drought periods, there is an immense loss of cattle and sheep, as it is impossible, under present conditions of transportation, to move the vast numbers of stock to the better-watered areas. Artesian wells have improved conditions somewhat by affording a supply of drinking water for the stock; but unfortunately the water is not suitable for irrigation.

Irrigation. Owing to the small rainfall over large portions of Australia, irrigation is impracticable except in limited areas, such as the Murray River basin. In recent years considerable areas in New South Wales and Victoria have been irrigated as a result of progress on the Snowy Mountains Project which diverts waters from the Australian Alps into the Murray-Murrumbidgee Irrigation Area. The Goulburn valley is served from the Waranga basin. Water for the Mildura and Red Cliff fruit growing settlements is pumped from the Murray River.

Rivers. The interior of the continent being dry, there are comparatively few rivers. Australia has only the one small snowfield, which feeds the Murray River. Of the streams flowing into the Pacific, the Burdekin and the Fitzroy, both in Queensland, are the largest. Each drains an area of about 55,000 square miles. The chief river of the north, the Roper, flowing into the Gulf of Carpentaria, is navigable for 75 miles from its mouth. The largest river system is the Murray with its tributaries—the Darling, the Murrumbidgee, and the Lachlan. These rivers drain south Queensland, western New South Wales, and northern Victoria. There are other streams, such as Cooper's Creek, which, in time of abnormal rains, carry enormous volumes of water inland to lakes which have no outlet, such as Lake Eyre, Lake Gairdner, and Lake Frome. Generally, however, these streams contain water in their upper courses only, because, by evaporation and soakage, the water is lost, and the remainder of their channels is marked by occasional water holes, which also dry up in time of drought.

On the east, north, and west coasts, short rivers flow from the mountain slopes to the sea. But there are no long navigable waterways penetrating far into the interior, like the Mississippi in North America and the Nile in Africa. Hence the development of the continent has been much retarded.

Minerals. Australia is fairly rich in mineral resources. Gold, discovered here in 1851, has yielded the most valuable returns. In the early days most of the gold was obtained from alluvial deposits or gold placers. Deep leads or deeply buried alluvial deposits also gave splendid returns. When the

alluvial areas were worked out, the miners turned their attention to the quartz reefs from which the alluvial gold had been derived, and more costly methods of winning the gold were introduced. Copper, tin, lead, silver, zinc, manganese, antimony, wolfram, and bismuth have been mined, and important deposits of such minerals as gypsum and phosphates are being worked.

Precious stones, including diamond, sapphire, topaz, and opal, are found. Agates are fairly abundant.

Black coal occurs in large areas in eastern Australia and in Tasmania. Western Australia draws its supply largely from the Collie coal field, situated in the state. Thick seams of brown coal occur in southeastern Australia, especially near Morwell in Victoria. Building stones have been quarried in all the states.

MINERAL PRODUCTION OF AUSTRALIA, 1967

ITEM	Quantity	$A1,000*
Black coal	34,799,000 t.	160,099
Brown coal	23,386,000 t.	20,686
Copper	90,252 t.	72,515†
Gold	801,000 f.oz.	24,371†
Iron ore	18,536,000 t.	82,994
Lead	375,031 t.	73,654†
Silver	19,783,000 f.oz.	N.A.
Zinc	399,582 t.	29,354†
Value of all mining & quarrying		696,701

* Value at mine; includes value of materials used in production process. † Value of all minerals containing the metal.

Vegetation. The continent has over 7000 species of plants found nowhere else in the world. Many of them have fossil representatives in America and in Europe. Characteristically Australian are the gum trees, or eucalyptus, and the acacias. Eucalypts number over 230 species and are found in all places capable of supporting vegetation. Some are only a few feet in height, as the mallee and snow gum; some rival California's giant sequoias. Oil is secreted in the leaves of numerous species, and a gumlike resin exudes from the trees when the bark is injured. Some of the most durable timber known is furnished by various eucalypts, as the jarrah, red gum, and ironbark.

Much sunshine and too little rain compel many Australian trees to hang their leaves vertically, only the edges being turned to the sun. By this means the amount of evaporation from the leaves is diminished. The eucalypts are evergreens, but in many cases they shed their bark. The acacias, or wattles, constitute another important group, the members of which vary, according to their environment, from small shrubs to trees 100 to 150 feet in height. The bark of some varieties is used for tanning. The golden wattle is regarded as Australia's national flower.

Other forms of natural vegetation include the grass tree, resembling a tall stump from which grass sprouts at the top; tree ferns as large as palm trees; the banksia or Australian honeysuckle; and the native cherry, noted for having the stone outside the fruit.

Fodder Plants. Many acacias provide fodder for sheep and cattle. Other shrublike fodder plants, growing in the dry interior, are saltbushes, cotton bushes, and bluebushes. Australia's saltbushes have proved so valuable as sheep foodplants that they have been introduced into the arid regions of the southwestern United States.

Timber. Forest areas occupy 24,500,000 acres, which is about one-twentieth of the surface of Australia. Of this total, 15,895,781 acres are held as timber reserves. Soft woods, such as kauri pine, red cedar, silky oak, and Queensland maple, are found in the tropical forests of Queensland. Murray pine and Huon pine, the latter growing in Tasmania, are other important soft woods. The hard woods include many species of eucalypts, such as ironbark, red gum, gray box, yellow box, blue gum, and stringybark. These grow mainly on the highlands of eastern and southeastern Australia. Jarrah and kauri flourish in southwestern Australia. Blackwood, a species of acacia, is used extensively for furniture.

Grassland. The eastern half of the interior is a vast sheep pasturing country, though the rainfall is light. The soil is rich alluvium, and in good seasons grass is abundant. In time of drought the grass dries and is scattered by the wind, leaving the land perfectly bare. When the drought breaks, the grass springs up and grows with great rapidity. European fodder grasses have been planted over considerable areas. Farther west, plants needing but little water, wattles and saltbushes, mallee and mulga scrub, and the wiry spinifex, or porcupine grass, cover a large part of Australia's semidesert.

Jungles. In the northern part of Australia, a region of tropical heat and of heavy rains, there are found, in all the lowland districts, dense forests containing eucalypts, bamboos, palm trees, beautiful orchids with singular flowers, and gigantic lilies six to eight feet high, bearing dark red blossoms. Such jungle growth is variously known as bush, brush, or scrub. The term "bush" is frequently applied to any area in which the natural trees have not been cleared off to any extent.

Fauna. The fauna of Australia is quite distinct from that of the northern hemisphere. It is most closely related to that of South America. The characteristic mammalian forms are the marsupials, which, with few exceptions, are found elsewhere only in the fossil state. The higher mammals are represented only by the dingo, or native dog, probably introduced by the aborigines, and by a few rodents. The marsupials, or pouched animals, include the kangaroo and the wallaby, which are typically Australian. Other forms are the wombats, bandicoots, opossums, or possums, and the native bear, or koala. The Tasmanian wolf and Tasmanian devil are marsupials now confined to Tasmania. Outside the Australian area the only living pouched animals are the Patagonian opossum-rat and the North American opossum. The Monotremes, which are the lowest order of the mammals, have no living representatives outside Australia. The Australian forms include the duck-billed platypus and the echidna, or anteater. Both are egg laying forms and constitute a link between the mammals of today and the great reptile family from which the birds and mammals have developed.

Among the more remarkable birds are the emu, cassowary, kookaburra (laughing jackass or giant kingfisher), native turkey, black swan, lyre bird, and bower bird. Brilliant plumaged parrots and the yellow-crested cockatoo are abundant.

Two species of crocodiles are found in north Queensland. The largest lizard is called the "iguana" or "goanna" and may reach a length of 5 feet. Snakes, both venomous and nonvenomous, are fairly abundant.

Fish. Excellent food fish of many kinds abound in Australian coastal waters and in most of the rivers. The remarkable ceratodus or lungfish occurs in the Burnett and the Mary River in Queensland. Several species of European fish have been acclimatized. Trout may now be caught in a number of the mountain streams.

Pearling. Pearl fishing is a lucrative occupation off the northern and northwestern coasts of the continent. Some of the nearer pearl-oyster banks, however, have been practically exhausted, owing to persistent gathering of the shellfish and failure to allow the beds time enough to restock.

Sheep Raising. Gold brought Australia into the circle of the nations, but her greatest source of wealth is her merino sheep. Sheep raising is the continent's main industry. Pasturage for sheep is less dependent on rainfall than is pasture for cattle; sheep thrive where cattle would starve. Australian wool is the thickest and finest in the world. Hence wool growing is a profitable industry in the east central part of Australia. Wire fencing is used to enclose the "stations" or "runs" on which sheep are grazed. Merino sheep, improved wonderfully from the old Spanish stock, form the largest flocks. The stations vary greatly in size and in the number of sheep carried. Many of the very large stations have been subdivided, but recently, in the Riverina, there was one station which carried 150,000 sheep. Australia has over 120,000,000 sheep and exceeds in number any other sheep raising area in the world.

Large cattle stations are situated in the northern parts of Australia, especially Queensland. Dairy farms are abundant in the well watered districts of eastern and southern Australia. Horses and pigs are also raised.

ANIMAL INDUSTRY OF AUSTRALIA

ITEM	Season 1967–68	Season 1960
Cattle, No.	19,218,000	16,503,000
Pigs, No.	2,056,000	1,424,000
Sheep, No.	166,912,000	155,171,000
Butter produced, lbs.	432,284,000	436,633,000
Wool produced, lbs.	1,769,688,000	1,680,000,000

Agriculture. The area under cultivation in Australia is gradually extending. In the southern coastal regions the rainfall is generally good; and oats, barley, maize, and lucerne are the principal crops. Apples, pears, peaches, and other such fruits are largely grown. Inland, wheat is extensively cultivated, the area under cultivation increasing as means of communication are improved. Apples, oranges, lemons, peaches, apricots, grapes, and currants are readily grown in the irrigation areas. In the coast regions of Queensland, sugar cane, bananas, pineapples, and other tropical fruits are cultivated. Rice, cotton, and tobacco have been grown in various portions of the Commonwealth.

Manufacturing. Manufacturing is rapidly developing. Flour, woolen goods, leather, boots and shoes, furniture, iron and steel goods are among the products made for home consumption; and an export trade in manufactured articles is gradually developing.

VALUE OF CHIEF CLASSES OF PRODUCTS

ITEM	Value 1965–66 $A1,000	Value 1967–68 $A1,000
Agricultural	861,115	925,941
Pastoral	1,188,536	1,059,600
Dairying, Poultry and Bee-Farming	416,003	453,381
Forests and Fisheries	170,152	165,717
Mining	441,558	564,386
Manufacturing	6,275,355	7,430,738
Total	9,354,369	10,599,763

Commerce. Imports are principally European manufactures. Most of the trade is with Great Britain. Australia exports more wool than any other country. Among the other exports are wheat, butter, hides, tallow, and dressed meats, comprising chiefly beef, mutton, and rabbit. Summer dairy products, shipped on fast steamers with cold-storage chambers, reach Great Britain in a few weeks when the cows in that country are housed for the winter.

Canada and New Zealand are linked by cable with Australia. Most of the foreign capital invested in Australia is British. The country has about 28,000 miles of railway, of mixed gauges. A railway gauge unification scheme is being considered. The state governments own the railways while the Federal government owns the telegraph and telephone services, an interstate and the overseas airline.

The Federal District. In 1911, the Commonwealth acquired from New South Wales an area of approximately 912 square miles to be used as a Federal district. An additional area of 28 square miles on Jervis bay was obtained in 1917 to be used as a naval station. This Federal district was named Canberra. Building operations began in 1923, and the Australian parliament convened there for the first time in May 1927.

Inhabitants. The population of Australia in 1968 was estimated at 12,099,100. Protestants constitute the larger proportion of the inhabitants, but there is an influential Catholic minority. The Federal constitution forbids the establishment of any state-supported religion. In all parts of the Commonwealth, education is free, secular, and obligatory. Illiteracy is virtually unknown. The population is almost entirely of British origin, less than 5 per cent being of any other extraction. These figures do not include about 50,000 aborigines.

Name. The continent was formerly called New Holland. *Australia*, from the Latin word for southern, was suggested by Captain Matthew Flinders (1774–1814), an English navigator, who had explored the southern part of the island. The name came into use in 1817.

STATES OF THE COMMONWEALTH

The Commonwealth of Australia, a self-governing British Commonwealth member, was formed Jan. 1, 1901. It consists of six states—New South Wales, Queensland, South Australia, Tasmania, Victoria, and Western Australia—the Northern Territory, and the Australian Capital Territory. The following section contains a brief description of the states and of the Northern Territory.

New South Wales, a state of southeastern Australia. The Great Dividing range extends along the east side at a distance of 20 to 100 miles inland. On the west is a magnificent pastoral country which gradually changes to arid plains farther inland. The pastoral area is the basis for Australia's great sheep industry. There are 48,000,000 sheep in this area alone. Also this state includes Australia's most important mining, farming, and industrial developments. Coal, gold, silver, lead, tin, antimony, manganese, bismuth, and copper are locally mined and iron ore is nearby and available. Farm crops are wheat, maize, barley, oats, potatoes, lucerne, tobacco, sugar cane, and grapes. Sydney, Newcastle, Broken Hill, Tamworth, Bathurst, Goulburn, Wagga Wagga, and Albury are important urban centers.

Forests cover the western slopes of the mountains and include such trees as the red cedar, eucalyptus, red gum, and murray pine. Acacias and mulga are shrubs of the arid regions. Unusual animal life is found, as kangaroos, platypuses, and echidnas. Rabbits introduced from Europe have multiplied and become a serious menace to sheep grazing since they also are herbivorous.

Queensland lies in the northeast part of the continent. The climate is subtropical to tropical. Along the coast and on the windward eastern side of the Great Dividing range the rainfall is heavy. Across the mountains and inland to the "Never, Never Country" the land is arid, again supporting immense herds of cattle and sheep. Tropical crops, as sugar cane, bananas, and rice, are grown along the coastal plains. Wheat is prominent about Brisbane. Natural forests still abound including such valuable trees as cedar, kauri, pine, silky oak, and maple. Leading cities are Brisbane, Rockhampton. Towns-

ville, Maryborough, Gympie, Ipswich, Toowoomba, and Charters Towers.

South Australia lies in south central Australia. The Flinders range, Spencer's Gulf, and a series of shallow saline lakes divide it into eastern and western sections. The east is well watered and fertile; the west is desert. The Murray River flows through the southeastern corner. Temperatures are extremely high in desert sections in summer but frosts occur in the higher lands in winter. Ranching prevails, with sheep the most prominent. Adelaide is the state capital and most important city. Other cities are Whyalla, Port Pirie, Port Augusta, and Gawler.

Tasmania, originally called Van Diemen's Land, is an island state lying to the south of Victoria, from which it is separated by Bass strait. It consists of one large and numerous small islands. The climate is temperate and moist. Mines produce silver, lead, copper, gold, zinc, tin, and coal. Besides metals, Tasmania exports fruits, dairy products, potatoes, wool, hides, and timber. Hobart is the capital and principal port.

Victoria is a comparatively small state on the southeast corner of Australia. The section of the Great Dividing range known as the Australian Alps is in the eastern part. The coastline is 680 miles long on the south and the Murray River forms the north boundary. As in Tasmania, just across the straits, the climate is temperate with moderate temperatures and sufficient rainfall for cropping except in the northwest. Grazing is important with sheep raising first. Farming and manufacturing are rapidly developing. Melbourne is the capital. Other important cities are Ballarat, Bendigo, and Geelong.

Western Australia comprises all of western Australia to the 129° Meridian east. It is a huge area with greatest dimensions being 1480 miles north-south and 1000 miles east-west. It is largely an arid tableland with a narrow strip of coastal lowland. The southwest corner of the state has moderate temperatures and sufficient rainfall, crops and livestock. The extreme north is tropical with abundant rainfall. Gold is the most valuable in mineral output. About Perth, the capital city, a wide variety of temperate and subtropical crops are grown, such as wheat, oranges, grapes, lemons, and olives. Other important cities are Fremantle, Midland, Albany, Coolgardie, Kalgoorlie, Geraldton, Northam, Collie, Bunbury, and the port of Broome.

Northern Territory is the northern central section of the continent and includes the Arnhem Land peninsula. Its dimensions are 900 miles north-south by 560 miles east-west. The coastline is 1040 miles in length. The area is largely tableland with a low narrow tropical coastal plain in the north. This state is not especially well developed because of heat and aridity. The northern part has tropical rainfall mainly in summer. Darwin is a port, has an important international airport and is the center of the Territory Administration. Alice Springs is the other important town in the Territory.

STATISTICS OF AUSTRALIA

States and Territories	Area in sq. mi.	Pop. 1968 est.	Capital
New South Wales	309,433	4,430,200	Sydney
Victoria	87,884	3,356,900	Melbourne
South Australia	380,070	1,136,400	Adelaide
Queensland	667,000	1,751,800	Brisbane
Tasmania	26,215	386,000	Hobart
Western Australia	975,920	930,800	Perth
Northern Territory	520,280	64,000	Darwin
Federal District (A.C.T.)	939	117,200	Canberra

PRINCIPAL CITIES

The following section contains a brief description of the chief cities of Australia, including each of the state or territorial capitals. The population of Australia shows a marked tendency to concentrate in the cities, the five largest of which contain almost 50 per cent of the country's inhabitants.

Adelaide. The capital of South Australia, situated in the southern part of the state on the Torrens River, about six miles from its mouth in the Gulf of St. Vincent. A dam here forms the river into a lake a mile and a quarter long. The city stands on a wide plain near the base of the Mt. Lofty range and is divided by the Torrens into South Adelaide and North Adelaide.

The manufactures comprise iron wares, leather, woolens, pottery, starch, soap, flour, and malt liquors. Adelaide is the trade emporium of South Australia and has a large commerce. Port Adelaide, the seaport of the city, is about 7 miles distant by rail. It is the seat of considerable manufacturing; is a port of call for vessels from Europe; and is connected by railway with the principal cities of the Commonwealth. Near by is the summer resort of Glenelg.

Adelaide was founded in 1836 and was named in honor of Queen Adelaide, consort of King William IV of England. Population, 794,300.

Ballarat. A prosperous inland city of Victoria, Australia, the center of a rich gold yielding district. It was the finding of gold nuggets near the present site of Ballarat in 1851 that started the rush of gold seekers into Australia. At Bakery Hill, there was found, in 1858, a nugget that was sold for about $50,000. Population, 41,037.

Brisbane. The capital of Queensland, Australia, situated in the southeastern part of the state on the Brisbane River, about 25 miles from Moreton bay. Brisbane is the center of commerce and of manufacturing for southern Queensland.

Steamers ascend the river and berth at the wharves. There is a regular steamer communication with other ports in Australia and with the chief ports of Europe, and of the United States. Among the manufacturing establishments are flour mills, tobacco factories, breweries, tanneries, and shoe factories. Coal is mined in the vicinity.

The climate is healthful though the mean yearly temperature is 68.9° F. in the shade. Higher education is afforded by a Teachers College, a Technical College, and the University of Queensland. Population, 813,300.

Canberra (*kăn'bĕr-ă*). The capital of Australia. It is a Federal territory, 912 square miles in area, situated about 150 miles southwest of Sydney and 60 miles inland from the east coast of Australia. The city is built on the Molonglo River and is picturesquely surrounded by mountains. It was laid out by W. Burley Griffin, of Chicago, whose plans were adjudged the best in a world-wide competition. These plans call for streets in concentric circles with radiating avenues. The National War Memorial Museum, Institute of Anatomy, overseas embassies, Australian National University (1949), National Observatory and Canberra University College (1932), and government buildings are tourist attractions. Population, 110,000.

Darwin. A port city, named after Charles Darwin, and the government seat of the Northern Territory, Australia. Almost 2000 miles from the nearest metropolis, Darwin is the terminus of the overland telegraph and of the cable to Java and Singapore. In 1974, a cyclone struck Darwin, leaving 50 dead and destroying 90 per cent of the city. Reconstruction started immediately and it was estimated that it would take 5 years to complete. Population, 45,000.

Hobart. The capital of the Australian island state of Tasmania. The city is situated on the Derwent estuary.

The manufactures include woolens, hats, flour, pottery, leather, and jam.

Most of the exports consist of fruits, hops, grain, wool, and timber. Many Australian visitors are attracted to Hobart by the cool and invigorating climate. The city is the seat of the University of Tasmania.

Hobart was founded in 1804 and was named Hobart Town in honor of Lord Hobart, then secretary of state for the colonies. In 1881 the name was changed to Hobart. Population (with suburbs), 144,000.

Melbourne. The capital of Victoria, on the Yarra River about two miles from its mouth in Hobsons bay, an arm of Port Phillip bay. The river is navigable by vessels drawing less than 22 feet of water, but large steamers usually anchor in the bay at Port Melbourne.

The University of Melbourne stands in the foremost rank of institutions of higher learning.

Melbourne has large docks. Served by regular steamer communication with ports in Asia, Europe, and America, the city is a great emporium of foreign commerce. Railroads connect it with all the chief cities in Australia.

From 1901 to 1927 it served as the temporary capital of the Commonwealth. Population, 2,319,700.

Perth. The capital of Western Australia, occupying a picturesque site in the southwestern part of the state on

Melville water, an expansion of the Swan river. The city is 12 miles by rail from its port, Fremantle, a town at the mouth of the river on the Indian Ocean.

The University of Perth was founded in 1912. Population, (with suburbs) 499,494.

Sydney. The largest and oldest city in Australia and the capital of New South Wales. Sydney is picturesquely situated on Port Jackson, a magnificent expanse of water, which forms a landlocked harbor extending 20 miles inland. The harbor is spanned by a steel arch bridge having a main span of 1650 feet, one of the longest in the world. The water in the harbor is deep enough to permit ocean-going ships to dock at the wharves and quays. Favored by this advantage, the city has become a naval station of the first rank.

Sydney has an enormous commerce. The harbor is crowded with shipping from foreign ports, and the staple Australian products are exported in immense quantities. Favored by the proximity of vast coal deposits, Sydney is also a manufacturing city. Cars, locomotives, hardware, foundry and machine shop products, clothing, boots and shoes, textiles, machinery, and malt and distilled liquors are some of the manufactures. An annual sheep show is an event of great commercial importance.

Sydney has 647 acres of parks within the city boundary and 680,000 acres of reserves and commons in the metropolitan area.

Adjoining Victoria park stands the sumptuous main edifice of the University of Sydney with the Macleay museum of natural history.

The city's mean annual temperature is about 63.1° F., which is nearly the same as the average yearly temperature of Lisbon. Sydney was founded in 1788 by Captain Arthur Phillip, who had been sent by the British government to select a site for a colony. Population, 2,444,735.

NEW ZEALAND

A self-governing country consisting of two large islands to which are attached politically a number of small islands lying at some distance from the main group. New Zealand is situated in the south Pacific Ocean about 1200 miles east of Australia. It lies 7000 miles almost due south from Alaska and is 4000 miles west of the coast of Chile. It is 5400 miles by direct route from San Francisco. The two large islands are called North island and South island and are separated by Cook strait, which has a width varying from 16 to 90 miles. The two islands lie entirely in the South Temperate Zone and form a group stretching about 1000 miles in a general northeast and southwest direction and having a maximum width of 180 miles. The total area of New Zealand including Stewart Island and the Chatham Islands is 103,736 square miles.

North Island. The northern portion of New Zealand has an area of 44,281 square miles. It is 515 miles long, and its greatest breadth is 180 miles. The island may be likened to an inverted shoe the toe of which is a long irregular peninsula extending to the northwest. This peninsula is attached to the rest of the island by a narrow isthmus, consisting of a neck six miles in width separating Hauraki gulf on the east from Manukau harbor on the west. The arch of the shoe is represented by the Bay of Plenty in the north. The only remaining inlet of any considerable size is Hawke bay on the east. North island has the two best ports of New Zealand, Port Nicholson in the south and Waitemata at the isthmus in the northwest.

Most of the surface is gently undulating with low, heavily forested hills. A volcanic area, beginning in the south, passes through the center of the island as far as the Bay of Plenty. Much of this region will not support grasses, but trees cover parts of it. It occupies the southern extension of the island from coast to coast, but, where the width of the island increases, a fertile area spreads out on each side and runs along each coast in a belt averaging about 40 miles in width. These tracts are well adapted for grazing. The northwestern peninsula is in large part covered with a heavy clay, which yields returns only in response to intensive cultivation. The peninsula has areas of rich alluvium, however, in which the mangrove, the orange tree, various palms, and the giant kauri pine flourish. The partially fossilized resin of this pine is excavated and exported in quantity to be used in the manufacture of varnish and of linoleum.

The volcanic area of North Island contains many notable features. The highest volcano is Mount Ruapehu, which has an altitude of 9175 feet. It is situated in Tongariro national park, about 20 miles southwest of Lake Taupo, New Zealand's largest inland body of water. Stretching north from the mountain is a region of about 5000 square miles abounding in hot springs, geysers, pools of boiling mud, and colored lakelets. This region formerly contained a famous series of pink and white terraces of volcanic formation. In 1886, however, they were blown up in an eruption which tore a chasm in the earth nine miles in length. Farther south, on Cook strait, stands one of the most beautiful mountains of the island, Mount Egmont, an extinct volcano 8340 feet in height. No country has so large a proportion of its area incorporated in national parks as New Zealand. Covering over 2,500,000 acres, these reserves embrace a variety of scenery unmatched in any other park system of the world.

The rivers of the island are short. The longest is the Waikato River, which drains the waters of Lake Taupo northward to an outlet on the west coast. It is navigable for 70 miles of its course, but it shares with nearly all the other rivers of New Zealand the disadvantage of having at its mouth a bar which obstructs navigation.

South Island. The southern portion of New Zealand is slightly larger than the northern, having an area of 58,092 square miles. Off its southern coast, and separated by Foveaux strait, lies Stewart Island, which has an area of 670 square miles. About 350 miles to the east lie the Chatham Islands, 372 square miles in area. The length of South Island is 530 miles. It has a fairly uniform breadth of about 100 miles.

The outstanding feature of the surface is a mountain range called the Southern Alps, which runs from end to end near the western coast of the island. The mountains reach a maximum elevation at Mount Cook, which has an altitude of 12,349 feet. The scenic grandeur of the region is comparable to that of the European Alps. On the western slope, many glaciers flow down to the edge of the coniferous forests which cover a large part of the mountain sides. East of the divide are several long glacial lakes. The largest, Lake Wakatipu, has a depth of more than 1500 feet, and its wild, mountainous surroundings impart to it a beauty rivaling that of Lake Lucerne in Switzerland. The eastern slope descends to a plateau flanked on the east by a ridge of mountains passing through the center of the island. East of this ridge the land inclines toward the sea in grassy terraces, which provide the largest stretch of arable land in New Zealand.

Other Islands. New Zealand controls a number of islands in the south Pacific Ocean. They have a total area of about 500 square miles and a population of approximately 15,000. The more important of these islands are Cook Islands, about 1500 miles northeast of North Island, and Auckland Islands, uninhabited, 200 miles south of New Zealand. The Cook Islands support about 21,000 inhabitants, mainly of Polynesian race, who export tropical fruit and coffee. New Zealand formerly held a mandate over Western Samoa, which became independent in 1962. This group of fertile islands of 1130 square miles is about 1000 miles to the north and had an estimated population of 137,000 in 1968.

Climate. The prevailing winds of New Zealand blow from the west. They carry sufficient moisture to foster everywhere on the islands a vegetation of a uniform greenness that recalls the verdure of Ireland. In South island, where the mountains reach a greater height, much of the moisture is precipitated as rain on the plateau, and the warm, dry winds, descending from the elevated regions into the eastern plains, occasionally cause droughts of

sufficient duration to injure the crops. Except in the mountains, New Zealand is free from severe frosts, while in North island, where two-thirds of the population is concentrated, the climate is subtropical. Tempering breezes, however, blow incessantly from the ocean; yellow fever is unknown, and there are few mosquitoes or other pests usually found in subtropical regions. As a result, the mortality rate of New Zealand is one of the lowest in the world.

Flora and Fauna. The most characteristic plant of New Zealand is the fern, which flourishes in great variety everywhere. The so-called tree fern often reaches a height of 40 feet. About two-thirds of the indigenous species of vegetation are found nowhere else, and most of the others resemble those of Australia. The eucalyptus and acacia, however, which predominate in Australia, are not found in New Zealand. The nikau palm occurs even on South island, which is the southern limit for true palms. The kauri pine, the beech, and many other hardwood trees formerly covered much of the region's surface. Phormium, or New Zealand flax, is the country's outstanding contribution to the economic plants of the world. The fiber is used for binder twine and ropes. The cultivation of phormium has been introduced into Ireland, America, and several other regions of the earth. A noticeable feature of New Zealand's flora is the comparative absence of brilliant flowers.

New Zealand has not a single indigenous mammal. The dog and the rat, however, were brought by Polynesian settlers, and wild pigs, rabbits, and many other forms of animal life have been introduced by Europeans. There are no snakes, but there are a few lizards peculiar to the country. The area is the sole habitat of many species of birds, including the kiwi, or apteryx, a wingless and tailless bird the size of a hen. The kiwi is related to the moa, a bird which was formerly very numerous in New Zealand but which has been exterminated within the past few centuries.

Stock Raising. The bulk of New Zealand's wealth is derived from sheep and cattle. The wool clip normally amounts to more than 200 million pounds, approximately 20 to 25 per cent of that of Australia. Sheep skins to the value of 10 to 15 million dollars are exported annually. Frozen meat exports are valued at more than 50 million dollars, and 60 to 80 million dollars worth of butter and cheese is shipped. The stock is carried and fattened mainly on cultivated grasses, although in North island most of the pasturage is unplowed.

Agriculture. The greater part of the land sown to field crops is in South island. The produce, absorbed almost entirely by the domestic market, consists principally of wheat, oats, barley, and potatoes. Grain growing is not a specialized occupation, but is carried on along with stock raising. About two-thirds of New Zealand's surface is said to be capable of successful cultivation.

Mining. The four minerals produced in quantity by New Zealand are coal, gold, kauri gum, and silver. Most of the coal is mined in South island, but very little is sent out of the country. Gold is found in both islands, and heads the list of mineral exports. Gold mining was an attraction which drew large numbers of settlers in the decade 1861-71.

Manufacturing and Trade. The chief manufactures of New Zealand are connected with stock raising and dairying. After meat packing and the making of dairy products, the most important industries are lumber mill operations, printing, and the manufacture of flour, textiles, leather, and metal products. Industrial disputes are settled by compulsory arbitration.

Most of the trade is with Great Britain. The United States, Canada, and Australia rank next in order. The exports normally amount to over 300 million dollars in value, most of which is represented by the products of New Zealand's characteristic industry, the raising of sheep and other livestock. The imports usually approximate the same value as the exports, the chief articles being iron and steel products, textiles, motor cars, oils, clothing, paper, and tobacco products.

Internal Communications. New Zealand has about 3450 miles of railroads, practically the entire mileage being owned and operated by the government. The greater part of the mileage is on South island. The telephone and the telegraph system are also under government ownership.

Inhabitants. The aborigines of New Zealand are called Maoris, a Polynesian people which is believed to have displaced an earlier race some six centuries ago. They were polygamous, and occasionally indulged in cannibal feasts. Among them, it was supposed that the seat of the soul was the left eye. In warlike arts, wood carving, dyeing, and tattooing, they had developed a considerable skill. After a desperate resistance to the British settlers, they accepted the religion and the manner of life of the newcomers. In 1968, the Maoris in New Zealand numbered 219,042.

The population of New Zealand, 1968 estimate, was 2,776,266, nearly all of whom were of British descent. A little less than two-thirds of the population resides in North Island, the rest living in South Island and the dependencies. The capital is Wellington and the largest city is Auckland, both of which are in North Island.

There is an excellent educational system, at the head of which stands the University of New Zealand with four affiliated colleges. The university is not a teaching body. It has the power of granting degrees and is charged with conducting the examination of students prepared by the colleges. Over one-third the population are members or adherents of the English Church. The Catholics number about 11 per cent of the total.

New Zealand is divided into nine provincial districts, of which four are in North island, five are entirely in South island, and one is partly in South island and partly in other islands. Those in North island are Auckland, Wellington, Hawke's Bay, and Taranaki. Within South island are the provincial districts of Canterbury, Nelson, Westland, Marlborough, and the greater part of Otago. Otago includes also Stewart and other outlying islands.

PRINCIPAL CITIES

Auckland. The largest city of New Zealand, beautifully situated on a cluster of extinct volcanoes at the neck of the northwestern peninsula of North Island. The isthmus is six miles in width, thus providing the city with two natural harbors, one on each side of the isthmus. The eastern harbor is protected by a volcanic cone rising to a height of 1000 feet. This harbor has been elaborately improved and is the point of export for kauri gum and a large part of the lumber shipped abroad. The chief industries include shipbuilding, sugar refining, and the manufacture of rope and of machine shop products.

Auckland is the seat of Auckland University College and has an art gallery, a library with a valuable collection of rare manuscripts, and a museum containing many Maori relics. The mountain sides in the vicinity are terraced by former Maori fortifications. The Domain, one of the four parks of the city, contains a fine botanical garden. Auckland was until 1865 the capital of New Zealand. Population, 548,293.

Christchurch. The capital of the provincial district of Canterbury and the second largest city of New Zealand, situated near the center of the eastern coast of South island on the Avon River seven miles from its mouth. The city lies on a fertile plain and is the center of the surrounding agricultural and grazing interests. Frozen meats, wool, and lumber are exported. The chief manufactures include agricultural machinery, leather goods, furniture, and clothing.

Christchurch was founded by the "Canterbury pilgrims," a group of churchmen who left England about 1849. Many of the streets are named after English dioceses. Canterbury college is the leading educational institution. The Anglican cathedral with its dominating spire is the finest

piece of church architecture in New Zealand. A museum contains numerous remains of the moa, an extinct wingless bird which is peculiar to New Zealand. Population, est., 250,000.

Dunedin. The capital of the provincial district of Otago, situated on Otago harbor, an inlet on the southeastern coast of South Island. The chief exports are wool, frozen meat, and gold. Dunedin is the seat of Otago College, the largest institution for higher education in New Zealand.

Dunedin is connected by rail with Christchurch to the north and with Invercargill to the south. The population is about 80,000.

Invercargill (*ĭn'vĕr-kär'gĭl*). A port and city at the southern extremity of South Island. Invercargill is the regular starting point for journeys to Lake Wakatipu and other glacial lakes of the Southern Alps. It has several woolen and lumber mills. Population, 43,800.

Wanganui (*wŏ'ngä-nōō-ē*). The principal port on the west coast of North island, lying about 120 miles north of Wellington. It is regularly laid out at the foot of low hills, from the summit of which may be seen the snow-clad volcano of Mount Ruapehu. Wanganui is the export center for a pastoral and agricultural region. Population 36,000.

Wellington. The capital and third largest city of New Zealand, situated at the geographical center of the country, on a mountainous site at the southern end of North Island. It fronts on Lambton harbor, the most commodious in New Zealand. The port is equipped with modern facilities for handling the city's extensive commerce, which includes a large export trade in wool, meat, hides, skins, butter, cheese, and hemp. Wellington's manufactures embrace chiefly packed meats, woolen goods, soap, matches, rope, and brick. Printing and the assembling of motor vehicles are other important industries.

The government and principal office buildings are substantial, modern structures. The city has a university, two museums, an art gallery, and a modern research laboratory. Besides 1613 acres of parks and reserves in the city, Wellington owns a 970-acre belt of grazing land, accessible to the public, and Williams park, a seaside resort on Days bay. The 30-mile drive around the Wellington waterfront is one of the finest scenic routes in Oceania. Population, 167,859.

GREAT CITIES OF THE WORLD

The source of the above data was the *Rand McNally Commercial Atlas & Marketing Guide*, 1976. The figures for the cities in the U.S. are 1975 Rand McNally estimates. The populations for the foreign cities were derived from censuses, official estimates and unofficial estimates.

ANTARCTICA

Isolated, inaccessible, and for a long time undiscovered, the continent of Antarctica received special attention from several nations during the International Geophysical Year of 1957–58. Improved equipment and techniques made possible the accumulation of much new data concerning the area, topography, sea bottom, weather, depth of ice, mineral resources, animal and vegetable life, fossils, and other aspects of the great Ice Age land mass which surrounds the South Pole.

To analyze and evaluate all the information thus obtained is a major undertaking which may require several years during which important additional findings are certain to be made in the continuation of some investigations beyond the time originally fixed for the IGY studies.

Conditions are such as to make international cooperation in Antarctic exploration cordial and promising. It is true that some overlapping territorial claims here have been made by different countries from time to time, dating back to Kerguelen's identification of "South France" at longitude 50 in 1771 and English explorer Cook's discovery of new land in 1773, when he made the first recorded crossing of the Antarctic Circle. As additional land masses were discovered, other claims were entered, particularly by Britain, Australia, and New Zealand and, by implication, the United States through the establishment of outposts in "Little America" by Admiral Richard Byrd. However, since the continent is not suitable for colonizing, and since the utilization of its mineral resources is not feasible at this time, there has been comparatively slight political rivalry between the nations that havé sent exploring parties.

Because of Antarctica's remote location, immense area, and forbidding climate, its exploration is a major challenge to world scientists. Being an irregular land mass of 6,000,000 miles, extending roughly in a circle from the South Pole to meet the Atlantic, Pacific, and Indian oceans, it contrasts sharply with the Arctic region, whose center is an ice-covered sea and whose land boundaries within the Arctic Circle are marked by Canada, Alaska, and Siberia. People, timber, vegetation, and rich animal and mineral resources are found within the Arctic Circle, but not within the Antarctic, where winds reaching 100 miles an hour blow across snow-covered plateaus and temperatures of -80 are not uncommon. In earlier periods of exploration, sailing through "pack ice" or traversing frozen surfaces by dog sledges called for unexampled heroism and hardihood. More recently, the problem of transportation has been made easier by the use of airplanes and motor-driven vehicles such as the modern "snocats" and "weasels," but the storms and crevasses remain, and also the "white-out" peril to flyers.

For the United States, "Operation Deepfreeze," organized by the late Admiral Byrd and commanded by Admiral George Dufek brought to the task of IGY exploration the experience gained by Admiral Byrd's epoch-making 1928 expedition and such later ones as "Operation Highjump" of 1947 and its sequel "Operation Windmill." For the British, a Commonwealth Transantarctic expedition featured cooperation and friendly rivalry between Dr. Vivian Fuchs and Sir Edmund Hillary of New Zealand, best known as the conqueror of Mount Everest. In their race by separate overland routes to the South Pole, Hillary arrived first, on January 4, 1958, and Fuchs on January 19. Explorers had flown over the Pole not long before, but Hillary and Fuchs were the first in 46 years to reach it by the land route. In fact, there was a striking resemblance between this latest venture and the one that led to the reaching of the South Pole five weeks apart by Amundsen and Scott in the Antarctic "summer" of December-January, 1911–12. The tragic fate of Captain Scott soon after his triumph and his personal record of the last days have made his story one that is both inspiring and poignant.

To review the less dramatic and more prosaic aspects of the latest Antarctica explorations, we may note a few of the observations and estimates that have so far been reported. It is too soon to use the word "conclusions," for scientists are notably careful about expressing final judgments. However, some typical researches and their tentative results may be cited at this early stage of the investigation. For example, studies of the sea bottom were made to determine approximately when the Ice Age took over. It was believed that the seas were free of ice until about 3000 B. C. The Geomagnetic South Pole was relocated about 600 miles west of its earlier assumed location. Ore specimens of high-grade manganese silicate were found on Clark Peninsula. Seismic soundings proved some ice-covered land to be 7,000 feet above sea level. In addition to previously-known mountain peaks 15,000 feet high, new ones ranging up to 11,000 feet were sighted. Bedrock at the South Pole was estimated to be 903 feet above sea level but covered by 8,297 feet of snow and ice. Along a bank of the Upper Mawson Glacier, a New Zealand party found a coal field of six seams, each 6 to 12 feet thick. A Japanese party reported finding uranium. Valleys almost free of ice and snow were found extending north from the Hill Glacier in the Great Antarctic Horst Mountains. One party discovered a glacier-made gorge 9,000 feet deep and 30 miles long. When these countless other facts have been brought together and studied, the hitherto mysterious continent of Antarctica will be much better understood.

NOTED WATERFALLS

Name	Location	Height (feet)
Angel	Venezuela	3,300
Bridal Veil	Yosemite, Cal.	620
Cuquenan	Venezuela	2,000
Gastein	Austria	480
Gavarnie	Pyrenees	1,385

NOTED MOUNTAINS AND VOLCANOES

The following list is a selection representative of important mountains. It contains one or more of the higher peaks in various regions of the world, includes some of the greatest volcanic mountains, and embraces also a number of the most active volcanoes. All volcanic mountains, including extinct, quiescent, and active volcanoes, are in italics; some of the more active volcanoes are indicated by an asterisk thus, *Stromboli**.

Name of Mountain or Peak	Location	Height Feet
Aconcagua	Chile-Argentina	22,835
Adams	Washington	12,307
Altar	Ecuador	17,300
Ancohuma	Bolivia	21,489
Antisana	Ecuador	18,714
Apo	Philippine Is.	9,690
Ararat	Turkey	16,945
Arequipa (Misti)	Peru	20,013

Present (1970) form of government, which may differ from the form that is supposed to exist. An asterisk (*) indicates that the basic form of government is being influenced by the military; the actual difference between Rep.* and M.O., thus, may be very little in many cases. Abbreviations used: B.C.R.—British Commonwealth member with republican government; C.M.—Constitutional Monarchy; C.S.—Corporate State; D.R.—Democratic Republic (Communist); F.R.—Federal Republic; I.P.—Indian Protectorate; Isl. Rep.—Islamic Republic; M.O.—Military Oligarchy; P.D.—Parliamentary Democracy; P.R.—People's Republic (Communist); Rep.—Republic; R.M.—Representative Monarchy; S.R.—Socialist Republic (Communist). [2] Actual seat of government is La Paz. [3] Actual seat of government is The Hague. [4] Administrative capital. Legislative capital is Capetown; judicial is Bloemfontein.

MEANINGS OF PLACE NAMES

It is part of man's inquiring nature to be interested in the origin of things, but it was not until the 19th century that scholars began to investigate the origin of place-names by using scientific method. Before this, legend was usually employed to give meaning to a name whose origin was no longer self-evident. Historical documents are now carefully searched to find the earliest written form of a name and this is then interpreted by the language or dialect spoken in the area at that time. Even this is not valid if the meaning does not correspond with geographical or historical fact. Thus it is that many of the ancient names are still unintelligible.

This science of place-name study is called *toponymy* and it is a branch of *onomastics*, or the study of names in general. Apart from its intrinsic value in satisfying man's natural curiosity, toponymy also serves the student of language and history. Place-names often contain the only record of an extinct language and they can supply much valuable information on the origins and social customs of early peoples.

There are three main types of place-names and most names may be so classified, whether they originated in 10th century Asia, 15th century Europe, or 20th century America. *Habitation* names have evolved from the name of a tribe who once inhabited the area, or from the name of an individual who once owned the land. The countries of Iran, Bulgaria, Finland, France, and Belgium are but a few which have received their names from tribes who lived there. Nearly all the major tribes of the American Indians have left their trace on the map. Usually the names of individuals are commemorated in the names of villages or small towns.

Nature names describe the place itself, its surroundings, or its position relative to an outstanding landmark or other town. Often these names are composed of only one element, such as Bonn, Vigo, Chester, and Mons, which mean simply "the city," "the village," "the castle," "the mountain." More often they have a qualifying element as is found in the names of Tallahassee, Casablanca, and Reykjavik, which mean "old town," "white house," and "smoky bay."

Commemorative or *historical* names form the final group. These may recall either an historical event, a famous person, or another place. Nice and Tirana, Washington and Constantinople, New York and New Orleans, are all names of this type.

The map of North America contains a rich variety of names because they have been contributed by men of many nationalities. The French in Quebec and Louisiana, the Spanish in California and the Southwest, the Dutch in New York, as well as the native Indians have all left their mark. In addition, the names of many towns were given by settlers to recall their homes in Europe.

Acapulco (*ä'kä-pōōl'kō*). Mexican town. From the Aztec *acall,pul,co*, "place covered with thick reeds."

Accra (*ăk'rä*). Capital of Ghana. The original tribe of fishermen who lived here were known to the natives of the interior as *Accras* derived from *nkran*, "ant."

Addis Ababa (*ăd'ĭs ăb'ä-bä*). Ethiopian city. Founded in 1887 as the new capital and named by the Empress Taitu. The name is Amharic for "new flower" and refers to its ideal situation.

Adirondacks. The Algonquin Indians who lived in these mountains were nicknamed *Ratirontakeke*, "they eat, i.e., live from, the forest." Adirondack is a Mohawk variation.

Alcantara (*ăl-kăn'tä-rä*). Town in Spain. Arabic *Al-Kantara*, "the bridge." The Romans built a famous bridge here which was constructed without the use of mortar.

Alcatraz. Island in San Francisco Bay. Site of former U.S. penitentiary. Spanish *Isla de Alcatraces*, "island of pelicans." The Spaniards found the place covered with these birds when they discovered it in 1769.

Al-Mausil. City in Iraq. Arabic for "place of connection." It is the meeting place of the ancient trade routes. The cloth called *muslin* was formerly made here.

Amalfi (*ä-mäl'fē*). Italian resort. Arabic *Al-Marfa*, "the port, landing-place."

Amarillo. Texas city. Suggested by the yellow banks of the nearby creek or the yellow flowers that cover the prairie in the spring. Buildings were painted bright yellow after the town was named. *Amarillo* is Spanish for "yellow."

Amritsar (*ŭm-rĭt'sĕr*). Sacred city of India. Built around a pool named "nectar of immortality." The name is Sanskrit.

Amsterdam. Dutch city. Low German name meaning "dam of the people living on the Amstel River." Amstel itself means "water-bank."

Anaconda. City in Montana. The mine here was named from a newspaper account during the Civil War when "Grant circled Lee like a giant anaconda."

Anacortes (*ăn'ä-kôr'tĕs*). City in Washington State. Originally named after the wife of the founder, Anna Curtis. Later altered to agree with the Spanish sound of other local names.

Anatolia. Ancient name of Asia Minor. From the Greek *anatole*, "rising of the sun."

Andes. South American mountain range. This Quichu Indian name means "metal" but refers especially to the copper which is mined here.

Androscoggin (*ăn'drŭs-kŏg'ĭn*). Maine river. Abnaki Indian for "place where fish are cured" by drying or smoking.

Angostura. Now Ciudad Bolivar, Venezuela. Located on the narrowest point on the Orinoco, it receives its name from the Spanish word for "narrow." Angostura bitters are from here.

Anticosti. Large island in the Gulf of St. Lawrence Most authorities see in the name a transposition of the Montagnais Indian name *Natiscotec* which means "place where bears are hunted."

Antigua (*ăn-tē'gä*). West Indian island. Columbus named the island in honor of the church of Santa Maria la Antigua ("the old") in Seville.

Antofagasta. City in Chile. "Place where copper is hidden" in the Quechuan Indian language.

Antwerp. Belgian port. Old Low German *aend-werp*, "against the dike or dam" referring to the original site of the city.

Aorangi (*ä'ô-räng'ē*). Maori name for Mt. Cook, highest peak in New Zealand. Maori *ao*, "cloud" and *rangi*, "sky." The peak is often covered with clouds.

Aral Sea. U.S.S.R. Its many willow-covered islands give this large inland sea its name. From the Kirghiz *aral*, "willow-plot."

Arctic (*ärk'tĭk*). The northern constellation known as the Great Bear is seen in this region. From the Greek *arktos*, "bear."

Argentina. The poet Barco Centenera first used the word Argentina in his poem of the same name in 1602. He was referring to the country's situation on the banks of the Plata River. The name is Spanish for "silvery."

Aroostook. River in Maine. Micmac Indian for "shining river."

Ascot. Village in England, the home of the Royal Ascot races. "Eastern cottage or sheep shelter." From Old English *east-cot*.

Asuncion. Capital of Paraguay. Named in honor of Our Lady of the Assumption. The name is Spanish.

Atacama. Desert in Chile. The Spanish form of Quechua Indian *tacama*, a type of black duck. These birds inhabit the area near the coast.

Atchafalaya (*ä-chăf'ä-lī'ä*). River and bay in Louisiana. "Long river" in the Choctaw language.

Atlantic. The ocean is named after the mythical island of Atlantis which was supposed to lie in the waters west of Mt. Atlas from which the name originated.

Australia. As early as the 16th century, various terms derived from the Latin *australis*, "southern," were applied by mapmakers to lands south of Asia.

Austria. Latinized form of German *Oster-reich*, the "eastern kingdom" of the Franks.

Azores. Islands in the Atlantic. Portuguese *Ilhas do Acores*, "Islands of hawks."

Bahrein (*bä-rīn'*). Islands in the Persian Gulf. Arabic "two seas," applied to land having water on both sides.

Baikal (*bī-kăl'*). The largest lake of Siberia. The lake has an abundance of fresh-water salmon. The term *baï-kol* is Turko-Tatar for "rich take."

Balkan. Mountain range and peninsula in southeastern Europe. This Turkish term meaning "mountain" was first used in 1808.

Ballarat. City of Australia. Officially *Ballaarat*, an aboriginal name meaning "camping-place." A swamp which was here was a favorite with the natives.

Baltimore. Maryland city. Cecil Calvert, Lord Baltimore, opened up the colony of Maryland. The barons of Baltimore came from *Bailena-tigh-mhor*, "town of the large house" in Ireland.

Bangkok. Capital of Thailand. In the Thai language this means "the place where the wild olives grow."

Basel (*bä'zĕl*). Swiss city. This name is derived from Celtic word which means "boar." The Gauls were devoted to a God in the form of a pig whose image has been found on many coins.

Beirut (*bā-rōōt'*). Capital of Lebanon. From the Phoenician *b'eroth*, "wells."

Belem. City in Brazil. Named in honor of Our Lady of Bethlehem, Portuguese *Belém*. The mental hospital in London, England called St. Mary of Bethlehem is the origin of our word *bedlam*.

Belfast. City in Northern Ireland, hence the town in Maine. Gaelic *Beal-feirste*, "ford at the sandbar" was the place where the Lagan River was crossed.

Belgrade. Capital of Yugoslavia. Serbian *Beograd*, "White City." In olden times the city shone white in the sun.

Belleek. Town in Ireland famous for its pottery. Gaelic *Beal-leice*, "ford-mouth of the flagstones."

Berezina. Russian river. Scene of battle during Napoleon's retreat from Moscow. Old Slavic *beréza*, "birch tree." The river banks were formerly covered with birch.

Berlin. German city. A wooden scaffolding was formerly erected over the river and was used to collect floating timbers and for fishing. Old Slavic *bruleni*, "water-rake."

Bethlehem. A village in Palestine. The name is from the Syrian *beit el lehm*, "house of bread." The city in Pennsylvania was named while some German settlers were singing carols in a stable there on Christmas Eve in 1741.

Biarritz (*byä'rĕts'*). French city. "Place of the twin oaks," from the basque *haritz*, "oak-tree."

Bihar (*bē-här'*). Town and state in India. The Sanskrit word *vihara* means "monastery." There was formerly a large Buddhist monastery here.

Bismarck. Capital of North Dakota. Originally Edwinton, but the name was changed by an overseas shipping agent in 1873 in honor of the German Chancellor. It was hoped that German settlers would thus be attracted.

Biwa. Largest lake in Japan. The lake is similar in shape to the Japanese *biwa*, a mandolin-type musical instrument.

Bizerte (*bē'zĕrt'*). Tunisian city. A gross Arabic corruption of *Hippo Diarrhytus*, a hybrid name from Phoenician *hippo*, "city" and a Greek term meaning "traversed by running waters."

Blarney. Castle in Ireland containing the Blarney stone Irish *Blárna*, diminutive of Middle Irish *blár*, "field."

Blenheim. German *Blindheim*. Village in Bavaria; site of famous battle in 1704. "Settlement in a blind valley."

Bombay. City in India. Portuguese corruption of the vernacular name *Mumbai*. There was a temple here dedicated to the goddess of the Koli fishermen, *Mumba*, or the "Great Mother."

Bonin Islands. South of Japan. Corrupted from Japanese *Munin*, "uninhabited." There were no natives on the islands when discovered by the Japanese about the year 1600.

Bonn. Capital of West Germany. Originally a Gaulish settlement whose name is simply a Celtic word for "city."

Bothnia. Gulf between Sweden and Finland. Lies on the eastern shores of *Botten*, a Swedish district. Old Norse *botn* means "valley bottom."

Bowery. Street in New York City. English spelling of Dutch *boererij*, "farm." Originally this was a lane which led to the farm of Peter Stuyvesant.

Brazos. River of Texas. Originally Spanish *Brazos de Dios*, "Arm of God." A mission on the river was destroyed by the Indians but the Spaniards believed it to be the work of God.

Bremen. German port. Middle High German *brëme*, "bank, shore."

Britain. From the Old French Bretaigne. Great Britain refers to the British Isles as opposed to Little Britain or *Brittany* in France. Both names refer to the home of the *Britons*, who were a Celtic people. The name is related to the Welsh word *pryd*, "picture," and refers to the custom of the Britons of tattooing themselves.

Brooklyn. Named by Dutch settlers after the town of Breukelen in the Netherlands. This name, originally *Broklede*, means "water-course through a swamp."

Bruges (*brōōzh*). City in Belgium. Although this name is usually associated with Low German *brügge*, "bridge," it is actually the Old Norse *bryggja*, "quay or landing-place." Named by the Vikings.

Brussels. Capital of Belgium. Records of the year 1107 show *Brucsella*, "house in the swamp."

Bryn Mawr. Suburb of Philadelphia. The railway station here was named after a local country estate which was so called after an ancestral seat in Wales. It is Welsh for "great hill."

Buffalo. This city in New York State was built on Buffalo Creek. The creek name is probably derived from the name of a local Seneca chief rather than from the animal itself.

Bulawayo. City in Southern Rhodesia. Zulu for "place of killing." Rebellious members of the Indunas tribe were formerly executed here.

Bulgaria. "Country of the Bulgars." From the Old Turkish *bulgar*, "mongrol, cross-breed," alluding to the mixture of races in this people.

Cadiz. City in Spain. Arabic *Gades*, from a Phoenician word related to the Hebrew *gader*, "protecting wall."

Cairo. Capital of Egypt. A Venetian corruption of the Arabic *Qahir al-Falak*, "The Triumphant of Heaven." The planet Mars was in the ascendant when the city was laid out.

Calcutta. City in India. Sanskrit *Kali-ghat*, "ghat of the Goddess Kali." A ghat is a flight of stairs leading to a river for the convenience of ritual bathers.

Calicut. City in India. Officially *Kozhikode*, meaning "cockfort." On his retirement, the last king of Malabar gave the Zamorin of Calicut as much land as was within earshot of a cock's crow.

Callao. Peruvian seaport. A Spanish word meaning "gravel" referring to the stony nature of the beach.

Calumet. River in Illinois which has given its name to the industrial district at the southern end of Lake Michigan. The name is French for "reed." The reeds which grew along the banks of the river were made into "pipes," *calumets*, by the Indians.

Cambodia. Republic in southeast Asia. A European form of *Kambuja*. Kambu was the mythical founder of the Khmer race which settled here.

Cambridge. University town in England and city in Massachusetts. Old English *Grantebrycg*, "Bridge on the Granta River." *Granta*, which is from a Celtic root meaning "muddy," was altered to *Cam* through Norman French influence.

Cameroon. African republic. Named for the Cameroon River. Early navigators found many prawns here and called the river, *Rio dos Camaroes*, "River of shrimps, or prawns."

Canada. Apparently derived from the Huron-Iroquois *kanata*, "village, collection of tents." The name is first mentioned in Jacques Cartier's narrative of 1534 and referred to a village called Stadacona where Quebec City now stands. Gradually extended to southern Ontario and Quebec and thence to the whole dominion.

Cannes (*kăn*). Resort on the French Riviera. This was originally a Phoenician settlement and contains the same Semitic root found in the name of the Biblical town of Cana. The name means "place of reeds." The English word *cane* is related.

Canton. City in China. This is a variation of *Kwangtung*, the Chinese province of which Canton is the capital. The area in southern China formerly known as *Kwang* was divided into the two provinces of *Kwangtung*, "Eastern Kwang," and *Kwangsi*, "Western Kwang."

Canton. City in Ohio. Named in the mistaken belief that it was directly opposite the city of Canton in China.

Cardiff. Chief city of Wales. The Welsh name is *Caer ar Daf*, "Fort on the Taff River." A Roman station was established here during the conquest of Britain.

Carlow. County in Ireland. Irish *Cetherloch*, literally "Quadruple Lake." The Barrow River anciently formed four lakes here.

Carmel. Mountain in Israel and many places in America. In historical times Mount Carmel was famous for the luxurious growth of plants on its slopes. Hebrew for "garden, orchard."

Carnegie. Old Scottish barony which was the seat of the Carnegie family. Gaelic *Cathair-an-eige*, "Fort at the Gap." This would refer to a mountain pass.

Carrara (*kȧ-rär'ȧ*). Italian town famous for its marble. From the Ligurian *caris, cararis*, "rock, stone."

Cartagena. City in Spain whose name has been transferred to cities in South America. Named after the ancient city of Carthage in North Africa. Phoenician for "new city."

Castile. Medieval kingdom of Spain. Spanish *Castilla* means "place of many castles."

Catamarca. City and province in Argentina. From the Kechua Indian *q'atamarca*, "village of the mountain slope." This city lies at the foot of the Sierra de Ambato.

Catskill. Creek and mountains in New York. *Kill* is a Dutch word for "creek" and the name means "creek of the cats or panthers."

Caucasus. Mountain range in southeastern Europe. The modern name comes from the Greek *Kaukasia*. The basic Indo-European root is seen in the Lithuanian word *kaukas*, "hill," and the English word *high*.

Chattanooga. City in Tennessee. A simplification of the Cree Indian *Chat-to-to-noog-gee*, "rock rising to a point." This was the native name for Lookout Mountain.

Cheddar. Gorge in England famous for its cheese. Earlier recorded as *Ceodre*, from the Old English *ceod*, "pouch." This would refer to the shape of the gorge.

Chemnitz. City in East Germany. A Slavic name meaning "stony river."

Chesterfield. Town in England. Old English *Cestrefeld*, "field by the Roman fortification." The word *cestre* is derived from Latin *castrum*, "fort" which is the origin of the French *chateau* and place-names such as *Castile, Lancaster, Winchester*.

Cheyenne. Capital of Wyoming. Named after the Cheyenne Indians. This is a French version of the name given to them by the Dakota Indians meaning "the red-talkers," that is, "those who speak in a strange tongue."

Chicago. French rendition of a native name. It is Algonquin Indian for "wild-onion place." The wild-onion or garlic formerly covered the low, marshy plain.

Chimborazo. Volcano in Ecuador. From the Kechua Indian *cimpu*, "multi-colored woolen threads" and *rasu*, "snowy peak." The debris on the slopes resembles the woolen threads in the *llautu* or headband worn by the Incas.

China. Named after the Ts'in Dynasty which ruled in China in the Third Century B. C.

Cimarron. River in New Mexico. Originally the Spanish word *cimarron* meant "wooded; mountainous," but later it was applied to anything that was wild or unruly.

Cincinnati. This city in Ohio was named in honor of the Society of the Cincinnati. This society was formed in 1783 by a group of officers in the Continental Army before its disbanding and was named after the Roman hero Cincinnatus.

Clare. Town and county of Ireland. A board was once used to cross over the River Fergus at this point. *Clar* is the Irish word for "plank."

Clyde. Scottish river famous for its shipbuilding. From a Celtic root meaning the "cleanser." Possibly in honor of a river goddess.

Coburg. City in West Germany. Formerly *Choburg* from a Slavic *chov*, "shelter." It means "the fort of refuge."

Cochabamba. City and department in Bolivia. Literally, Kechua Indian for "lake-plain." The natives used the term *bamba* (from which the word *pampas* is derived) for any barren expanse,

Cochise. Town and county in Arizona. Named in honor of Chief Cochise, the leader of the Chiricahua Apaches.

Coeur D'Alene. City in Idaho. This is the French name of the Skitswash Indians and means "awl-heart." It is said to have been applied by an Indian chief to indicate the size of a trader's heart.

Coleraine. Town in Northern Ireland. Gaelic *Cuil Raithin*, "ferny nook or corner."

Cologne. West German city where *eau-de-cologne*, or "water of Cologne" was originally made. Established by the Emperor Augustus as *Colonia Agrippina*, "colony or settlement of Agrippina." It was the birthplace of Agrippina, the wife of Augustus.

Colon. City in the Canal Zone. This place-name, like Columbus, Colombia, British Columbia, etc., was named in honor of Christopher Columbus. It is the Spanish form of the name.

Concepcion. City in Chile. Like many places in South America, this name commemorates a Feast of the Blessed Virgin. Concepcion alludes to her Immaculate Conception.

Connemara. District in the west of Ireland. Gaelic *Conmacne-Mara*, "place by the sea where the descendants of Chief Conmac reside."

Constantinople. Old name of Istanbul, Turkey. A Greek name meaning "City of Constantine." The Emperor Constantine made the old city of Byzanz the capital of Eastern Roman Empire in the year 330. The Greek word *polis*, "city" enters into the names *Naples, Tripoli*, and others.

Copenhagen. Capital of Denmark. Old Danish *København*, "Port of merchants." Copenhagen was the center of commerce for the western Baltic.

Corcovado. Mountain at Rio de Janeiro whose summit supports a famous statue of Christ. Portuguese *corcovado*, "hunchbacked," describes the shape of the peak.

Cork. City and county of Ireland. Originally *Corcachmor* which is Gaelic for "great swamp." A district in the city is still known as "The Marsh."

Corregidor. Island at the entrance to Manila Bay, Philippines. Ships formerly stopped here to have their paper checked and corrected. Spanish *corregidor* means "corrector."

Correggio. Town in northern Italy; home of Correggio, the artist. In the dialect of northern Italy the word *coréza*, from which this place-name is derived, means "a strip of land in the middle of a marsh."

Corvallis. Town in Oregon. From the Latin words *cor*, "heart" and *vallis*, "of the valley." Corvallis lies in the middle of the Willamette Valley.

Cotopaxi. Volcano in Ecuador. Kechua Indian *q'utu p'asi*, "smoky mound."

Couchiching. Ontario lake. The lake discharges the waters of Lake Simcoe into the Severn River. From Algonquin *kotchichi*, "discharge, emptying."

Coventry. English cathedral city. Old English *Cofentreo*. The town grew up around a tree belonging to a man called Cofa.

Crimea. Russian peninsula in the Black Sea. At the time of the Bosphoran Empire a protective moat and embankment were built across the isthmus here. From the Turkish word for "trench," *kyrym*.

Croatia. Ancient kingdom, now a federated republic of Yugoslavia. "Land of the Croats." The Croats are a Slavic people whose name originally derives from Old Persian *haurvata*, "shepherd." The French form of the name, *Cravate*, is the origin of our word *cravat*. This was originally a neckpiece worn by Croatian soldiers.

Cuba. Arawak Indian for "land." The apparent reference is to the island as the Mainland as opposed to the Lesser Antilles.

Cumberland. County in England, thence Cumberland Gap in Tennessee and many American place-names. "Land of the Cumbrians." The Cumbrians were Britons who inhabited the ancient kingdom of Strathclyde, which embraced Cumberland. Their name derives from Welsh *Cymry*, "compatriots."

Curitiba (*kōō'rē-tē'vȧ*). City in Brazil. Guarani Indian *curí*, a type of pine tree, probably the Araucaria. Literally, a "place of pine trees."

Cusco. City in Peru; former capital of the Incas. From the Kechua Indian word *qusqu*, "navel." The city lies in the middle of a valley.

Dachau (*dăĸ'ou*). City in West Germany. From Old High German *daha*, "clay," and *aue*, "watery place." The site of the original settlement was in a clay-rich swamp.

Dahomey. Republic of Africa. In the native language this is literally "the belly of Dan." In the 17th century a native king murdered a petty chief and built a house over his corpse. The chief's name was Dan, hence the original name, *Danhomé*.

Dalmatia. Coastal region of Yugoslavia. Home of the Illyrian tribe called *Delmatae* or "shepherds." Dalmatian dogs originated here.

Danube. European river. Its Celtic name was *Danuvius*, from an Indo-European root with the basic meaning of "that which flows or gushes."

Dar es Salaam. African seaport. Arabic *Bandar es Salaam*, "Harbor of Peace." So called by the Sultan of Zanzibar when he established a base here in the mid-19th century.

Darjeeling. Indian town in the Himalayas. From the Tibetan *Rdo-rje-gling*, "place of the dorje." A *dorje* is a mystical thunderbolt in Lamanist religion.

Darmstadt. City in West Germany. "Town on the Darm River." The Darm is named from Old High German *darm*, "intestine." There are many twists and turns in the river.

Denmark. Old Norse *Danmork*, "Country of the Danes." The Danes were originally a Germanic people who inhabited the marshy hollows of southern Jutland. Their name is related to the Old English word *dene*, "hollow, small valley."

Denver. English village. Ancestral home of the Denver family. From Old English *Dena faer*, "passage or road of the Danes." Denver, Colorado was named in honor of J. W. Denver, a Governor of Kansas Territory.

Derbent. City of the U.S.S.R. on the Caspian Sea. A defile here, called the Caspian Gates, locked the route through the Caucasus Mountains. From Persian *derbend*, "bolt, lock."

Derby. County town of Derbyshire, England. The 12th Earl of Derby established the Derby stakes at Epsom Downs; hence any similar annual race is called a *derby*. From Old Norse *djur-byr*, "homestead frequented by deer."

Detroit. City in Michigan. Founded in 1701 as Fort Pontchartrain du Detroit. The French word *detroit*, "straight, narrows," refers to the Detroit River.

Dnepr, Dnestr. Two great rivers of the U.S.S.R. Formerly *Danapris* and *Danastius*, which are Scythian names with the probable meaning of "nearer river" and "further river."

Dominica. Island in the West Indies. Spanish for "Sunday." It was discovered on a Sunday by Columbus.

Donegal. Irish county. English version of *Dun-na-nGall*, "fort of the foreigners." The "foreigners" were the Danes, who had an earthen fortification here before the 12th century.

Dordrecht. City in the Netherlands. Middle Dutch *Thur-drecht*, "through-channel." The city was built on a short stretch of water between the Dubbel and Mewerde Rivers.

Drammen. Norwegian river and city. Old Norse *Drofn*, related to the German word *trübe*, "gloomy." Indo-European rivers often have names signifying "dark, dismal, gloomy."

Dresden. City in East Germany. A Slavic name from Wendish *Drazhdzhanj*, "home of the forest-people."

Dublin. Capital of the Republic of Ireland. Irish *Dubhlinn*, "black pool." This was the name of that part of the Liffey River on which the city is built. Irish-speaking people refer to the city as *Baile-atha-cliath*, "town of the ford made of hurdles."

Dubuque. City in Iowa. Julien Dubuque, a French-Canadian trader settled here in 1788 in order to mine.

Dundee. Scottish city. Gaelic for "Fortress on the Dee River." The Dee, originally *Devona*, honors a river goddess.

Dunkirk. Town on the Belgian coast. Flemish *Dunkerque*, "church on the sand-dunes."

Durham. English city and county. Norman corruption of Old English *Dun-holm*, "hill-island." The city is built on a rocky hill nearly surrounded by the Wear River.

Durham. City in North Carolina. Originally Plattsburg, the name was changed in 1851 to honor Dr. Bartlett Durham whose forebears were from Durham, England.

Dusseldorf. City in West Germany. German *dorf* means "village." The name of the Dussel River derives from Old High German *doson*, "to rage, roar." Hence, "village on the banks of the roaring river."

Eboli. Town in Italy. Modern form of Celtic *Eburum*, "place of the yew tree."

Edmonton. Town in England and city in Alberta. Old English *Eadhelmstun*, "the homestead of Adhelm."

Egypt. Probably from an epithet of the city of Memphis, "Hi-ku-Ptah," which means "house of the spirit of Ptah." Ptah was one of the chief gods of ancient Egypt.

El Paso. City in Texas. In the year 1598, the Spaniards crossed the Rio Grande here and called the ford *El Paso del Norte*, "The Pass of the North."

El Salvador. Republic of Central America. So named in 1524 by Pedro de Alvarado in honor of Our Blessed Saviour (Span. *Salvador*).

Engadine. Swiss alpine valley. *En co de Ino* is the Raeto-Romansch form of Latin *in capite Eni*, land lying at "the head or source of the Inn River."

Erfurt. East German city. "Ford on the Erf River." *Erf* is a Germanic river-name meaning "brown-colored."

Erie. One of the Great Lakes and a city in Pennsylvania. Named after the Erie Indians. It is a French form of their original name of *Yenrish*, "Long-tailed." This tribe held the panther sacred.

Eritrea. Self-governing state in the Ethiopian federation. This territory lies on the shore of the Red Sea and its name is derived from the Greek *Ereuthre thalassa*, "Red Sea."

Essen. Industrial city in West Germany. In 898 written *Astnide* from Middle Low German *ast*, "forge." Therefore, "place of the forge."

Essex. County in England and many towns in North America. Old English *East Seaxe*, "East Saxons" as distinguished from the West and South Saxons.

Estonia. One of the Baltic states. "Land of the *Aestii*." This was a Germanic tribe who once lived on the shores of the Gulf of Riga and whose name possibly derives from the Latin *aestuarium*, "tidal waters, estuary."

Ethiopia. Republic in northeast Africa. From the Greek *aithein*, "to burn," and *ops*, "sight, face." This is the land of the people who have dark skin, literally, "burnt faces."

Faroe. Danish islands in the North Atlantic. Old Norse *faer*, "sheep." The islands still support large herds of sheep.

Foggia. Italian city. This name is derived ultimately from the Latin word *fossa*, "ditch, trench." In the dialect of North Italy, however, it refers to a place for threshing grain.

Formosa. The name the Portuguese navigators gave to the island of Taiwan in 1590. It is Portuguese for "beautiful."

Forth, Firth of. The long estuary of the Firth River, Scotland. Gaelic *Foirthe* from a Celtic *Vo-ritia*, "running under," hence, "the river with strong undercurrents."

France. "The land of the Franks." The name of the Franks is probably derived from a Germanic word related to Old English *franca*, "spear, javelin."

Frankfurt. The name of two German cities. German for "Ford of the Franks." The *frankfurter* originated here.

Fresno. City and county in California. From Spanish *fresno*, "ash-tree."

Funchal. City in the Madeira Islands. "Place where fennel grew," from the Spanish word for fennel, *funcho*.

Fundy. Bay between New Brunswick and Nova Scotia. It is an Anglicized form of the name *Fond de la Baie*, "far end of the bay," which appeared on French maps.

Galapagos (*gă-lă'pă-gŭs*). Pacific islands belonging to Ecuador. This is the Spanish name for a species of turtles found here.

Galilee. Sea in Israel and district of Palestine in Biblical times. From the Aramaic *galil*, "ring or circle," with reference to the fact that it was surrounded by Gentiles or foreigners.

Galle. Seaport of Ceylon. The place is built on a rocky promontory and named Haycock Hill. In the Sinhalese language, *gala* means "rock, hill." The Portuguese confused this with the Latin word for "rooster," *gallus*.

Garda. Lake in northern Italy. Named after the Veronese castle which *guarded* the military road near here.

Gaspe (*găs'pē*). Peninsula in the province of Quebec. Micmac Indian for "end of the earth."

Gaza. Town and strip of land between Egypt and Israel. A stronghold of the Phoenicians in ancient times, the place derives its name from their word *'azzah*, "firmness, strength." Gauze is said to have been first made here.

Gdansk. Polish city on the Baltic Sea. Germanic *Gutiskandje* means "end or coast of the Goths." Danzig is the German name.

Gdynia. Polish city. German *Gdingen*, from *G(u)dingen*, "place of the Goths."

Geneva. Swiss city. Originally *Genava*, a Ligurian name which means "knee or bend." The city is situated in a deep corner at the east end of Lake Geneva.

Gethsemane. Garden outside Jerusalem. This is the Aramaic name for a vat in which oil was stored after being pressed from olives. There was probably such a vat here as it is close to the Mount of Olives.

Gibralter. Named after Tariq Ben Zaid, the Moorish conqueror of the Visigoths. Arabic *Gabal Tariq*, "Mount of Tariq."

Gilead. Mountainous region of Palestine. Aramaic for "rugged country" as opposed to the fertile plain of Bashan.

Ginza. Main street of Tokyo. Literally "silver place." It derives the name from the silver mint which was located here.

Gonzaga. Town in northern Italy; home of St. Aloysius Gonzaga. Originally *Verecundiaca* or "property of Verecundius." Verecundius is a Latin personal-name meaning "modesty."

Gouda. Dutch town famous for its cheese. The town lies near the Gouwe River which was called *Golda* in the 12th century. It is Low German for "gold river" and refers to the yellowish-colored, muddy water.

Gramercy Park. New York City. Known to the Dutch settlers as *Krum Marisje*, "crooked little swamp."

Greenland. An English literal translation of Old Norse name. It actually means "new land" and not "green-colored land."

Guiana. Region in northern South America shared by the English, French, and Dutch. English spelling of Spanish *Gauyana*. The parrot which is native to the area is called by the Carib Indians *wayana*, and this is the origin of the place-name.

Guinea. Republic in northwestern Africa. The name is a European form of a Berber phrase meaning "land of the black men."

Hague, The. Capital of the Netherlands. Officially *'s Gravenhage*, "The Count's Hedge." First mentioned in the year 1242 as the residence of Count William II of Holland, *Die Haghe*.

Hainan. Chinese island. From the Chinese *hai*, "sea," and *nan*, "south." It lies in the sea south of the southern mainland.

Hainault. Province of Belgium. "Meadow on the Hagna River." The name Hagna comes from a Low German word meaning "hedge."

Haiti. Republic in the West Indies. The Arawak natives called the country *Aiti*, which in their language meant "mountainous."

Halifax. Cities in England and Nova Scotia. In the 12th century, *Haliflax*, Old English for "sacred flax field."

Hamburg. City in West Germany. From Old Saxon *hamme*, "enclosed place." The fort built here in the 9th century was once surrounded by trees.

Hanover. Cities in Germany and the United States. The German spelling is *Hannover*. From the German phrase *zum hohen Ufer*, "at the high bank." The city is built on the bank of the Leine River.

Hardwar (*hŭr'dwär*). Sacred town in India. Sanskrit *Hari dwara*, "capital of Hara." Hara is a title of the Hindu god Siva.

Harlech, Welsh castle and town. The Romans built a castle on a rock here. Welsh *hardd*, "beautiful," and *llech*, "rock." The same Celtic root may be seen in the name *Belleek*.

Hartford. City in Connecticut. Founded by settlers from Massachusetts led by Samuel Stone who was born in Hertford (originally *Hartford*), England. It means "Ford of the stag."

Heidelberg. City in West Germany. "Mountain of the heathberry." This is the same as the English bilberry.

Hereford. Town and county in England; many American towns. Old English *here-ford*, "army ford." This would be where a marching column could cross the river in closed order.

Hialeah. Suburb of Miami with famous racetrack. Named by Willie Willie, an Indian chief, whose town occupied the site until the end of the 1920's. Seminole-Creek Indian *haiyakpo-hili*, "pretty prairie."

Himalayas. Asian mountain range. The peaks are perpetually covered with snow. The name is Sanskrit for "abode of the snows."

Hiroshima. Japanese city. In 1594 a feudal lord built his castle here and named it *Hiro-shima-jo*, "Castle of the Broad Island."

Hoboken. City in New Jersey. Dutch settlers named the place after the town of Hobuechen, Holland. It means "place of the tall beech tree."

Holland. Former name of the Netherlands and still the name of a region. Originally *Holtland*, "wood-land." This part of the country was densely wooded in ancient times.

Holstein (*hōl'stīn*). Former duchy of Denmark and now part of the province of Schleswig-Holstein, West Germany. The Old Low German name was *Holt-seten*, "home of the forest-dwellers."

Honduras. Republic in Central America. Spanish for "depths." It is not known if the reference is to the coastal waters or to the inland valleys.

Hong Kong. British colony off the Chinese coast. Chinese *H'eng K'eng*, "Water-channel or harbour of the fragrant flowers."

Honolulu. Capital of Hawaii. The first element *hono* is common to many Hawaiian place-names and means "bay, gulch, or valley." Honolulu is "the sheltered bay."

Honshu. Largest island of Japan. Japanese for "mainland."

Hunan. Chinese province. Region "south of the lakes."

Hungary. The area was settled by the Ten Tribes of Oguz, Turkish *on ogur*, whose name was Latinized to *Ungari*. The initial *H* is by attraction to the name of the Huns.

Innsbruck. City in Austria. German for "bridge on the Inn River." The river-name is Celtic but the meaning is doubtful.

Iran. Old Persian *Airyana*, "Land of the Aryans." The Aryans were an Indo-European people who occupied the major portion of the country in historical times.

Iraq. That part of the Tigris-Euphrates Valley known as Babylonia was once called *'Iraq*, which is Arabic for "cliff."

Irrawaddy. River of Burma. Sanskrit *Iravati*, "giver of refreshment."

Israel. The origin of the name given in Genesis 32:22 is merely folk-etymology. More probably from the Semitic root *ishr*, "reliable, happy," referring to an ancient Canaanite god of fertility.

Istanbul. Capital of Turkey. The Byzantines referred to Constantinople, which was the former name, simply as *The City*. Hence the Greek phrase, *eis ten polin*, "to or in the city," from which the modern name is derived.

Italy. "Land of the Itali." The tribal name is derived from the Oscan dialect *Viteliu*, "young cattle," honoring Mars who was the god of bulls.

Iwo Jima. Japanese island. Japanese *iwo-shima*, "sulphur island." At one time there were important sulphur mines here.

Jaffa. City in Israel. A city established by the Phoenicians and mentioned in the Bible as *Joppa*. The name is Semitic and means "beautiful place."

Jakarta. Capital of Indonesia. It was named *Jayakarta*, "prosperous on account of victory," in 1527 after a successful battle there.

Jamaica. The abundance of springs on this West Indian island prompted the Arawak Indians to call it *Jaymaca* or "Island of Springs."

Japan. This is a 15th century Dutch corruption of the Chinese name *Jih-pen*, "Place of the Sun's Origin."

Jena. City in East Germany. Middle High German *jan*, "row of mowed hay or compost."

Jerusalem. Shalem was the local god of pre-Israelite Jerusalem. The name may be interpreted as "the foundation or city of Shalem."

Jodhpur. City in India. It was established by Rao Jodha in the year 1459 and called "City of Jodha." Riding breeches known as *jodhpurs* originated here.

Jordan. River of the Bible; thence the country through which it now flows. The river drops 1300 feet in its course and was known to the Hebrews as "the descender."

Kalgoorlie. Town and famous gold field in Australia. A shrub known to the aborigines as *galgurli* was a prominent feature of the local landscape.

Kanchenjunga (*kŭn'chĕn-jŭng'gă*). Mountain in the Himalayas and the 3rd highest in the world. Its five peaks are perpetually covered with snow, hence the Tibetan name, "the five repositories of the great snow."

Kandahar. City in Afghanistan. Founded in 330 B. C. by Alexander the Great. The name is a corruption of the original *Alexandria Arachosiarum*, "Alexandria of the Arachosian people."

Kanpur. City in northern India known as Cawnpore during the British rule. Sanskrit for "City of Kahn." Kahn is one of the names of the Hindu god Krishna and means "husband."

Katmandu. Capital of Nepal. A wooden temple was built here in 1596 for religious mendicants. Sanskrit *kath*, "wood," and *mandu*, "palace, temple."

Kennebec. River in Maine. The Abnaki Indian name meaning "long water" originally referred to the stretch between Skowhegan and Merrymeeting Bay.

Kent. County in England, and the name of many American towns. Known to Julius Caesar as *Cantium*, the area's name probably derives from Celtic *canto-*, "rim, border" as applied to a coastal district.

Khartoum. Capital of the Sudan. The Arabic name is *Rasel-Khartum*, "Cape of the Elephant's Trunk." At high water on the Nile, a spit of land having the shape of an elephant's trunk appears near here.

Kiel. City and canal in Germany. From the Low German phrase *tom Kyle*, "on the creek or inlet," referring to its position on Kiel Bay. The same word is the second element of the *Catskills*.

Kilimanjaro. Mountain in Tanganyika; highest in Africa. A native name which may be roughly translated as "mountain of the cold devils."

Killarney. Town and lakes in Ireland. Irish *Cill-airne*, "church of the sloes or blackthorn bushes."

Kirghiz. Soviet Republic in Asia. Home of the Kirghiz people. Their name comes from Kirghiz *kyr*, "wilderness" and *gizmak*, "to wander." It refers to their nomadic life.

Klondike. River and gold field in the Yukon Territory. This is a mispronunciation of the Indian *Thron-diuk*, "hammer-water." The natives hammered stakes across the shallow mouth of the river on which they hung their nets.

Koevorden. Town in the Netherlands. From Dutch *koe-voord*, "ford of the cows or oxen." This is the ancestral home of Capt. George Vancouver whose family name was originally Van Koevorden.

Kostroma. River, city and oblast of the U.S.S.R. Russian *koster'* is a type of sturgeon which abounded in the river.

Kuala Lumpur. Capital of Malaysia. In the Malayan tongue, *kuala* refers to any place where a river empties. *Lumpur* means "muddy." The waters here were muddied by the work of Chinese miners.

Kuwait. A shiekdom on the Persian Gulf. The name, which is a diminutive of Arabic *kut*, and meaning "small fort," was given by early settlers to the stronghold built in the center of the original tented village.

Labrador. That part of the Province of Newfoundland which is on the Canadian mainland. First noted on a map of 1534 as "land of the Labrador." The pilot on the English ship which sighted land here was a labrador (Spanish for "laborer") from the Azores.

Ladoga. Large lake in northwestern U.S.S.R. From the Finnish *aaldokas*, "tossed, disturbed." The waters of this lake are extremely rough in bad weather.

Lagos. Capital of Nigeria. Named by Portuguese explorers for the many lagoons and coastal lakes in the neighborhood. Portuguese *lago* means "lake."

La Jolla. Suburb of San Diego, California. This is a variant spelling of Spanish *hoya*, "pit, cavity," hence the pronunciation. It was the name of a rancheria in a hollow.

Lancaster. County town of Lancashire, England and a city in Pennsylvania. Old English *Loncestre*, "Roman fort on the River Lune." Lune is a Celtic river-name meaning "health-giving."

La Paz. Capital of Bolivia. Originally, in Spanish, *Pueblo Nuevo de Nuestra Senora de la Paz*, "New Town of Our Lady of the Peace." The name commemorates the treaty signed between two rival groups of Spanish *conquistadores* in 1548.

Laredo. Village in Spain and city in Texas. Nuevo Laredo is a Mexican city across the Rio Grande from Laredo. The name is related to Spanish *gleria*, "gravel" and refers to the stony river banks.

Las Vegas. City in Nevada and town in New Mexico. The Spanish word *vega*, "open plain," aptly describes the surrounding desert.

Latakia (*lăt'ă-kē'ă*). City and territory of Syria, famous for its tobacco. The Greek name was *Laodicea*, given by Seleucus Nicator in honor of his mother Laodice.

Latvia. Former Baltic state now part of the U.S.S.R. The country is named for the Late River near the Lithuanian border. The river-name is Lettish for "marshy, swampy."

Lausanne. City in Switzerland. Like many names in this area, this one is Celtic and proves that the Celts were here in ancient times. It means "river of the flat stones."

Lebanon. A country in Western Asia on the Mediterranean. From a Semitic word meaning "the white." It probably refers to the snowy peaks of the Lebanon Mountains.

Leipzig. City in East Germany. This is the German form of Slavic *Lipsk*, from *lipa*, "linden tree."

Lepanto. Strait in Greece where a famous naval battle was fought between the European powers and Turkey in 1571. An Italian corruption of Modern Greek *Epaktos*, originally *Naupaktos*, "place where ships were built."

Levant. Name applied to the eastern regions of the Mediterranean. A French term from the Latin *levans*, "rising," referring to the rising of the sun.

Lhasa. Capital of Tibet. Long known as "The Forbidden City" because of its inaccessibility. Tibetan *lha-sa*, "land of God." It is a holy city and the residence of the Dalai Lama.

Liberia. Republic of western Africa. The American Colonization Society settled emancipated American slaves here in 1822. The Latin name, meaning "land of the free," commemorates their new-found freedom.

Lido. Island reef off Venice, Italy, famous as a resort. Latin *litus*, "beach."

Lille. French city where lisle fabric was first made. In the 11th century Flemish counts built a chateau here in the midst of a marsh. French *l'isle* is an old spelling for "island."

Lima. Capital of Peru. Spanish corruption of *Rimac*, the name of the river on which it lies. It is Kechua Indian *rimaq*, "talking," hence "noisy."

Limburg. Provinces of Belgium and the Netherlands famous for Limburger cheese. The castle of *Lintburch*, "fortress of the linden tree," gives the modern name.

Limehouse. District of London. There were many limekilns here from medieval times until quite recently. From Old English *lim-ast*, "lime oast or kiln."

Limerick. City and county of Ireland. Irish *Luimneach*, a diminutive form of *lomm*, and meaning "little bare spot of land."

Limoges. French city famous for its porcelain. In ancient Gaul this was the home of the tribe of *Lemovici*, or "warriors of Lemos." The modern name is derived from the tribal name.

Lincoln. Cities in England and Nebraska. The Latin name was *Lindon colonia*, "colony or settlement of Lindon." Lindon is a Celtic name meaning "lake" and refers to the widening of the Witham River here.

Lithuania. Former Baltic state now part of the U.S.S.R. This is a Latinization of Lithuania *Lietuva*, "coastland."

Liverpool. English seaport and towns in New York and Pennsylvania. The name refers to a pool of thick, clotted water.

Lorelei. Rock in the Rhine River on which a siren is supposed to have sat and lured sailors to their destruction. From Middle High German *lure-lei*, "ambush-rock."

Los Angeles. Originally *Reina de los Angeles*, "Queen of the Angels," a name given by the Spanish in honor of Our Lady of the Angels of Portiuncula. The stream on which the city was built was discovered on this feast-day.

Lourdes. French town and shrine. From the Basque *lorr-d-e*, "rocky height extending into space."

Loyola. Castle in Spain where St. Ignatius Loyola was born. From the Basque *lloi-ola*, "muddy place."

Luxembourg. Duchy in Europe and province of Belgium. Formerly *Lutzelburg*, from Old High German *luzzilburh*, "little fortress."

Madeira. Portuguese islands off the coast of Morocco. They are famous for their wines. Early navigators were impressed by the forests of large, unusual trees which they brought back to the King of Portugal. It is the Portuguese word *madeira*, "wood."

Madrid. Capital of Spain. First mentioned as *Magrit*, a name from a north African dialect meaning "aqueduct." There were many aqueducts built here by the Arabs to bring water from the mountains to the dry plains.

Majorca. The largest of the Balearic Islands in the Mediterranean. From the Latin *major*, "older, larger," as opposed to Minorca from the Latin *minor*, "younger, smaller."

Malaga. City in Spain. Founded as a commercial center by the Phoenicians and called by them *Malaka*, "workshop, factory."

Mali. Republic of northwest Africa. The Mandingo tribe called any capital city *Mali*, or "place where the king lives." The name was later extended to their entire empire.

Managua. Capital of Nicaragua. Named after the Barbados cherry tree which grew there. It is a name given by the Arawaks.

Mangalore. City in India. Sanskrit *Mangalapura*, "City of Good Fortune."

Manila. Former capital of the Philippines. Tagalog *ma-nilad*, "place of nilads." The nilad is the plant *Ixora Manila*, a white, blossoming shrub which once grew here in profusion.

Mauna Loa. Semi-active volcano of Hawaii. A native name which means "long mountain."

Mayo. Irish town and county. St. Colman established a monastery here in the 12th century which he called *Magh-eo*, "plain of the yew trees."

Mazatlan. City on the west coast of Mexico. "Place of deer," from the Aztec word *mazatl*, "deer."

Mecca. One of the capital cities of Saudi Arabia. Arabian *Makkah*, "Sanctuary." This holy city of the Moslems is surrounded by an inviolable territory.

Mecklenburg. Former German state and the name of two American counties. *Mikilinburg* was the chief fortress of the Obortites, a Slavonic tribe who succeeded the Teutons in the 6th century. Its name is Germanic, however, and means "large fortress."

Melanesia. One of the three great divisions of the Pacific islands. The name is a Greek formation and means "island of the blacks." The Papuans, who are the prevailing tribe, have very dark skin.

Memphis. Capital of ancient Egypt and largest city in Tennessee. The old name, *Menfi*, is from the Egyptian name of the pyramid of Pepi I, *Men-nefer*. It probably means "his goodness endures."

Menlo Park. Village in New Jersey where Thos. Edison lived, and city in California. From Menlo Castle, Ireland, whose Irish name is *Mion Loch*, "small lake" as contrasted with Lough Corrib.

Menominee. River in Wisconsin. From the name of an Indian tribe which means "wild rice men." They lived mainly on the wild rice found in the lakes and rivers of their country.

Merrimack. River in Massachusetts and New Hampshire. This is a Pennacook Indian name meaning "deep place." The river is navigable as far as Haverhill.

Mesopotamia. Historical region now occupied by modern Iraq. The area between the Tigris and the Euphrates, hence its Greek name meaning "in the middle of the rivers."

Miami. City in Florida. Fontanedo spelled the name *Mayaimi* in 1575 and stated that it meant "very large." It is probably a compound of Choctaw *maiha*, "wide," and *mih*, "it is very." The Laguna de Mayaimi, which gave its name to the city, is now Lake Okeechobee.

Milan. City in northern Italy. Those who imported silks and ribbons from Milan for making hats, etc., were called Milaners; hence our word *millinery*. The Gaulish name was *Mediolanum*, "cleared portion of a wood."

Milwaukee. A Wisconsin river and city at its mouth. From Algonquin Indian *milo-aki*, "good land," referring to the country through which the river flows.

Minneapolis. Largest city in Minnesota. A name formed by adding the Greek word *polis*, "city," to the root of *Minnehaha*, "curling water," the name of the falls which are in the city still.

Mobile. City in Alabama. Name of an Indian tribe. It is probably connected with the Choctaw word *moeli*, "to row, paddle;" hence "the rowers."

Mojave. River and desert in California. Named after the Mojave Indians who lived here. Their name *Hamakhava* referred to the center of tribal activities in the vicinity of the mountains known as the Needles and means "three mountains."

Moluccas. Indonesian islands. The Arabians gave them the name *Jazirat-al-Malik*, "Islands of the Kings." Each island used to have its own king.

Monaco (*mon'ā-kō*). Independent principality in southern France. Originally a Phoenician settlement dedicated to *Melkarth*, "The Solitary One," a god corresponding to the Greek god Herakles. The Greeks later translated this as *Monoikos*, hence the present name.

Mongolia. Region in central Asia. "Land of the Mongols." The name of these people is generally believed to come from the Tartar word *mong*, "brave." The word *mogul* derives from the Persian form of their name.

Monrovia. Capital of Liberia. Named in honor of President James Monroe "as an acknowledgment of important benefits conferred on the Settlement by the present illustrious chief magistrate of the United States," in the words of the founders.

Monterey. City and bay in California. **Monterrey.** City in Mexico. Both named after the Count of Monterrey who was Viceroy of Mexico 1595–1603.

Moose Jaw. City in Saskatchewan. The Moose Jaw River makes a 90-degree turn here resembling the outline of a moose's jawbone.

Mostar. City in Yugoslavia. Serbo-Croatian *most*, "bridge," and *stary*, "old." The Turks built a bridge over the Neretva here in 1556.

Mourne. Mountains in Northern Ireland. Irish *Mughdhorna*, the tribal name of the MacMahons who lived here. They are descendents of the Celtic *Mugdornai*, "wearers of ankle-bands."

Multnomah. County in Oregon. This is the former name of the Willamette River and referred to that part of the river below the falls. It is a corruption of the Chinook *nematlnomag*, "down-river."

Munich. City in West Germany. The German name, *München*, is from the phrase *bei den Mönchen*, "near the monks." The reference is to its proximity to a monastery on the Tegernsee.

Murmansk. Port in the northern U.S.S.R. The name is a Russian corruption of Old Norse *Northmadhr*, "Northmen." It is literally "place of the Northmen," referring to the foundations of the early Vikings.

Muskegon. River and city in Michigan. Chippewa Indian *muskig*, "grassy bog." The course of the river through swamp land. The same Indian word has given us the word *muskeg*.

Mysore. City and state in India. From *Mahisur*, "buffalo town."

Nagasaki. Japanese city. In the latter part of the 12th century the district was given as a fief to Nagasaki Kotaro by the founder of the Kamakura Shogunate Government.

Nanking. Chinese city. "Southern Capital." This was the capital of China from 1928–1949.

Naples. City in Italy. From the Greek *Neapolis*, "New City." This type of name was often given to a place in a new colony.

Natchez. City in Mississippi. This is the name of an extinct Indian tribe who lived in the area. From Caddo Indian *Na'htcha*, "forest, timber-land."

Netherlands. European kingdom. Often called Holland from the name of two of its provinces. The name means "low-lying lands" and much of the country is below sea-level. Belgium and the Netherlands were once called the Low Countries.

Nevis. River and mountain in Scotland and island in the West Indies. A Celtic name meaning "misty, watery river."

Newark. Towns in England and city in New Jersey. Old English *niwe*, "new" and (*ge*)*weorc*, "fortification."

New Guinea. Island in the southwest Pacific. Named by the Spaniard Ynigo Ortiz de Retes in 1545 because he thought the natives resembled the Negroes of Guinea in Africa. Also called **Papua.**

New Orleans. Originally named by its French founders *La Nouvelle Orleans* after a city in France. See *Orleans*.

New Zealand. English form of the Dutch *Nieuw Zeeland*. Tasman gave this name to the islands to commemorate the Dutch province of *Zeeland*, "land reclaimed from the sea."

Niagara. River and falls between Canada and the United States; also two cities named after the falls. From Iroquois *Ongniaahra*, "point of land cut in two." Once a place near Lake Ontario where the wide river cut through the land.

Nice (*nēs*). City on the French Riviera. Founded by the Greeks and called by them *Nikae*, "victory." They won a battle against the coast-dwellers here and erected a defensive bastion in 300 A. D.

Nimes (*nēm*). French city. Originally *Nemausus*, from a Celtic root meaning "holy place, sanctuary." The fabric *denim* was once called *serge de Nimes*, or "serge from Nimes."

Niobrara. River in Nebraska. Corruption of Omaha Indian *ni*, "water" and *bthatha*, "spreading."

Nome. Town in Alaska. When the chart of this area was being drafted, attention was drawn to the fact that the cape here had no name. The notation *? name* was made and this was misread as Nome.

Norway. Old Norse *Norvegr*, "the north-way." This refers to the coastal route used to travel to the northern regions.

Novgorod. City of the U.S.S.R. Russian for "New City."

Nubia. Former kingdom in northeastern Africa. From Egyptian *noub*, "gold." Gold was found here in historical times.

Nunassiaq. Territory of northern Canada. In 1963 the Northwest Territories Council named the eastern part of the Territories *Nunassiaq*, an Eskimo name for "beautiful land."

Nuremberg. The English spelling of Nurnberg, West Germany. From Middle High German *knur*, "rock, cliff or any barren spot of ground."

Nyasaland. Former British protectorate in Africa. Named after Lake Nyasa on which it borders. This is a corruption of the Bantu name Nyanza from the root word *anza*, "body of water."

Oahu. One of the Hawaiian Islands. From a Polynesian word *ahu*, "heap." In this case it refers to a storehouse or place where things gathered were kept in a heap.

Oaxaca. Mexican city and state. Spanish transcription of Nahuatl *Huaxinyacatl*, "place where the guaje trees start to grow."

Oberammergau. Town in Bavaria famous for its Passion Play. "Upper district of the Ammer River."

Odense. City in Denmark. Old Norse *Odin's ve*, "place sacred to the god Odin."

Odessa. City in the Ukrainian S.S.R. Founded as a Russian trading center in 1795 on the site of the Turkish fortress of Hadzhibej. Named in memory of the ancient city of Odessa which was near the present site of Varna, Bulgaria. This name was from the Thracian word *bedu*, "water."

Okefenokee. Swampy region in Georgia. From Hitchiti Indian *oki-finoki*, "shaking water."

Okhotsk. Sea east of Siberia, really an arm of the Pacific. The name of the sea derives from that of the Okhot River which empties into it. The Tungus word *okat* means simply "sea."

Okinawa. Island between Japan and Formosa. The literal meaning of this Japanese name is "rope offshore." It refers to the shape of the long, low island which suggests a knotted rope.

Omaha. City in Nebraska. Commemorates the Omaha Indians whose name is Siouxan for "those going against the current or wind." They once lived on the banks of the Ohio and Wabash rivers, but later migrated up the rivers to the west.

Orense (*ô-rān'sâ*). City of Spain. From the Latin name *Auriensis*, a derivative of *aurum*, "gold." Gold was formerly found there.

Orinoco. River of Venezuela. The Carib Indians made pottery along the banks. This would verify the meaning of "clay river."

Orkney. Islands north of Scotland. A translation of Old Irish *Insi Orc*, "islands of the Uirc tribe." The tribal name means "pigs" and has pagan connotations.

Orleans. City in France. *Aurelianum* was the name given to the ancient Gaulish city of Genabum in honor of Aurelianus, Emperor of Rome, 270–75 A. D.

Osaka. Japanese city. In 1583 the great Japanese warrior, Hideyoshi, built a magnificent castle on a hill here. He called it *O-saka* or "great hill." The name of the castle was later given to the entire city.

Ottawa. Capital of Canada situated on the Ottawa River. The river-name is Iroquois and means "boiling" with reference to its many rapids and falls.

Oxford. City and county in England and town in Mississippi. "Place where the oxen forded the river."

Ozarks. Range of mountains in the Southern States. The French had a custom of shortening long Indian names, thus Arkansas became Ark. The phrase "aux Arks," referred to the range of mountains which lay in the direction of the Arkansas River.

Pakistan. Moslem students in England during the 1930's took the first letters of Punjab, Afghania, Kashmir and Sind, which are all regions of Pakistan, and added the suffix *-stan*, "land."

Palestine. From the name of the Peleshtim or Philistines, one of the tribes of sea peoples who invaded the coastal plain in the 12th century B. C.

Palomar. California mountain which supports a famous observatory. A Spanish name meaning "place of doves."

Panama. Central American Indian word meaning "butterflies." During the migration of butterflies in the summer months the multitudes were so vast that the sky was darkened for days.

Papua. British territory on the island of New Guinea. Portuguese explorers named the aborigines *Papuas* from the Malayan word for "frizzled or curly hair." During World War II, the Australian soldiers in New Guinea called them "fuzzy-wuzzies."

Paris. Name of the French capital and of many American towns. Commemorates the Gaulish tribe of the *Parisii*, "the bold ones."

Passamaquoddy. Bay in Maine. Malecite Indian for "place where pollack abound." The pollack is a fish related to the cod.

Pawtucket. City in Rhode Island. Narragansett Indian for "at the falls on the tidal stream." The Pawtucket Falls on the Blackstone River are here.

Pecs. City in Hungary. Known in ancient times as *Quinque Ecclesiae*, "Five Churches." From Old Slavic *piec*, "five."

Peking. Capital of the People's Republic of China. "Northern Capital," as opposed to Nanking. From 1928 to 1949 the city was known as *Peiping* or "Northern Peace."

Pembroke. Welsh town and county and many towns in America. Old Welsh *pen-brog*, "head of land." It is at the western extremity of Wales.

Pensacola. City in Florida. It is the name of a Muskhogean Indian tribe, who were called by the Choctaws *panshi-okla*, "hair people." Both men and women of the tribe wore their hair long.

Pernambuco. Former name of Recife, city of Brazil. From the Guarani Indian *paranambuku*, "long river."

Persia. Historical name of Iran. Named for the Parsa, an Indo-European people who lived here. Their name probably derives from Sanskrit *parashu*, "battle-axe," and refers to their use of these weapons in battle.

Perth. City in Scotland, Australia, and America. From a Pictish word related to the Welsh word *perth*, "bush, hedge."

Peru. The Spanish heard of a place called Viru by which entrance to the Incan Empire was presumably gained. The name was ultimately given to the entire country in a corrupted form. It is from Kechua Indian *wiru*, a species of South American bamboo.

Phoenicia. Ancient kingdom in vicinity of modern Syria and Israel. Famous for its purple dye industry, the name is from the Greek *phoenix*, "purple."

Platte. River in Nebraska. This is a misspelling of the French word *plate*, "flat." The river is extremely shallow and wide.

Polynesia. Pacific islands. Greek for "many islands."

Pomerania. Former German province on the Baltic; home of the pomeranian dog. Old Slavic *po-morije*, "seacoast."

Pondicherry. City in India, formerly a French dependency. Earlier *Podutscheri*, from Dravidian *podu*, "new," and *tscheri*, "city."

Popocatepetl (*pō-pô-kät'ĕ-pĕt'l*). Mexican volcano. An Aztec name meaning "smoky mountain," referring to its volcanic activity.

Portugal. From *Portucale*, the name given to the region behind the "port of Cale." The name Cale is Celtic and means "shelter."

Potomac. American river. Name of an Algonquin town erroneously applied to the river. It means "where things are brought," probably tributes to a neighboring tribe.

Prague. Capital of Czechoslovakia. An Old Slavic word meaning "clearing burnt by the sun."

Recife (*rĕ-sē'fĕ*). City in Brazil. An enormous reef (Portuguese *recife*) encloses the harbor.

Regina. Capital of Saskatchewan. Honors Queen Victoria, called Victoria Regina in Latin.

Reykjavik (*rā'kyä-vēk'*). Capital of Iceland. Old Norse *reykr-vik*, "smoky bay." The first settlers mistook the clouds of steam from local hotsprings for smoke.

Riga. Capital of Latvia. From Lithuanian *ringa*, "something crooked," with reference to the stream on which the city was built.

Rostock. City in East Germany. Old Slavic *rastok'*, "fork in a river."

Rotorua. Thermal spa in New Zealand. It was the second big lake discovered by the Maori explorer Ihenga, hence its Maori name, "Second Lake."

Rotterdam. City in the Netherlands. Low German for "dam on the Rotte River." Rotte is the river "of duckweed."

Ruhr. German river and valley. Old High German *ruora*, "following with a strong, swift course."

Russia. Swedish tribes living around Kiev were called *Rus*. The name was gradually extended to the whole country.

Santos. City in Brazil. From the Portuguese *Hospital dos Santos*, "Hospital of the Saints." This was a hospital for sailors built in the 16th century.

Saskatoon. City in Saskatchewan. A kind of Juneberry called by the Cree Indians *missaskatoomina* grew here in abundance.

Saxony. Former German kingdom. "Land of the Saxons." The tribal name derives from Old High German *sahso*, "one-edged sword." This was their battle-weapon.

Sedalia. City in Missouri. Named by George R. Smith after his daughter Sarah, whom he called "Sed."

Shanghai. Chinese for "upper sea." Two arms of the sea extended inland at one time and Shanghai was on the upper arm.

Shantung. Chinese province famous for its silk. Chinese *shan*, "mountains" and *tung*, "east." It is the province "east of the mountains" while Shansi is "west of the mountains."

Sheffield. City in England. "Field by the River Sheaf." The *Sheaf* is Old English for "boundary river" and it separates Derbyshire and Yorkshire.

Sorrento. City in Italy. Modern form of Latin *Surrentum* from Greek *Seiren*, "siren or sea-nymph." The city faced the Sea of the Sirens.

Staten Island. Between New Jersey and Long Island. Named *Staaten Eylandt* during the Dutch period in honor of the States (Staaten) General, the governing body of the Netherlands at that time.

Stockholm. Capital of Sweden. Old Norse *stokkr* is the first element of Stocksund, "Sound of stakes or stumps." Stockholm is the *holm*, or island, in Stocksund.

Strasbourg. French city. Formerly *Stratesburg*, "fortress on the Roman street or road."

Sudan. African republic. Arabic *Blad-es-Soudane*, "Country of the Blacks." Originally referred to people not of Semitic stock but later extended to the entire area.

Susquehanna. River in Pennsylvania. Delaware Indian *Assisku-hanne*, "muddy stream."

Sussex. County in England and counties in the U.S. Old English *Suth-Seaxa*, "South Saxons."

Syracuse. Cities in Sicily and New York State. From the Greek *Syrako*, the name of a swamp in Sicily where the Greeks established a colony. It means "sour or brackish water."

Tahoe. Lake between California and Nevada. Corrupted form of the Washoe Indian word for lake, *da'au*.

Tallahassee. City in Florida. Creek Indian *talwa-hasi*, "old town."

Tasco. Mexican town and art colony. The name is related to the native word *tlachtli*, "ball." The place was once consecrated to the ritual games of the Aztecs.

Thames. River in England and rivers in North America. A British river-name, formerly *Tamesis*, "dark river."

Ticonderoga. Fort and town in New York State. Lake George empties into Lake Champlain here, hence the Mohawk name "where two currents join."

Timor. Indonesian island. Malayan word for "east." Timor is the most easterly of the Sunda Islands.

Tirana. Capital of Albania. Founded in the early 17th century by the Turks and named after Teheran, Persia, after a Turkish victory there.

Titicaca. Lake in Bolivia. Kechua Indian *titi*, "lead," and *gaga*, "rock." The name was originally applied to the rocks which surround the lake.

Tobruk. Town in Libya. Arabic pronunciation of the Greek *Antipyrgos*, "opposite the rock." A firm rock in the harbor protected ships from the east wind.

Tokyo. City in Japan. "New Capital." Kyoto was the the "Old Capital."

Toronto. City in Ontario. An Iroquois name meaning "tree or stump projecting out of the water."

Transvaal. Province of the Republic of South Africa. Named by the Boers when they settled "across the Vaal River." *Vaal* is Dutch for "yellow."

Tripoli. Capital of Libya. A union of three ancient cities called Oea, Leptis Magna, and Sabata. Greek for "three cities."

Tucson. City in Arizona. Derived from the Papago Indian name of *Tuqui-son*, "black-based." The base of the Sentinel Mountains here is darker in color than the summit.

Tunis. Capital of Tunisia, Africa. The Berber root *ENS*, "to sleep" suggests that this was once a place for passing the night; an encampment.

Turkey. "The country of the Turks." These people were originally inhabitants of Mongolia and received their name from living near a hill called *Turku*, "helmet." The hill was helmet-shaped.

Tuskegee. City in Alabama. From the name of a Muskhogean tribe. They were "warriors" and Creek Indian word for warriors, *taskialgi*, is related.

Ukraine. Part of the U.S.S.R. From the Slavic *ukrai*, "on the edge," hence "boundary." This territory separated the Poles from the Mongolian Tartars.

Vaduz. Capital of Liechenstein. Formerly *Valdulz*, from *Vallis Dulcis*, which is Latin for "Sweet Valley."

Valparaiso. Seaport in Chile. Spanish for "valley of paradise," referring to the beautiful situation and lush plant growth.

Vancouver. Cities in Washington State and British Columbia and island off British Columbia. Named after Capt. George Vancouver, an English navigator who explored this coast 1792–94.

Venezuela. South American republic. When Spanish explorers saw the native huts built on pilings off Maracaibo, they were reminded of the city of Venice, Italy, and gave the name *Venezuela*, which is Spanish for "Little Venice."

Waco. City in Texas. Named after the Waco Indians. Their name was originally *Wehiku*, a corruption of Mexico, and they were so-called because they were always fighting the Mexicans.

Waikiki. Beach at Honolulu. Hawaiian for "spouting water."

Wichita. City in Kansas. From an Indian tribe of that name which means simply "the men."

Winchester. City in England and many places in America. Earlier *Ventacestre*, Old English for "fort on the Venta River." *Venta* is a Celtic river-name meaning "smiling, pleasant."

Windsor. Town in England and city in Ontario. Old English *Windlesora*, "windlass-shore." This was a landing-place with a windlass for pulling the boats up the river-bank.

Winnebago. Wisconsin lake. The name signifies "dirty, stinking water," in the Fox and Sauk Indian languages. The English called the Winnebago Indians "The Stinkards.'

Winnipeg. Capital of Manitoba. The name is Cree Indian *win*, "dirty" and *nipi*, "water." The reference is to the waters of Lake Winnipeg which lies to the north.

Yemen. Independent kingdom in Arabia. From the Arabic *yaman*, "to the right-hand." Yemen is on the right side of the region of Hejaz, while Syria is on the left or north side.

Yokohama. City and seaport of Japan. Japanese for "sheltered beach."

York. City and county of England; hence New York. In the year 730 the name was *Eburacum* which is Celtic for "place of the yew tree." Later the Old English word *wic*, "village" was added and finally the Scandinavians contracted the name to its present form.

Yosemite. National park in California. This is a name which was given to a band of renegades from various tribes who once lived here. In the local Indian dialect it means "killers."

Yugoslavia. The name of this European republic is Serbo-Croatian for "South Slavs," as distinguished from East and West Slavs to the north.

Yuma. Town in Arizona. The Yuma tribe received their name from their habit of making huge fires to induce rain. It derives from the Spanish *umo*, "smoke."

Zaragoza. City in Spain; often spelled *Saragossa*. An Iberian city which received the name *Caesaraugusta* in 27 B. C. in honor of that emperor. Zaragoza is an Arabic corruption.

REVIEW QUESTIONS

Give the derivation of the word geography. State the name and the subject matter of each of the principal divisions into which the science of geography is classified 49

Characterize the three chief periods of geographical progress 49

Name one of the founders of the science of geography 49

Give two reasons based on climate for the superior state of civilization in the temperate zones . 49

State four benefits that may be derived from the study of geography 49–50

Who were the earliest navigators known to history? Name a notable discovery made by each of them 51

Mention six Greek geographers and state the chief contributions made by each to the science of geography 51

What conception of the world's shape prevailed in Europe during the middle ages? How was the geographical knowledge possessed by the Greeks transmitted to Western Europe? . . 51

What chief discovery was made by each of the following men: Marco Polo, Vasco da Gama, Captain Cook, McClure, Nordenskjöld, Peary, and Amundsen? 51–52

What is meant by the poles of the earth? Contrast the character of the earth's surface at the north pole with that at the south pole . 53

Of what use are circles of latitude and of longitude? How does a degree of latitude differ in length from a degree of longitude? 53

What is the cause of the alternation of day and night? of the difference in length of day at different seasons? 53–54

Explain how an observer may tell in what zone he is by observing the noonday position of the sun throughout the year 54

NORTH AMERICA

To what part of the earth is the name America applied? In whose honor was it so named? Explain the use of the term New World . . 55

Give the north-and-south length of America. How near does America approach to the north pole? to the south pole? 55

Compare North America and South America as regards shape and climate. Name prominent features common to both continents 55

What oceans and other bodies of salt water border the shores of North America? Describe the character of the North American coasts. On which coast are the harbors most numerous? 55

What great mountain systems form the chief surface features of the North American continent? Locate these systems and indicate the extent of each. Name the highest mountain peak in North America 55

Describe the Great Basin, the Colorado plateau, the Mexican plateau. What noted valley lies in the Mexican plateau? 55

Give the location and extent of the Medial plains. By what important river systems are these plains drained? 56

In what part of the continent are volcanoes found? Name one or more active volcanoes in Central America, in Mexico, in the United States, in Alaska 56

Describe in general the climate of North America. Characterize the climate of Central America; of Mexico; of the Great Plains. Where, in North America, is the region of greatest rainfall? of least rainfall? 56

State the rank of North America among the continents in respect to mineral wealth. Name 10 important mineral products of this continent. 56

Indicate the extent and the general character of North American forests. In what respect are the trees of the Pacific slope remarkable? . 56–57

Compare the bird and animal life of North America with that of Europe and Asia. Name several birds and larger animals characteristic of North America 57

State the chief facts about Hudson bay, mentioning its location, its size, the character of its waters, shores, and tributary rivers. Describe its fisheries and fur trade, and point out its commercial importance 57

Name and describe the Great Lakes, in the order of size, giving outlets and connections. State the commercial importance of the Great Lakes, naming the largest port on each . . 58

THE UNITED STATES

State the location of the United States, naming the countries and the oceans between which it lies. Describe briefly the character of the Atlantic coast; of the coast of the Gulf of Mexico; of the Pacific coast 59

What mountain system extends along the Atlantic side of the United States? along the western side? Where is the Great Basin located? the Columbia River plateau? . . . 59

Name the chief drainage basins of the United States. Into what oceans, seas, or gulfs do their drainage waters flow? How large a part of the United States lies in the Mississippi basin? Estimate the agricultural importance of this region 59

Describe in general the climate of the United States. Where do the greatest extremes of heat and cold occur? Where are the regions of greatest rainfall? 59–60

Discuss the mineral wealth of the United States, naming several important minerals produced. In what parts of the United States are extensive forests found? Name several important forest trees 60–61

Mention some of the larger native animals of the United States. Name six well-known song birds; six highly prized game birds; eight valuable food and game fishes 61

State the rank of the United States in manufactures among the countries of the world. Give reasons for its position 61

Locate the northernmost point in the United States; the easternmost; the southernmost; the westernmost. Where is the geographic center of the country? Indicate the location of the center of population 61

Locate the following national parks and mention a prominent feature of each: Glacier, Lassen Volcanic, Rocky Mountain, Mount Rainier, and Sequoia 62

New England States

Locate the group of New England states and give their names. To what single western state are they nearly equal in total area? Compare them with that state in respect to population 65

Describe the surface, the rivers, and the climate of the New England states 65

What are the chief mineral productions of these states? Which of these states leads in the value of quarry products? 65

Describe briefly the fisheries of New England. Which state stands first in value of sea fish taken? 65

What is the leading occupation of the people of New England? Mention ten important products of New England factories. Give four reasons for the success of New England as a manufacturing region. Compare Massachusetts with other states of the Union with respect to manufactures and commerce . . 66

Describe the commerce of the New England states. Name five leading New England seaports 66

Middle Atlantic States

Name the states usually called the Middle Atlantic states. Which of these are sometimes called the Middle states? 66

What fraction of the total area of the United States do the Middle Atlantic states embrace? what proportion of the total population? of the total manufacturing capital? of the total number of wage-earners? 66

Describe in general the surface of the Middle Atlantic states. Through what part of this group does the Appalachian Mountain system extend? Describe the coastal plain. Name four important tidal rivers found in this group. What large river on the west serves as an interior waterway? 66

State in general the climate of the Middle Atlantic states. To what influence does the fruit belt of western New York owe its favorable climate? 66

In what does the mineral wealth of the Middle Atlantic states consist? Where and when was petroleum first discovered? In what manufactures do these states, by reason of their mineral resources, lead all other states? . . 66

Describe the development of agriculture in the Middle Atlantic states. Name the leading agricultural products. What state pays special attention to dairying? In what state do peanuts and tobacco form an important crop? 66

Name the most valuable single product of the salt-water fisheries of the Middle Atlantic states 66

Give two reasons for the commercial supremacy of the Middle Atlantic states. In what respects does the state of New York rank first among the states of the Union? What important waterway connects the Hudson river with the Great Lakes? 66

Central States

Name the states included in the division called the Central states. Describe the character of their surface and the nature of their soil . 67

By what river systems are the Central states chiefly drained? Name some important navigable rivers. Describe the climate and rainfall of the Central states 67

Compare this group of states, as regards mineral wealth, with other parts of the United States. In which of these states is coal mined? iron ore? In which are petroleum and salt obtained? 67

State the importance of the Central states as an agricultural region. Name the principal crops produced. What state leads in the production of tobacco? What state leads in production of sugar beets? 67

Name the principal farm animals raised in the Central states. What proportion of the country's wool clip is produced in these states? . 67

In what article of manufacture do the Central states lead the world? Name other important manufactures. In which of the Central states is the manufacture of iron and steel chiefly centered? 67

What proportion of the railway mileage of the country is located in the Central states? Name the rivers and lakes that form important inland waterways 67

Southern States

Give the boundaries, extent, and area of the Southern states. What proportion of the total area of the United States do these states form? 68

Name the states comprised in the eastern section of this group; in the western section. Describe the surface of each section 68

Summarize the chief features of the climate of the Southern states. Which parts receive the heaviest rainfall? the lightest rainfall? . . . 68

Describe the forests of each section of the Southern states. Compare these forests with those of other parts of the United States. 68

Name the principal mineral deposits found in the eastern section; in the western section. What important minerals are found in Alabama and in Tennessee? in Florida? Indicate the leading state or states in the production of petroleum and natural gas; of sulphur; of rock salt 68

State the chief occupation of the people of the Southern states. What is the most valuable crop produced in the Southern states? What fruits does southern Florida produce? Which of the Southern states leads in cotton growing? in sugar production? in cattle raising? in wool production? 68

Estimate the importance of stock raising in the eastern section; in the western. Name the chief animal products of each section . . . 68

State the principal manufactures of the eastern section. Name the three states which lead in manufactures. Which states in this group lead in the manufacture of iron and steel? of cotton goods? of tobacco? 68

What are the chief manufactures of the western section? Which of these states leads in manufactures? 68

What are the chief articles of export of the Southern states? Name the principal seaports of each section 68–69

Plateau States

Name the Plateau states. Describe their surface. Which state has the highest elevation above sea level? the lowest? Which contains the highest mountains? 69

By what drainage systems are the states in this division drained? Name four important rivers in each system 69

Describe the climate of the different parts of this region, stating reasons for the great diversity. Which parts are hottest? which are coldest? Why does each of these states contain tracts of desert? Describe these desert areas 69

In what locations are the forests in these states found? Of what trees do they chiefly consist? How many national forests are located in these states? State their total area 69

State the chief mineral productions of this region. Name the states which lead in the production of gold; of silver; of copper; of tungsten 69–70

By what methods is agriculture carried on in the Plateau states? What are the chief crops produced? In what states or sections are apples grown? melons? long staple cotton? . 70

State the importance of stock raising in these states. Name the most important animals reared. What proportion of the total wool clip of the United States do these states produce? 70

Contiguous Pacific States

Name the states which form the contiguous portion of this group. Describe in general their surface. Name and locate three important mountain ranges. Mention five important valleys noted for their fertility 71

Name the chief navigable rivers of the contiguous Pacific states. Name three important uses of the rivers of these states 71

Describe the climate of the contiguous Pacific states, giving its chief characteristics. What sections receive the greatest rainfall? . . . 71

Name important mineral products of these states. Indicate the present rank of California among the states in gold production . 71

For what characteristics are the forests of these states noted? In which of the states is the most important lumber region located? . 77
State the importance of agriculture in these states. Mention leading crops. What class of crops outranks all others in value? . . . 77
Which of these states leads in fruit production? Of what classes of fruits does this state's production chiefly consist? In what district are citrus fruits extensively grown? Of what three kinds of fruits does this production principally consist? 77
Discuss the value and extent of irrigation in the contiguous Pacific states. What is the position of California as regards irrigation? . . . 77
Where are the principal fishing grounds? Name the most important food fish taken. . 77
Point out factors that have stimulated manufacturing in the contiguous Pacific states. Name the chief classes of manufactured products. Describe the commerce of these states. Indicate the value of the Panama canal to this region 77

Alaska, Hawaii, U.S. Dependencies

Locate and give the extent of Alaska. Describe the chief surface divisions of the mainland. Describe also the principal river. 77–78
List Alaska's principa volcanoes, glaciers, straits, canals and other points of scenic interest, including her largest mountain. What special characteristic distinguishes the Muir glacier? What is the "Valley of Ten Thousand Smokes?" 78
According to climate, into what principal districts is Alaska divided? What varieties of vegetation and animal life are found in these different regions? 79
Name the chief mineral products of Alaska. State the value of its fisheries. What parts of Alaska does the government railway connect? Sketch briefly the history of Alaska 79
Briefly describe Hawaii, mentioning location, extent, surface, soil, and climate. Name the capital. What are the chief productions of Hawaii? Outline its history 81
Describe American Samoa. Name its chief seaport. Locate and give important points about Guam 83
Name the dependencies of the United States. 82
Locate Puerto Rico. Briefly describe its surface, climate, vegetation, and soil. Name the principal industry and products of the island. What city is the capital? Name three other important cities. Outline the history of Puerto Rico 83
Briefly describe the Virgin islands. Sketch their history. In what does the chief value of the Virgin islands now consist? 84

DICTIONARY OF AMERICAN GEOGRAPHY

What noted features of travel interest are situated near Adamana? Describe them briefly. State the chief industry of Akron, O.; give reasons for the city's growth 85
Describe briefly the city of Albany, mentioning noteworthy features. What widely known educational institution is located at Annapolis? at Ann Arbor? at Athens, Georgia? . 85–86
Of what state is Augusta the capital? Austin? Compare these cities with respect to manufactures and commerce. Briefly describe Baltimore. State its rank in population and give reasons for its industrial and commercial prominence 87–88
Locate and describe Black Rock desert, Blue-Grass Region. For whom was Berkeley named? For what is the city noted? State the chief industries of Bayonne; of Beaumont; of Bethlehem; of Binghamton; of Birmingham 88–89
Briefly describe Boston, giving important points regarding its site, parks, monuments, buildings, and educational institutions. State its rank in population, in manufactures, and as a seaport. Mention features of historic and literary interest. Outline the history of the city. 89–90
In what manufacture does Brockton rank high among American cities? What are the chief manufactures of Bridgeport? 90
Give a brief description of Buffalo, covering important features. State its rank in population; in manufactures. What great commercial advantages does the city possess? Near what celebrated point of interest is it located? 90
Locate and give points of travel or other interest regarding Carlsbad Cave, Casa Grande, Castle Gate, and Lake Champlain. Of what importance is Cambridge? Locate and describe Charleston, South Carolina 91–92
Describe in brief the city of Chicago, giving chief points regarding its site, area, streets, parks, and buildings. State the rank of the city in population, in manufactures, in commerce, and as a railway center. To what advantages does Chicago largely owe its commanding position? Give six important events in the history of Chicago 93
Where is Cincinnati located? Describe its site. Mention fine residence districts, parks, buildings. Name its leading manufactures. . . . 94
Locate and describe the city of Cleveland. State its rank in population and in manufactures. Of what does its civic center consist? With what are the city's chief industries concerned? Point out factors which have greatly aided the city's growth 94–95
Name points of interest in the vicinity of Colorado Springs. Describe the Columbia River highway. For what is Concord, Mass., noted? What and where is the Continental Divide? 95–96
Describe the Corn Belt; the Cotton Belt. . . . 96
Briefly describe Detroit. State its rank in population and manufactures. Of what great industry is it the world center? Of what importance is the lake traffic of Duluth? What are the chief manufactures of Elizabeth? of El Paso? 97–99
For what special industry is Fresno noted? Gary? Gloucester? Gloversville? Of what political importance is Frankfort? Harrisburg? Hartford? Where is the Grand Canyon? Describe some of its principal features. For what historic associations is Gettysburg widely known? Harpers Ferry? Hodgenville? 100–103
Describe Honolulu. Of what races and nationalities is its population composed? Where and of what importance is Houston? Locate and describe the Imperial valley. What is the Inland Empire? Briefly describe Indianapolis, giving important points regarding its commerce and industries. Mention factors aiding its development 103–104
Describe and give the commercial importance of Kansas City, Mo., and Kansas City, Kans. Of what great industries do these cities form a leading center? For what is Key West remarkable? 105–106
Trace the route of the Lincoln highway. For what is Lookout mountain noted? Of what political importance is Lincoln, Nebr.? Little Rock? 107
Briefly describe Los Angeles. State its rank in population, in manufactures, in commerce. Mention factors which have contributed to its growth. Name notable features and places of interest in its vicinity. State the commercial importance of Louisville. For what product is the city a leading market? 107–108

Locate and briefly describe Madison. For what is the city mainly important? Of what production is Memphis the chief center in the United States? State the rank of Milwaukee in manufactures. Briefly describe its site, harbor, parks, buildings, manufactures, commerce 109–110

Give a short description of Minneapolis. In the manufacture of what product is it a leader among American cities? Locate and describe the Mojave desert. For what historic associations is Monterey noted? 110–111

Why are Monticello and Mount Vernon, Virginia, places of national interest? Mention important points concerning Moundsville, Mount Clemens, Mount Rubidoux, Mount Tom, Muscle Shoals 111–112

In what manufacture does New Bedford lead? Of what commercial importance is New Orleans? 112–113

In what characteristics of its buildings does New York excel other cities? What are the chief means of transportation within the city? Describe the harbor and its connections by water and by rail. Discuss the rank of New York in commerce, in finance, in manufactures. Give reasons for the city's supremacy. 113–115

Locate and describe briefly Niagara falls. What important industries are located at the city of Niagara Falls? By what means is the power of the cataract transformed into electric power? Name cities to which this electric power is distributed 115

Locate Philadelphia. Describe its site and street plan. Mention important public edifices and commercial buildings. Name and locate the city's most famous historic landmark 117–118

On what rivers is Pittsburgh located? State its chief industries. In what manufactures does it lead? Give reasons for the city's industrial prominence 119–120

For what is Pittsfield noted? Plymouth? Port Arthur? Portland, Maine? Portland, Oregon? 120

Locate and compare three cities named Portsmouth. Name an important educational institution at Poughkeepsie; at Princeton; at Providence 120–122

For what historic associations is Portsmouth, N. H., noted? Quincy, Mass.? Richmond, Va.? 120–122

Briefly describe Saint Louis. Discuss its commercial importance. State its rank as a manufacturing center. Name leading industries. Sketch the city's history 123–124

What is the standing of Saint Paul as a wholesale center? Mention historic associations of Salem, Mass. Describe Salt Lake City . 124–125

Describe the site and harbor of San Francisco. What is the Golden Gate? State the importance of San Francisco in commerce, in finance, in manufactures. Mention features of scenic or historic interest 125–126

State the rank of Seattle in commerce and manufactures. Give reasons for the city's importance. In what lines does Shreveport lead? Sioux City? South Bend? 127–128

Locate and compare briefly four cities named Springfield. For what is Starved Rock noted? Stone mountain? 128–129

Describe Syracuse as a manufacturing center. Mention factors which have aided the city's growth. Locate and name features of interest regarding Lake Tahoe; Mount Tamalpais; Thousand Islands; Ticonderoga . . . 129–130

For what special product is Trenton noted? Troy? Tulsa? Utica? Waltham? Give points of historic interest regarding Trenton, Valley Forge, Vicksburg 130–131

By whom was the city of Washington planned? How were these plans finally carried out? with what result? Name four of the most noted public buildings. Describe the Washington monument; the Lincoln memorial . . 131

Locate and briefly describe Mount Washington; Watkins Glen; Mount Whitney, Mount Wilson 132–133

Of what industry was Wilkes-Barre the birthplace? Locate the Wheat Belt. Of what manufacture is Winston-Salem the leading center? 132–134

Locate Yellowstone park. Name and briefly describe its chief scenic features. Where is Yosemite park? What remarkable scenic attractions does it contain? Describe its waterfalls; its big trees 134–136

Where and what is Zuñi? Compare it with Laguna, Walpi 136, 106, 131

CANADA

Is the area of Canada greater or less than that of the United States? How far does Canada extend east and west? how far north and south? 141

Into what five natural divisions may the surface of Canada be divided? Characterize each briefly 141

How does the climate of the interior plains of Canada differ in temperature and in rainfall from the climate of British Columbia? Describe the climate of the arctic region in Canada 143

What are the four chief drainage basins of Canada? Name the chief rivers belonging to each basin 143

Indicate the approximate extent and location of the different vegetation areas in Canada . . 143

What are the three chief forest areas of Canada? What kind of timber is obtained from each? What steps have been taken by the government to preserve the forests? Where is the principal market for Canadian forest products? 143

Name 20 animals commonly found in Canada; one animal distinctive of the Canadian fauna; the animal which is a national emblem of Canada 143

Indicate the location and extent of land in Canada suitable for agriculture. How much of it is under field crops? 144

Name in order the four cities of Canada which rank highest as industrial centers 144

Mention distinctive features of Canada's railroad system; language conditions 144

Provinces

Mention a distinctive feature of the climate of Alberta. What recent trend is noticeable in the province's agricultural industry? What minerals are found in Alberta? 145

What are the two chief industries of British Columbia? 146

Describe the conditions of soil and of climate which make Manitoba an important wheat growing region 147

What are the three principal industries of New Brunswick? 147

State the area of Nova Scotia, its population, and the length of its coast line. Name a large island and a productive fruit district of the province. Where are its richest coal mines? province. Where are its richest coal mines?. 148

How does Ontario rank with other Canadian provinces in each of the following respects: population, wealth, mineral production, value of field crops, output of dairy products, lumbering, and manufactures? 149

What is the maximum elevation of Prince Edward Island? What distinctive industry has recently become important there? 149
Give the boundaries of Quebec. Mention an important factor influencing its climate. Name a distinctive mineral obtained in the province. Discuss Quebec's rank among the Canadian provinces in forest products and manufactures. What is the predominant religion and the language of Quebec? . 149–150
Describe the climate of Saskatchewan. What is the most important product? 150
Name the highest mountain in the Yukon. State the approximate value of gold which has been obtained from the territory 150

Cities and Points of Travel Interest

Name three lakes of great scenic beauty in the vicinity of Banff. 151
What are the leading industries of Brantford? of Calgary? of Charlottetown? 151
Where is Churchill? For what reason is it notable? 151
Locate Edmonton, Fort William, and Halifax. For what is Cobalt noted? Dawson? . .151–152
State reasons for Hamilton's growth as a manufacturing city. 152
Discuss Kingston from the point of view of transportation, education, and historical associations 152
Name two respects in which Montreal exceeds in importance any other city of Canada. Specify two notable examples of engineering skill, three squares, and two great buildings of Montreal 152
For what are the following places chiefly noted: Hull, New Westminster, Niagara Falls, Oshawa? 152–153
How large is Muskoka? What provincial park lies near it? 153
When was Ottawa made the capital of Canada? Mention an outstanding scenic feature near the city. Name six buildings of note. What is the chief industry? 153
Describe Quebec under the heads of location, history, industries, great buildings, and educational institutions 153–154
For what is Sainte Anne de Beaupré noted? . 154
What is the distinctive industry of each of the following places: Sherbrooke, Sudbury, Sydney, Thetford Mines, and Three Rivers? . . 154
For what institution is Stratford best known? On what river is the city situated? 154
How does Toronto rank among the cities of Canada in each of the following: industry, commerce, and finance? What distinctive annual institution has Toronto? 154–155
What are the leading industries of Vancouver? Name the principal park of Vancouver; the chief recreation ground of Victoria. 155
What is the most southerly city of Canada? . 155
Show how Winnipeg's location is favorable to its growth. Mention the city's outstanding edifice, the largest park, and a distinctive feature of the municipal supply service 155

MEXICO, CENTRAL AMERICA, AND WEST INDIES

How much of Mexico is in the Torrid Zone? What is the length of the country? its greatest and its least width? 156
What name is applied to the portion of Mexico between 3000 and 8000 feet elevation? to that above 8000 feet? Name the chief mountain ranges and volcanoes. Give 10 products of Mexico's agriculture or forestry 156
State the reasons for saying that Mexico is potentially one of the richest mineral producing countries in the world. What are the chief manufactured products? 156
Give the names of the two largest cities of Mexico. Describe the situation of Mexico City. For what is its museum famous? What three notable features are there in the vicinity of the city? 157
Describe Central America under the heads of mountains, climate, and inhabitants 157
Who named Costa Rica? What are the staple products of Costa Rica? of Guatemala? 157–158
Name the chief article of domestic consumption in Honduras; a distinctive fact regarding its capital; the largest lake in Central America; and the volcano of Salvador that has risen one mile in height in the past century 158
What are the chief exports of Belize? of Managua? Why is the cathedral of Guatemala noteworthy? Give interesting historical facts about San Salvador and Tegucigalpa . .157–159
Explain the meaning of the terms British West Indies, Greater Antilles, Lesser Antilles. What is the origin of the name Antilles? . . 159
What is the prevailing racial strain in the population of each of the following islands or island groups: Bahama, Leeward, Cuba, and Haiti? 159–160
Mention distinctive features of the rivers and of the fauna of Cuba. What is Cuba's outstanding economic interest? What language is spoken in Cuba? in the republic of Haiti? Name five cities of Cuba 160

SOUTH AMERICA

Compare South America with North America in regard to location, area, coast line, and western mountain system 161
Name the three great plains of South America; the three greatest rivers. What is the most southerly point of the continent? 161
Where are the most arid parts of the continent? What part has the greatest rainfall? 161
Give the names of four important economic plants which flourish in South America; ten characteristic species of animals native there. 161
Name three distinctive mineral products of South America. What countries have a population predominately of the white race? of pure-blooded Indians? What is the prevailing religion? the most widespread language? 161
What are the two highest peaks of the Andes mountains? four volcanoes in this range? For what is Lake Titicaca remarkable? . . . 162
Name the chief tributaries of the Amazon river; of the Plata-Parana River system; of the Orinoco river 162
What is the maximum range of temperature recorded in Argentina? For what economic products is the country noted? Mention two respects in which Argentina leads all other South American countries 162
Specify four of the highest mountains of Bolivia. Discuss the mining and transportation difficulties of Bolivia. What are the chief minerals produced? 162–163
State the area, chief products, and population of Brazil. Describe its climate. Name a notable gold mine of Brazil 162
Give a distinctive mineral product of Chile; of Colombia; two distinctive products of Ecuador. Name and locate the highest active volcano in the world 163–164
What are the chief exports of Paraguay? three distinctive products of Peru? State the principal industry of Uruguay; the origin of the name Venezuela 165–166

Name the largest city of South America. Describe the city's principal avenue. Mention interesting features of Easter island, Galapagos islands, Juan Fernandez island, and Santos. What city of South America was recently built as a national capital? 167–168

EUROPE

State the boundaries of Europe. Compare the continent's area with that of the United States. What is the most noticeable characteristic of Europe's coast line? How has this feature proved advantageous for settlement? Name the principal islands of Europe . . . 169

Describe two changes of elevation that have occurred in parts of Europe within historical times. Name six mountain ranges of southern Europe; four plains of the continent. What are the chief volcanic regions? 169

Specify the four longest rivers of Europe. Into what body of water does each empty? What are the two largest lakes of Europe? 169

Account for the warm climate on Europe's northern coast; for the absence of deserts in Europe 169

Name 16 cultivated plants and 5 animals the original habitats of which were in Europe . 169

Indicate the chief areas of Europe which produce each of the following minerals: coal, iron, zinc, platinum, and quicksilver 169

What are the principal mammals found on the continent of Europe? Which domesticated animals originated there? 169

How does Europe's industrial output compare with that of other continents? Account for the concentration of her industries in a few areas 169

Mention five products which European countries export in substantial amounts to countries in other continents 169

What basis is there for the saying that Europe is a collection of small, stubbornly independent states? Give some examples of these autonomous countries 169

Bound Austria. What is her latest estimated area and population? On what industries do the inhabitants depend chiefly for support? 169

Countries

What is the density of Belgium's population? Name the chief manufactures; the most celebrated university. Indicate a peculiarity of the racial and linguistic conditions of Belgium 170–171

Give the boundaries of Bulgaria. Name a distinctive product of Bulgaria; the chief waterway; the prevailing religion; the three largest cities 171

Describe the political relation of Denmark to the Faroe islands; to Greenland. Characterize the agricultural industry of Denmark. Specify a change in Denmark's territory occasioned by World War I 171

State the boundaries of France. How does the character of the coast and of the rivers affect the location of French ports? Name the highest mountain of France; the leading minerals produced; the principal manufactures. What is the prevailing religion of France? the most notable university? .171–172

Give the names of a high mountain in Germany; five rivers; five minerals obtained; the two leading field crops; two products for which German industry has shown special aptitude 173

How high is Gibraltar? Describe a memorable siege which it endured 174

Distinguish between Great Britain as a geographical entity and as a political division. Name the principal coastal indentations of Great Britain. What benefits accrue to Great Britain from the shallowness of the surrounding seas? 174

Name the chief rivers of England; the largest lake; the highest mountain. Discuss the rank of England among European countries in coal exporting, iron production, shipbuilding, and the manufacture of cutlery and of textiles. Name the four largest cities . . 174–175

What is the chief economic interest of Wales?. 175

Into what three parts may Scotland be divided by the nature of its surface? Where is the densest population? What are the chief industries? the leading crop? the established religion? the four largest cities? 175

Specify the largest island of Greece; the ancient and the modern name of the chief peninsula; the largest mountain range; a notable drainage project; and a distinctive product. Describe the climate of Greece 175–176

Give the boundaries of Hungary. Why are the people sometimes called Magyars? 176

Describe and locate Hecla and the Great Geyser 176

How many people emigrated from Ireland since 1850? Approximately what percentage of the inhabitants can speak the Irish language? What is the island's longest river? a district which attracts numerous tourists? Give a reason for Ireland's designation as the "emerald isle" 176

Contrast Eire with Northern Ireland in regard to economic interests and religion 176

State the boundaries of Italy; two notable rivers of the country; the leading industry; two dist nctive artistic products 177

Mention a method by which many Italian city dwellers combine city and country life. What two disastrous earthquakes have visited Italy in modern times? 177

Why is the Netherlands sometimes called Holland? Characterize the surface of the country. Describe the formation and the reclamation of the former Zuider Zee. Indicate the country's canal mileage, three distinctive products, a breed of cattle developed there, a chief source of raw material for the industries, and the seat of government . . . 178

Mention a distinctive attraction for tourists in Norway. What are the chief occupations of the inhabitants? 178

Specify three characteristic products of Portugal. Mention a noteworthy political fact concerning the country 178

State the boundaries of Rumania; the chief exports; the predominant religion 178

How much of the Danube river lies in Rumania? Give the name of one of its large tributaries. 178

Name and locate the highest mountain in Russia. Name the constituent republics of the Soviet Union. What is the principal watershed in Russia, and what rivers of southern drainage rise from it? Describe some of the measures taken by the Soviet government to bring about the industrialization of the country. From what is Russian caviar made? Specify the chief minerals produced . . 179–180

Characterize the surface of Spain. Name six rivers of the country. Which ones are navigable? What are the principal economic values of the plateaus in Spain? Where is Andalusia? What does it produce? Name two distinctive products of Spain. Describe the mineral wealth of the country 180

Name four great lakes of Sweden. Characterize the three principal divisions of the country. Specify three important industries; the three principal cities 180–181

Describe the surface and drainage of Switzerland. Name five notable mountains. Discuss avalanches in Switzerland, stating their cause

and some precautions taken against loss due to them. Mention a famous tunnel of Switzerland; the chief industries; three distinctive products. What characteristics distinguish a Swiss chalet? 181

Describe the surface of Yugoslavia. What is the Iron Gate? How much of the country's area is forested? What are the three chief religions of the inhabitants? 181

Cities and other Points of Travel Interest

Name five glacial lakes in the Alps mountains. State an important item of interest concerning each of the following places: Amiens, Arcadia, Argonne forest. In what industry does Amsterdam lead the world? How long is the Appian way? 182

Give the names of two important squares in the city of Athens; the four ancient edifices on the Acropolis. Specify an important fact regarding Mount Athos; Avignon; Belleau woods 183

What is the most famous boulevard of Berlin? Mention a great park, six important buildings, and 10 industries of Berlin. . . . 183–184

State the origin of the name Berne. Mention an interesting fact concerning Bingen. What is the chief industry of Birmingham? of Bradford? of Brest? 184

Name a famous ship which was built at Bristol. Specify two important industries of Budapest. When was Cadiz founded? State an important point of interest regarding each of the following: Calais, Cambrai, Canterbury, Cantigny, Capri, Cardiff, Carrara 185

What American state was named after one of the Channel islands? Indicate at least one interesting fact regarding Chateau Thierry; Chemnitz; Cherbourg. Describe briefly Cologne cathedral 186

Name the chief museum of Copenhagen; the founder of Cork; the principal art gallery of Dresden; the finest public garden of Düsseldorf; a thoroughfare of Edinburgh . . . 186–187

Describe Fingal's cave. Discuss Florence as an art center. Mention some of the literary and historical associations of Frankfort and important religious and political associations of Geneva; a sculptural group in Genoa. . 187–188

State at least one outstanding fact regarding Hammerfest. Indicate the chief commercial interest of Hanover; of Le Havre 189

Explain the terms Stamboul, Sublime Porte, Golden Horn, Byzantium, Galata, and Pera. Name the two greatest mosques of Istanbul 189

What great philosopher lived at Königsberg. Name the two chief industries of Leeds; the principal manufacture of Limoges . . . 189–190

Who founded Leningrad? 190

Name the three divisions of Greater London; eight important streets of London; three parks or pleasure grounds; ten famous buildings of the city. For what is Lourdes noted? 191–192

Describe the "Lion of Lucerne" and the Maelstrom. What is the largest industry of Lyon? of Manchester? What are the chief attractions of Monte Carlo? 192–193

Give a description of the Kremlin in Moscow. Mention a famous opera house of Naples; important facts regarding Nuremberg, Oberammergau, and Olympia 193–194

What is the chief interest in Ostend? in Oxford? Explain the plan followed in the construction of the boulevards of Paris. What is the Latin quarter? the Louvre? the Quai d'Orsay? the Sorbonne? the Bon Marché? the Bourse? 194–195

What is Pisa's most celebrated building? Mention famous persons connected with Portsmouth; Prague; Ravenna 195

Justify Rome's designation as "the eternal city." Name the seven hills of Rome; three important thoroughfares; a fashionable promenade of the city. Describe the Vatican briefly 195–196

Discuss the industrial importance of the Ruhr district to Germany. Name its chief cities. . 196

State interesting facts about the Cathedral of Seville and the Cathedral of Saint Mark in Venice. What is the most famous prehistoric monument in Great Britain? 197

Name the most notable driveway and the largest park of Vienna. For what is Verdun noted? Versailles? Windsor? 198

ASIA

Compare the area of Asia with that of North and South America. Name the three great peninsulas on the south of Asia. What is meant by the term Oceania? 199

Name and locate the world's highest plateau; highest mountain; deepest lake; vastest plain 199

Describe briefly the course of the following rivers: Lena, Hwang, Brahmaputra, Indus. 200

Specify the coldest part of Asia; the hottest part; the area of the greatest rainfall; the desert portion. 200

Name 25 cultivated plants and 8 domesticated animals that are believed to have originated in Asia. Indicate the chief minerals known to exist in Asia 200

Name the independent countries of Asia . . . 201

Name five minerals found in Burma; three industries followed there 201

Who constructed the Angkor temples of Cambodia? 201

Describe the mineral wealth of China; Chinese agriculture; transportation; religion; government 201–202

Cyprus is named for its chief export. Explain what is meant by this 202

Name two semi-independent kingdoms on India's northern border. In the possession of what domestic animal does India lead the world? . 203

What was the first republic to adhere to the British Commonwealth of Nations? 203

Name the capital of Indonesia 203

Specify five products of Iran 204

Tell three kinds of farm communities in Israel. 204

Compare North Korea and South Korea in respect to manufacturing; materials . . 204

Indicate the two highest mountains of the Japanese empire; the highest active volcano; the chief market for Japanese silk 204

What is the established religion of Pakistan? . 205

Name the two largest islands of the Philippines; five distinctive trees; five distinctive birds; the principal crops; three leading manufactures 205

Characterize the agricultural resources of Russia's Great Northern Lowland; the agricultural industry of Turkey 206–207

Indicate the nature of the religious interest centering in Amernath; in Bethlehem. Mention a striking historical fact regarding Agra; Ankara; Baghdad; Calcutta 207

What is the chief commercial interest of Canton? Kobe? Madras? To what religion is each of the following places sacred: Lhasa, Mecca, Jerusalem, Medina? . 208–209

AFRICA

What is the distinguishing characteristic of Africa's coast line? How does this continent compare in size with North America? What is the Great Rift Valley? Name three lakes in this valley. Locate Africa's highest mountain 211

Name four great rivers of Africa; the greatest cataract in the world. Mention a remarkable fact concerning Lake Chad 211

Indicate the two desert areas of Africa and the region of the greatest rainfall. Describe the surface of the Sahara desert. Name five native cultivated plants of Africa; five distinctive species of mammals; a deadly insect; two important mineral products 212

Contrast the Bantus and the true Negroes in Africa. What religion of outside origin has the greatest following in the continent? . . 212

What is Egypt's principal crop? What part of the country is most productive? What is the chief cause of its productivity? 213

Name the world's largest source of tea in Africa 214

What country is the world's leading producer of cork? 215

Of what country is Dakar the capital? 215

For what purpose was Freetown in Sierra Leone founded? 216

Specify the leading industry and a distinctive industry of South Africa; three products of which the country provides a large part of the world's supply 216

Who founded Alexandria? Name a famous building which distinguished the city in ancient times. What is the largest city of Africa? Indicate two notable edifices of Cairo. 217

What are the chief attractions of Giza? of Karnak? of Luxor? 218

Of what importance is Casablanca? Dakar? Dar es Salaam? Johannesburg? Nairobi? . . 218

AUSTRALIA

Compare the area of Australia with that of the United States; that of Europe. What is the highest mountain in Australia? What regions are arid? 219

Account for the fewness of Australian rivers. Name the largest river system; three lakes of inland drainage systems. What two minerals are obtained in the greatest value? Name six other minerals produced in the continent 219–220

Mention two distinctive families of plants found in Australia. Note an adaptation by many Australian plants to their arid environment. What is Australia's national flower? Give the names of four valuable fodder plants of Australia 220

Indicate four soft woods and six hard woods obtained from Australian forests; two characteristic mammals and five remarkable birds found in the continent 220

What is the main industry of Australia? an export in which Australia leads the world? What is the meaning of the name Australia? What was the continent called before 1817?. 221

Locate New South Wales; describe its surface, rainfall, forests, and chief industry. What is its capital? Describe Queensland 221

Mention a noteworthy fact about the lakes of South Australia. What is the chief industry? 222

Where are the "Australian Alps?" Which state of the Australian Commonwealth has the largest area? The greatest population? . . . 222

What parts of Western Australia have sufficient moisture for agricultural purposes? What are the principal crops? The chief mineral product? 222

Name five manufactures of Adelaide; a prominent summer resort near the city; the chief industrial interest of Ballarat 222

What is the mean annual temperature of Brisbane? State facts of the city's early history. Name a notable square of Hobart 222

What is the population of Melbourne? Name four colleges affiliated with the University of Melbourne 222

Point out an important advantage of location enjoyed by Sydney. Name three outstanding manufactures 223

NEW ZEALAND AND ANTARCTICA

Describe an interesting volcanic region in North island. What is the chief mountain range of South island? the largest lake? the highest peak? 223

Name the most characteristic plant of New Zealand; an outstanding contribution to the world's economic plants; a distinctive wingless bird; the chief industry. Mention a noticeable feature of the country's industrial life; of the transportation system 224

What are the aborigines of New Zealand called? Specify the chief exports of Auckland; of Dunedin. Who founded Christchurch? . 224–225

Compare the area of Antarctica with that of Australia. Why have south polar expeditions landed on the side of Antarctica nearest New Zealand? Describe the climate of the continent. Name six recent expeditions which set out to explore Antarctica 226

PLACE NAMES

In what century did scholars begin the scientific investigation of place-names? 233

What is the study of place-names called and of what science is it a branch? 233

What useful purpose does this study serve? . 233

How is the scientific method applied, and what are the three main types of place-names? . 233

What natural surroundings led to the naming of the following: Andes, Biwa, Cameroon, Carlow? 233–234

From what languages do these places derive: Alcatraz, Amalfi, Anatolia, Angostura, Aorangi, Aral Sea, Arctic, Beirut, Bethlehem, Bihar, Cadiz, Carrara, Chimborazo, Cimarron, Corvallis, Dachau? 233–235

What tribes or peoples are commemorated in the following names: Britain, Dalmatia, Denmark, Estonia, France, Hungary, Iran, Italy, Kirghiz, Limoges? 234–238

What events suggested the following names: Dar es Salaam, El Paso, Kuwait, Labrador, Liberia, Monrovia, Nice? 236–239

Explain the origin of each of the following names: Managua, Mauna Loa, Menlo Park, Moluccas, Mongolia 239

What English words derive from the following places: Al Mausil, Derby, Gaza, Jodhpur, Lille, Milan, Nimes, Phoenicia? 233–240

What have the following names in common: Omaha, Orinoco, Ottawa, Passamaquoddy, Pensacola? 240

After what individuals are these places named: Monterey, Regina, Sedalia, Vancouver, Zaragoza? 239–241

What do the following place-names mean: Staten Island, Tucson, Waikiki, Yosemite? . 241

State the reason for the application of each of the following place-names: Russia, Santos, Saskatoon, Shantung, Sudan, Syracuse, Ticonderoga, Tunis, Ukraine, Windsor, Winnipeg 241

BIBLIOGRAPHY

The following titles of books have been selected chiefly from lists of standard works recommended by librarians for the guidance of general readers.

GENERAL GEOGRAPHY

Chase, Ilka—Second Spring and Two Potatoes. *Doubleday '65* (around the world)
Davies, Clarice S.—Exploring the World . *Roy '66*
Hall, Ernie—Flotsam, Jetsam, and Lagan from the Seven Seas, the Five Great Lakes, and Our Inland Rivers . . . . . *Cornell Maritime '65*
James, Preston E.—A Geography of Man. 2nd ed. *Blaisdell '66*
Jones, Emrys—Human Geography; an Introduction to Man and His World . . . . . *Praeger '66*
Perpillou, Aime V.—Human Geography . *Wiley '66*
Rand McNally New Cosmopolitan World Atlas. *Rand Mc Nally '65*
Scott, Jack D.—Passport to Adventure *Random '66*

REGIONAL GEOGRAPHY AND TRAVEL

United States

Brooks, Maurice G.—The Appalachians. *Houghton '65*
Carpenter, John A.—Alaska, From Its Glorious Past to the Present . . . Chicago, *Children's Pr. '65*
Davenport, William W.—Hawaii, 1966 *Mc Kay '66*
Ford, Norman D.—What to See in All America. *Crown '64*
Hollon, William E.—The Great American Desert, Then and Now. . . . . *Oxford '66*
Mandell, Muriel—The 51 Capitals of the U.S.A. (grades 5–8) . . . . . *Sterling '65*
Paterson, John H.—North America, 3rd ed. *Oxford '66*
Perry, George S.—Cities of America . . *McGraw*
Platt, Rutherford Hayes—The Great American Forest . . . . . *Prentice '65*
Road Atlas and Travel Guide . *Rand Mc Nally '66*
Steinbeck, John—Travels with Charley; in Search of America . . . . . *Viking '62; Banton '63*

Canada

Canadian Almanac and Directory for 1966 (119th yr.). . . . . *Pittman '66*
McDougall, Robert L., ed.—Canada's Past and Present . . . . . *U. of Toronto Pr. '65*
Myers, B. R.—North of the Border . *Vantage '64*
Nicholson, N. L.—Canada in the American Community . . . . . *Van Nostrand '63*
Scarfe, N. V. & others—A New Geography of Canada . . . . . *Gage '63*
Wilson, George W.—Canada; an Appraisal of Its Needs and Resources . . . *Twentieth Century '65*

Mexico, Central America, West Indies

Fodor's Guide to the Caribbean, Bahamas, and Bermuda, 1966. . . . . *Mc Kay '65*
MacPherson, John—Caribbean Lands; a Geography of the West Indies . . . . . *Longmans '65*
Nicholson, Irene—The X in Mexico; Growth Within Tradition . . . . . *Doubleday '66*
Rodman, Seldon—The Road to Panama. *Hawthorne '66*
Woodman, Jim—Discovering Yucatan. *Doubleday '66*
The World and Its Peoples: the Caribbean Region and Central America . . . . . *Greystone '65*

South America

Clark, Sydney A.—All the Best in South America, East Coast . . . . . *Dodd '66*
Clark, Sydney A.—All the Best in South America, West Coast . . . . . *Dodd '66*
Clissold, Stephen—Latin America; a Cultural Outline . . . . . *Harper '66*
Fodor's Guide to South America, 1966. *Mc Kay* '66
Johnson, William W.—The Andean Republics: Bolivia, Chile, Ecuador, Peru . . . *Time, Inc. '65*
MacEoin, Gary—Colombia and Venezuela and the Guianas . . . . . *Time, Inc. '65*
Schneider, Ronald M.—An Atlas of Latin American Affairs . . . . . *Praeger* '65

Europe

Clark, Sydney A.—All the Best in France. *Dodd '66*
Fielding's Travel Guide to Europe, 1966. *Morrow '66*
Fodor, Eugene, ed.—Britain and Ireland. *Mc Kay '66*
Fodor's Guide to Europe, 1966; a Comprehensive Handbook of 34 countries . . . . . *Mc Kay '66*
Houston, James M.—A Social Geography of Europe. Rev. . . . . *Hillary House* '66
Latham, Peter—The German Federal Republic. *Blackie '65*
Latham, Peter—Italy . . . . . *Blackie '65*
Salisbury, Harrison E.—Russia . . *Macmillan '65*
Shakleton, Margaret Reid—Europe; a Regional Geography. 7th ed . . . . . *Praeger '65*
Waldo, Myra—Travel Guide to Europe, '66–'67. *Macmillan '66*
The World and Its Peoples: Austria, Hungary, Czechoslovakia, Poland . . . . *Hawthorne '65*

Asia

Gary, Dorothy H.—Splendors of Asia. . *Viking '65*
Gellhorn, Eleanor C.—McKay's Guide to the Far East and Hawaii . . . . . *Mc Kay* '65
Gellhorn, Eleanor C.—McKay's Guide to the Middle East . . . . . *Mc Kay* '65
Hammer, Ellen Joy—Vietnam, Yesterday and Today. . . . . *Holt '66*
Lamb, Beatrice (Pitney)—India; a World in Transition. Rev. ed. . . . . *Praeger* '65
Langer, Paul F.— Japan, Yesterday and Today. *Holt '66*
Lindqvist, Sven—China in Crisis . . *Crowell '65*
McCune, Shannon B.—Korea, Land of Broken Calm . . . . . *Van Nostrand '66*
Tayyeb, Ali—Pakistan; a Political Geography. *Oxford '66*
Tregear, Thomas R.—A Geography of China. *Aldine '66*
Walz, Jay—The Middle East . . . *Atheneum '65*

Africa

Ady, Peter H.—Africa . . . . *Clarendon Pr. '65*
Nelson, Nina—Your Guide to Egypt. *Intl. Pubns. Serv. '66*
Sillery, Anthony—Africa; a Social Geography. *Humanities '65*
Steffen, Don Carl—The Splendor of Africa. *Walker '65*
Wattenberg, Ben and Smith, Ralph—The New Nations of Africa . . . . . *Hart '63*

The Pacific

Berney, Maurice, ed.—Australia. *Rand Mc Nally '65*
Briggs, Donald S.—Orient-Hawaii Guide; Introducing Hawaii, Japan, Hong Kong, and the Philippines . . . . . *Crown '62*
Corpuz, Onofre D.—The Philippines. *Prentice '66*
Horne, Donald—The Lucky Country: Australia in the Sixties. 2nd ed. London, *Angus & Robertson '66*
Waldo, Myra—Travel Guide to the Orient and the Pacific . . . . . *Macmillan '65*

Polar Regions

Debenham, Frank—In the Antarctic; Stories of Scott's Last Expedition . . . . . *Verry '65*
Dukert, Joseph M.—This is Antarctica. *Coward '65*
Eklund, Carl R. and Beckman, Joan—Antarctica. *Holt '63*
Silverberg, Robert, ed.—Antarctic Conquest; the Great Explorers in Their Own Words . *Bobbs '65*
Simmons, George—Target: Arctic; Men in the Skies at the Top of the World . . . *Chilton* '65

Space Exploration

Alexander, Thomas W.—Project Apollo: Man to the Moon . . . . . *Harper '64*
Emme, Eugene M.—A History of Space Flight. *Holt '66*
Faget, Maxime A.—Manned Space Flight. *Holt '65*
Hilton, William F.—Manned Satellites, Their Achievements and Potentialities . . *Harper '66*

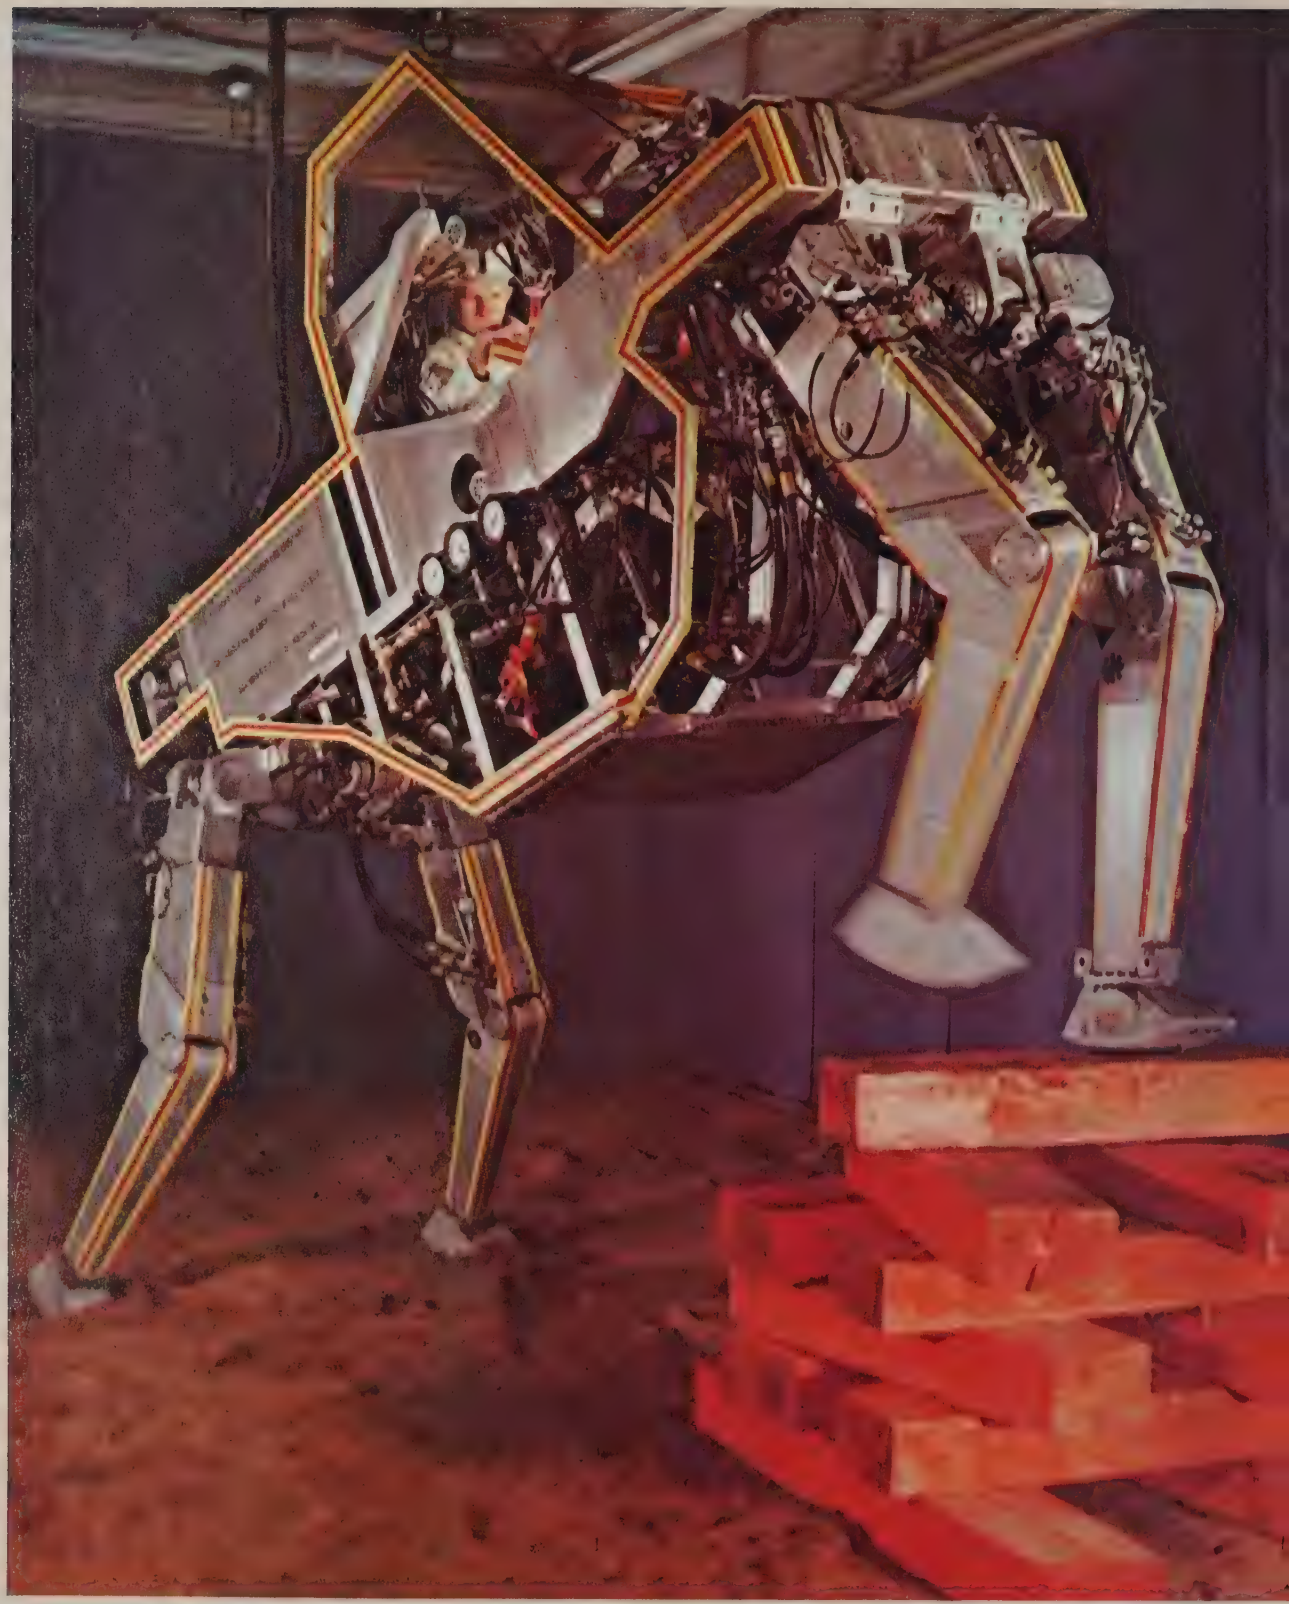
Picture Guide: Farm Machinery in the Field—Modern Farm Machinery—Modern Mechanical Research Machine.

Machines in the Field. Top: **Tractor-Pulled Harrow**—Used to break up clods of earth and destroy weeds in preparing land for seeding. Lower left: **Cultivator**—In operation to loosen and aerate the earth during the early stage of growth of field crops. Lower right: **Field Baler**—The sweep moving through the fields of cut straw feeds the crop into a pressure chamber to make firm, square bales for easy handling and storage. (*Courtesy Sperry Rand and Caterpillar Tractor Company*)

Modern Farm Machinery. Top. **Combine:** A self-propelling machine for harvesting that cuts, threshes, and cleans the grain while moving through the fields. Bottom. **Automatic Baler:** Pickup balers such as this lift the hay to a conveyor that carries it to a baling chamber, where it is compressed into bales weighing as much as 125 pounds and automatically bound with heavy twine or wire. Balers handle such crops as alfalfa, maize straw, or prairie hay. (*Sperry Rand/New Holland*)



Modern Mechanical Research. This prototype of a 4-legged quadruped machine was developed by General Electric engineers. It was designed to spur development of equipment to improve the mobility and materials-handling capabilities of workers under the most severe conditions. By an advanced control system, the machine mimics and amplifies the linear movements of the operator. The front legs of the unit are controlled by the operator's arms and the rear legs by his legs. The research prototype—11 feet high and 3000 pounds in weight—was built by GE under a joint U.S. government agency contract.

Economics and Useful Arts

INTRODUCTION

ECONOMICS is the study of the means by which people obtain their livelihood and satisfy their wants. Many thinkers maintain that the economic system under which a people lives largely determines the form of all its institutions, including its morality, family life, religion, and art. Whether or not this view is entirely correct, there can be no doubt that, along with political government, economic conditions constitute a factor of supreme importance in the life of man.

The economic system touches the life of every man, woman, and child, primarily through their jobs or other sources of income or support and through the prices which must be paid in securing what they want. When jobs fail or prices fluctuate unduly, the average person senses that something is wrong. On giving it proper attention, he begins to perceive that he is part of a vast system of world-wide sweep. If he is to be an intelligent citizen and understand the forces which have such a large part in determining his well-being, it is essential that he study the economic system under which he lives.

The Economic System. In the normal course of events, every one of us, unless he is altogether dependent on others, contributes something to the common store of goods and services. In return, he receives, through the agency of money, the right to a certain share of that common store.

The present economic system of production, distribution, and consumption has been built and rebuilt by many generations, the results differing according to each generation's degree of intelligence, skill, and invention, its command over nature, and its social relationships. The system rests on such institutions as property and contract, the division of labor, competition, and combination. Behind all the factors of an economic system are the laws of human nature. These laws, working through the instincts to acquire, to possess, and to provide for family and dependents, operate to convert the vast resources and powers of the earth into human service.

Under the impact of two world wars, the economic system has been subjected to tremendous strains and shocks of abnormal periods. We have seen inflation and deflation at their greatest extremes, high prices, scarcity of raw materials, rationing and governmental price fixing, excess profits tax, and other programs and policies necessitated by world conflict. The divergent interests of workers and employers, labor and capital, have frequently set class against class, while the intensive research in products and methods has given us great improvements in machines and time-saving devices, all of which have displaced great numbers of workers from one form of employment into other forms, causing a change in the personal life of the individual affecting his housing, type of employment, wage, and social position.

The economic system of a democratic country must assume that the right of private property is an inalienable right. With this right of ownership and possession for use, man becomes a dignified human being and possesses initiative and an incentive to achieve a better education, and a better position so that he may provide more adequately for himself and his family

Today, millions of people live under one or the other of two world economic systems designated as Capitalism and Communism. In the "free world," where people are self-governed, Capitalism prevails. The economic life of the country is carried on by private enterprise instead of government directives. The individual citizen can choose his own occupation, invest his savings as he wishes, and otherwise manage his personal and business affairs. Competition is essentially free, and the hope of profit provides an incentive for industry and thrift. In Russia, which operates under a system of modified Marxist Communism, production has been placed on a basis of use rather than profit, and the strong central government allocates production, regulates prices, and assigns positions. Under this "controlled economy" the individual surrenders his independence and initiative and has his entire future education, work, and leisure time planned for him. While Russia has recently made some concessions to the individual citizen by increasing the supply and availability of consumer goods, an extreme form of Communism exists in mainland China.

In the United States of America, which has the world's highest standard of living, it is recognized that the government, as a servant of all the people, must provide for laws and regulations so that all persons, regardless of race, creed, or color, may have the opportunity of training and work so that they in return may provide for themselves and their families. The purpose of a government in our economic system is simply to outline the rights and responsibilities of each group, so that no one transgresses upon the rights of others.

The Division of Labor. This is the key to the understanding of the whole economic order. If every man or every family produced only for himself or itself, there would be no exchange, no markets, no money, no means of transportation; in fact, no economic system. Some such situation actually existed in the more primitive ages of the world where each household was almost self-sufficient. With the advance of civilization, however, came the division of labor. Men have discovered that it is far more profitable to co-operate with one another, each finding and keeping to his own special task.

Ours is an age of specialization. To provide the breakfast of even the humblest family in a modern country, all parts of the earth are drawn upon. To serve our needs we have thus built up the vast network of modern trade and commerce.

Linking the World. The greatest benefits of the division of labor are reaped when cities and districts and countries exchange with one another those products which they can produce most advantageously. Such advantages in the production of certain commodities may arise in a particular place by reason of its climate, soil, natural resources, and the capacities of its inhabitants. The United States, with its wide range of soil and climate, is more self-sufficient than most countries. But it needs the rubber and tin of the East Indies, the silk of Japan, the nickel of Canada, and a thousand other products which commerce brings to our shores.

In a similar way, different parts of the same country specialize and create domestic trade. Indiana specializes in corn; South Dakota, in wheat; California, in oranges. Each produces the crops which it can raise to the greater advantage. Likewise, the city depends on the country, but so also does the country depend on the city.

By aid of the means of communication, we have today markets that are nation-wide and even world-wide for the main articles of commerce—wheat, cotton, wool, rubber, and so forth. By aid of the system of transportation, the resources of the world are exploited and brought wherever there is a demand for them. Nowhere have these agencies been more highly developed than in the United States, and nowhere have they been such important factors in the building up of a national life.

Capital and Labor. We often speak of capital as a form of wealth. It also has another aspect, which appears when we contrast capital with labor. The relationships among these two contributors to economic production constitute one of the most interesting and dynamic aspects of society. Before the Industrial Revolution, workers generally owned the tools of their craft. The mechanization of industry, however, separated workers from the tools of production, which became too costly and impersonal to be owned by each man. Ownership passed to the company or corporation employing the workers. Consequently, interest in the products of the economic unit became divided, with portions going to both owners and workers. During the 20th century, ownership claims became further separated from management, as a third specialized contributor to economic activity. The expectations of all three have now to be balanced and reconciled.

The diverse interests of all contributors and claimants against the economic product or output are in conflict among themselves, but coordination of them is essential in the harmonious functioning of the economic system. They *must* work together. The dominance of any one of the interests shifts the balance of power. Owners originally held dominion —with the rise of labor unions, however, control over economic processes passed more to workers collectively. More recently, managers have enjoyed a type of supremacy. Inability to resolve conflicts among these parties has led to the government's increasingly mediating and regulating their respective activities. These issues are treated in the *Labor Relations* section.

From Producer to Consumer. When production takes place on a large scale, the consumer is no longer in direct and personal relation to the producer. Hence arises the need for agencies to bring the two together. Modern business makes necessary a system of commission houses, jobbers, wholesalers, and retailers. They all have their parts to perform in the division of labor, and, as such, they serve useful economic functions. The practical aspect of this subject is taken up in the discussion of *Marketing*, and *Selling and Advertising*.

Money as the Medium of Exchange. All this interchange requires a scale of value and an exchange system. This is achieved through the modern use of money. Direct barter, various commodities, and silver and gold have served as means of exchange, but today money serves this function and, depending upon a convention or custom, it includes anything *generally* acceptable as a means of making payments. Thus, in the U.S. today, money includes coins, paper bills, and demand (or checking) accounts.

For the creation and control of money, a vast system of institutions has arisen, consisting in the U.S. of individual banks and other financial institutions, as well as the Federal Reserve System—and, on the international level, there are such institutions (with the U.S. and other nations as members) as the International Monetary Fund and the International Bank for Reconstruction and Development, generally known as the World Bank.

Pervading the monetary system is the very important element of credit. In effect, credit is a special form of money which expands and contracts as loans are made and then repaid. It permits purchase in advance of immediate ability to pay, thereby generating a chain of economic activity from borrower, to retailer, to manufacturer or builder, and thence to employees and purchasers.

The control of credit is the key to the expansion of the means of production, the level of employment, and the scale of living. Governments ultimately hold this key. In the modern world they recognize this responsibility and devote much of their attention to it in order to keep as even a keel as possible between inflation with rising prices and deflation with attendant unemployment and loss of purchasing power. These subjects are treated under *Insurance*, *Investments*, *Money and Banking*.

The Stages of Production. In a study of Useful Arts, we begin with the land, for on it or out of it (including, as economists do, the oceans and inland waters as part of the "land") are produced all the raw materials which the labor and organization of men turn into the means of satisfying their numerous wants. Thus we have first in order the extractive industries, which are described under the titles *Agriculture*, *Animal Industry*, *Fisheries*, and *Mining and Mineral Production*.

Most raw materials—wheat, cotton, wool, silk, iron, copper, lumber, and a host of others—go through many and elaborate processes before they are ready for their final use. They must be conveyed by land and water, they must pass through many hands, they must be treated by complicated machinery. Production calls for the work of the inventor and of the engineer no less than that of the farmer and of the miner. Hence the division on *Inventions* and on *Engineering and Building*.

Then comes the last stage, that of manufacturing. In the plant of the manufacturer, the work of the farmer, the miner, the inventor, and the engineer is brought together. Out of the factory the results of their labor pass at last as finished goods, and the whole roundabout process of production is complete. The more important aspects of this last step are treated under *Manufacturing*.

The Age of Industry. One man today can do the work which hundreds or even thousands were needed to perform in the pre-industrial age. Power has been harnessed and applied in countless ways. Steam and electricity and oil and gasoline serve the desires of man. The blast furnace, the power loom, the self-binding reaper, the linotype machine—to mention at random a few of our innumerable inventions—make possible an efficiency of production which surpasses the wildest dreams of the past. The standard of living of ever-greater populations has risen vastly. The ordinary man has at his command commodities that in earlier times were the rare luxuries of kings. Thus has industry, aided by invention, revolutionized the world. The Industrial Revolution is well named because, of all the great changes society has known, none has been at once so rapid and so extensive as this development. A period of much less than a hundred years saw the transformation of the everyday life of our Western civilization, saw a remarkable change in the habits and thoughts and modes of work of many millions, saw a new power over nature created, and saw the very face of the country completely altered.

To understand these things is to understand our own age and civilization. Through a study of economics and the arts of production, we may attain this understanding and learn in a new way the meaning of the world and the society in which we live.

Mass Production. A logical modern extension of the Industrial Revolution has been the introduction of large-scale manufacturing operations. These cut unit costs, thus permitting lower prices, wider markets, and greater profits. The next step is investment of part of the profits and new money in developing new products through research and utilization of the advances of science.

As a final stage comes the application of the computer for making automatic numerous steps in manufacture, control of operations, and even many decisions of management.

COMMERCE

COMMERCE consists of all those processes of trade involved in the general distribution of commodities from the producer to the consumer. However, the term generally implies an exchange of large volumes of merchandise between different places or communities rather than the trade carried on between individuals. Traffic passing from one nation to another is *foreign*, or *international*, commerce; that moving between localities included within national boundaries is *internal*, or *domestic*, commerce. In the United States, commercial shipments of merchandise from one state to another are said to enter nto *interstate* commerce.

Origins. The desire of man to satisfy his wants as easily as possible supplies the primary reason for commercial transactions. However, there can be comparatively little exchange between countries or districts inhabited by people who produce the same type of commodities; for then, neither locality has anything required by the other. Commerce, therefore, depends upon existing differences in temperature and climate, in natural resources, in industrial development, or in racial and cultural characteristics.

Transportation and Commerce. Wherever such differences exist, the inhabitants of one district will generally have a surplus of certain commodities which they are anxious to exchange for the surplus from other places. But, before the exchange can be accomplished, the goods must be transported to the locality where they are needed. For this reason commerce and transportation are mutually dependent to such an extent that the condition of one is almost invariably indicated by a corresponding degree of development in the other.

Because of this intimate relationship, the history of commerce may be divided into three fairly distinct periods: First, that in which transportation was accomplished by man or by beasts of burden on land, and by coasting vessels on the water. Second, that in which mariners, by the aid of the compass, were able to guide their sailing vessels upon the open seas. Third, that in which transportation depended chiefly on the power of steam, internal combustion, and other forms of engines. The first period, of possibly 5000 years' duration, extended from the beginning of commerce well into the 15th century, in spite of the fact that the compass was known in parts of Europe as early as 1200; the second period, of about 400 years' duration, may be said to have terminated in 1838, when the first line of commercial steamships began. The third period is that of the past century.

ANCIENT COMMERCE

Early exchange centered on Mesopotamia, the "Great Road" between Central Asia, the Mediterranean Sea, and Egypt. Commerce was related to geographic location and raw material shortages. Metals, semiprecious stones, building stone, timber, and aromatic woods and spices were important commodities. Manufacturing of woolen cloth and bronze work occurred. Until 3000 B.C., trade was by barter and controlled by the temple. Early legal codes, and even the beginning of civil law, evolved from the commercial experience and early guilds were formed. In this period, Damascus in Syria emerged as a major trade center for the caravan routes crossing the region from the Mediterranean and Red Seas to the interior.

The Phœnicians. The first people devoted chiefly to commerce were the Phœnicians, who inhabited a strip of land about 100 miles long and 10 miles wide on the eastern coast of the Mediterranean. Forced upon the sea as fishermen, these people gradually developed commercial fleets which in time extended their voyages to the Strait of Gibraltar and even north to England. The ships brought back ivory, tin, copper, and precious metals, while caravans sent inland brought spices and frankincense from India. Manufacturing produced glassware, linen and woolen cloth, and metal work. Profits from commerce and manufacturing supported the merchant and leisure class. Great cities such as Sidon and Tyre emerged and extensive colonization, such as the founding of the great city of Carthage, took place on Mediterranean shores and parts of the Atlantic coast. For perhaps 1000 years, the Phoenicians dominated commerce and served not only to exchange commodities but ideas and cultures, as well.

The Greeks. Eventually, the commercial supremacy of the Phœnicians passed to the Greeks, who excelled both as sailors and as business men. Their homeland, which in area was smaller than the state of Maine, nevertheless offered great incentives to commerce. It was sufficiently fertile to afford a surplus of some products, such as wine, figs, and olive oil, but it did not produce enough grain to feed the population. Mountains on the north protected it fairly well from attack by land; it was centrally located in relation to other countries of the Mediterranean; and its extensive coast line afforded many good harbors.

The conditions of living in a small, well populated country having an insufficient supply of grain were conducive to emigration; ships furnished an easy means of travel. Consequently, for a period of about 500 years, the Greeks followed a consistent policy of founding and of developing settlements in fertile sections of foreign lands, notably on the Black Sea, in Asia Minor, and in southern Italy and Sicily. Malaga, in Spain, and what is now Marseille, in France, were sites of thriving Greek colonies. From these colonies, grain and raw materials were supplied to the mother country, which developed many manufacturing industries, especially the production of bronze, clay, marble, and woolen products.

The Greeks were quick to adopt new devices for facilitating commerce. From contact with the Phœnician traders, they acquired an alphabet, which they greatly improved. From the Lydians of Asia Minor, they learned to mark pieces of silver with an official seal and to use these coins as money.

In spite of the success of the Persians, who broke the Greek power in the East, the Western colonies developed more rapidly than before, while Greece itself, under the leadership of Athens, reached the pinnacle of its power.

Empire of Alexander. The enormous eastern empire held by the Macedonian, Alexander the Great, took away from Athens the control of commerce and led to the development of great commercial cities farther east. Of these, the largest was Alexandria, located near the western corner of the Nile delta. As the greatest of Hellenistic cities, it surpassed all previous commercial centers in volume of trade and was a cosmopolitan economic and intellectual center. The Pharos, the 370-foot-high harbor lighthouse, was considered one of the seven wonders of the ancient world.

The Romans. The expansion of Roman power outside of Italy is said to have begun in 241 B. C., when Sicily was taken from the Carthaginians. Ninety-five years later, the great commercial cities of Carthage and Corinth were destroyed by Roman soldiers, and Greece and Macedonia were reduced to the position of Roman provinces.

Although Rome ruled the Western world, she never became a commercial city. Captives of war were extensively sold as slaves, and great quantities of foodstuffs, manufactured products, and luxuries were sent to the capital by sea, and over the fine roads that were constructed by Roman engineers, even in the farthest provinces. These products, however, to a large extent, did not represent commercial transactions but were the tributes and taxes imposed upon conquered peoples. What Rome gave in return was almost five centuries of comparative peace and security, during which time commerce developed wherever conditions permitted.

MEDIEVAL COMMERCE

During the "dark ages" that followed the fall of Rome, commerce was almost entirely in the hands of the Mohammedans, with centers at Baghdad, Damascus, Cairo, Alexandria, and the Moorish cities in Spain.

Western and northern Europe became divided under the feudal system into thousands of tiny units, each attempting to be complete within itself, and entirely independent of all external sources of supply. Roads were totally neglected; strangers were regarded with suspicion; robbery was a common practice; and commerce, under such conditions, was quite naturally almost nonexistent.

Growth of Towns. Soon after 1000 A. D. the need for places where an interchange of commodities might be carried on was filled by the widespread development of towns. In these growing communities, manufacturing and trading not only became possible, but were necessary in order to provide something to exchange for the food and raw materials brought in at first from the surrounding country, and, later, from other parts of the world.

Under these conditions some men were enabled to devote all of their time to trading and dealing in commodities. The fear of the townspeople that these traders would take undue advantage of their opportunities, coupled with the prevalent suspicions of all strangers, next led to the establishment of *public markets*, where commercial transactions might be carried on under official supervision. As the markets increased in size and prosperity, traders customarily united for mutual benefit, forming *merchants' guilds*. Somewhat later, the craftsmen also combined, according to their special trades, to form *craftsmen's guilds*. The guilds provided the merchants and artisans with a position in the social order, a monopoly of the town's trade, and considerable power in local government.

Fairs. European trade expanded in the 11th century to meet the demand for goods from beyond local regions. This led to the establishment of fairs, usually held annually and under the protection of powerful lords. Participants were guaranteed protection and safe conduct, and efforts were made to ensure honest dealings. The fairs of Champagne, in northern France—in a fertile region crossed by major trade routes—were the most famous. Each country and region, however, had its own fair. As the most important form of commercial activity in their time, medieval fairs had a profound influence: they served to promote Western civilization by destroying the provincialism and bigotry of the "Dark Ages," and by establishing the basis for expanded trade, monetary economies, and commercial law.

Risks of Medieval Commerce. The extensive commerce of the latter part of the medieval period was carried on at very great risk, because of constant rivalry and open warfare between great commercial cities. There was no central government sufficiently powerful to enforce its laws and to guarantee security. Shipments on land and by inland waterways were subject both to innumerable and excessive tolls and to constant danger from highway robbers. Similarly, coasting vessels always had to be ready for battle with pirates or with ships from rival cities.

Venice and the Hanse. In the north of Europe, during the 13th and the 14th century, the great commercial cities of Lubeck, Hamburg, Cologne, Danzig, and many others united, for mutual protection, into an organization known as the Hanse, or Hanseatic league. This league became extremely powerful and had complete control of commerce with the countries on the Baltic and, to a large extent, with those on the North Sea.

On the Mediterranean the struggle for supremacy was largely between Venice and her chief rivals, Genoa and Pisa. Leadership was secured to Venice by the crafty manner in which the doge, Enrico Dondolo, directed the energies of the Fourth Crusade, first to the capture of Zara, a rival Christian city, and next, in 1203, to the subjugation of Constantinople. Venice then completely dominated the trade with the East, and developed commerce to a degree never before attained. Venetian methods of banking and bookkeeping represented standards that were copied throughout the commercial world.

Between Venice and northern Europe, commerce was carried on in two ways: Traders from central and southern Germany were permitted to bring their metals, furs, coarse textiles, twine, and leather over the Alps by way of the Brenner or the Saint Gotthard pass, to Venice. By sea, the Venetian galleys, with their precious cargoes of spices, dyes, alum, fine textiles, weapons, and paper, traveled to Flanders. Bruges, which was succeeded in the 15th century by Antwerp, was the common center at which the wares of Venice were traded for the fish, furs, coarse textiles, wax, grain, and salt meat brought by the ships of the Hanseatic league, and for the wool, tallow, leather, tin, and lead of England. English exports at this time were almost entirely under the control of the "Merchants of the Staple," a society composed chiefly of foreigners.

MODERN COMMERCE

During the 14th and the 15th century, England, France, and Spain were becoming nations in which many loosely connected feudal divisions were gradually merged under comparatively strong central governments. Then, for the first time, the individual cities of Italy and the weak organization of the Hanse came into conflict with commercial rivals who had less experience but were more powerful and determined than themselves.

Portugal, under the direction of wise rulers, had already attained the leadership in navigation; not because the Portuguese were better sailors than the Venetians, the Genoese, or the mariners of the Hanseatic league, but because they received encouragement and assistance from their government.

New Trade Routes. In the East, the ancient land routes by which the commerce of India and of China had reached Venice were gradually cut off by the spread of Turkish power. As a result, each of the important European nations was actively searching for the "Eastern passage" by which their ships could reach the fabulously rich countries of the Orient.

In 1492, Columbus, a Genoese in command of Spanish vessels, sailed west until he reached the New World, which blocked the direct route to Asia. Cabot, an Italian master of an English ship, reached North America in 1497. Finally, by sailing around Africa, Vasco da Gama, a Portuguese, established trade by sea with India in 1498, and returned home the next year with goods that sold for sixty times the cost of the voyage. In 1522 the expedition which had set out from Spain three years before under command of Magellan completed the first voyage around the world.

The Portuguese obtained the rewards due the winner of the race to the East, for to them Pope Alexander VI assigned all of Africa and of Asia, with the exception of the Philippines. The Americas, except Brazil, were allotted to Spain.

The Struggle for Supremacy. The open seas now became the highway on which the ships of Portugal, Spain, France, and England speeded in order to obtain as much as possible from the newly found sources of wealth. Portuguese ships brought back great quantities of Eastern products which, because of the increased supply, eventually sold at prices low enough to change such important commodities as tea, coffee, and sugar from luxuries to necessities. Lisbon for a time succeeded Antwerp as the most important city of commerce.

Spain. During the century which followed the discovery of America, Spain became the richest and most important country on the earth. From her colonies she received enormous quantities of gold

Year	Population	Total Commerce $	Commerce per Capita $	Ships, Sail Tons	Ships, Steam Tons	Railways Miles

and silver, and also many valuable cargoes of hides, drugs, dyes, cocoa, vanilla, and sugar. Manufacturing industries at home were developed on a large scale for the production of silk and woolen textiles, wines, soap, salt, and many other commodities. In addition to manufactured articles, Spain exported figs, raisins, olives, olive oil, iron ore, and large amounts of mercury for use in obtaining gold and silver at the mines of Mexico and Peru.

All of these great advantages were nullified and finally destroyed by a prolonged period of bad government, marked especially by exorbitant taxes of every kind, and by a policy of exploitation rather than assistance in connection with the colonies. So serious were the results that the population declined rapidly, and some great commercial cities retained only one-fourth of their former inhabitants.

Portugal. The commercial greatness of Portugal was open to attack by her rivals, because it lacked the firm foundation of domestic production. The Portuguese were excellent traders, but their country was small and was not developed industrially. Manufactured articles for export were not made at home but had to be purchased from other European countries. Consequently, England and the Netherlands were eventually able to cut off Portugal's supply of export goods, and to fill the Eastern demand themselves. In addition to this fundamental lack of commercial stability, Portugal fell under the harmful rule of Spain during the 60 years between 1581 and 1640. By the time the Spanish yoke was cast off, England had broken Portuguese control in India, and the Netherlands had taken the islands of Ceylon, Sumatra, Java, and the valuable Moluccas, or Spice islands.

The Netherlands. Dutch traders were quick to take advantage of the opportunities offered by the decline of Spain and Portugal. Their ships traveled to India and to the Eastern islands, and were equally active in European trade. Most of the wool exported by Spain was carried to northern countries by Dutch vessels, which also entered the Baltic and returned with cargoes from Russia.

At home, large business companies grew up, the manufacture of silk and of leather was developed, the fishing industry increased until more than 2000 fishing boats were regularly employed, and business of all forms was greatly stimulated. The Netherlands became the financial center, and Amsterdam the most important commercial city, of Europe.

Unfortunately for the country, a strong central government was lacking, corruption became common among high officials, and taxes were greatly increased. The volume of commerce ceased to grow after 1730. In 1798 the Dutch East India Company, which had ruled all of the Eastern possessions and for 180 years had paid average annual dividends of over 18 per cent, came to an end. Its debts of more than 50 million dollars were assumed by the government.

France. Among the five European nations that achieved commercial power during the modern period of 1500 to 1800, France was one of the two which a historian in the 16th century would probably have selected as most likely to reach and to keep first place. Portugal and the Netherlands were obviously handicapped by their lack of area and domestic resources. But France and Spain were the largest and richest countries of western Europe, and both had extensive coast lines. In exploration, France surpassed both the English and the Dutch, while in area of foreign colonies, she was second only to Spain.

France did develop a prosperous trade with the Levant and with Italy and Spain, but this could not become of first importance because faulty political organization raised almost insuperable obstacles to the free flow of commerce.

The greatest checks to commerce within the country were due to the existence of feudal divisions which prevented national unity, to the continuance of the guilds long after these organizations had been displaced in more progressive nations, and to the establishment of an absolute monarchy wherein the correction of existing evils was impossible unless the ruler was unusually strong and wise. High customs duties were collected whenever goods entered the country and also when they crossed from one internal division to another. The quarrels and the strict regulations of the numerous guilds

largely prevented any improvements in methods of manufacture, and, finally, selfish monarchs entered upon a series of wars which gained nothing at home and lost most of the colonies abroad.

England. In spite of serious wars and intense commercial competition with larger countries, England, by 1750, had become the dominating factor in world commerce. Of the various reasons for her success, two may be considered as fundamental: First, she was a part of Europe and yet was separated from the continent by a wide channel which effectively prevented invasion by land; this condition made the possession of a powerful navy a primary necessity for national safety. Second, England acquired a coherent central government much sooner than did her rivals, and this government was far more flexible and democratic than theirs.

As a basis for exchange with other countries, England had from very early times the products of her sheep industry and of her mines. Manufacturing industries were gradually developed, which changed these raw materials into cloth and metal products. Ships were required to carry the excess production to other countries, and ships were needed also for protection and to supply trained sailors to the navy in time of war. The government, therefore, adopted the policy of encouraging shipping and commerce. Whenever possible, special privileges were secured by the state for English merchants, and success in battle usually meant the addition of foreign colonies in which an extension of trade could be expected.

English Trading Companies. During the 17th century, English commerce was to a large extent controlled by trading companies such as the East India Company, the Guinea Company, the Virginia Company, and the Hudson's Bay Company. A trader who was not a member of one of the companies could deal only with France, Spain, or Portugal. The strict control and regulations of the companies provoked so much antagonism that they finally lost their power and disbanded. The Hudson's Bay Company, however, still exists as an ordinary business corporation.

Having extensive colonies which supplied raw materials and required manufactured articles in return, together with a powerful merchant marine for the distribution of her products, England experienced at home a high degree of industrial development. Textiles and products of iron and steel were the chief commodities manufactured and exported. Homeward bound ships brought wool, cotton, naval stores, grain, sugar, tea, coffee, spices, tobacco, and rum; also silk, linen, and other foreign

textiles. It must not be thought that all of this commerce depended on the colonies, for, at the end of the 18th century, more than half of England's trade was carried on with Europe. The trade with America ranked second in value. That with Africa was very much smaller, but was considered important because it furnished a supply of slaves for sale in America and the West Indies.

Canadian Commerce. The early commerce of Canada was controlled largely by monopolistic companies chartered by France. After the English conquest, control passed to British traders who confined their commerce almost entirely to the homeland. Early trade with the United States was by smuggling until Great Britain removed restrictions on normal traffic.

In 1975, Canada's foreign trade amounted to over $66 billion, with about two-thirds of its exports going to the United States, compared to about 6% to Great Britain. The United States supplies Canada with about 60% of its imports, while Great Britain supplies about 4½%. Major exports to Great Britain include foodstuffs and tobacco (about 20% of the total in value), aluminum, copper, nickel, newsprint, and lumber. Exports to the United States include raw materials, petroleum, lumber, and wood pulp. Canadian imports are largely manufactured goods, such as auto parts, machinery, and vehicles. The accompanying tables indicate the character of Canadian trade.

In 1975, Canada ranked 11th in world trade. It has enjoyed the trade advantages associated with membership in the British Commonwealth. In 1974 Canada entered into a comprehensive trade agreement with the European Common Market. This was an attempt to reduce its commercial dependence on the United States.

UNITED STATES

The preceding sections relate the story of commercial progress on the earth, from the days of ancient Babylon to the beginning of the 19th century. At the conclusion of this 4800-year period of development, world commerce had reached a yearly value of about one and one-half billion dollars. Of the total, the United States of America was credited with about one-tenth.

World commerce, due to advanced methods of transportation and communication, increased tremendously from 1800 to the present time, while from 1800 to the beginning of World War I the rise of American foreign commerce was almost proportional to that of the rest of the world. Assembly line methods in production of ships and planes enabled America to lead the world in World War II in its merchant marine tonnage, rail transportation, and air transport.

In the following paragraphs, the development of foreign commerce in the United States is given especial attention. The corresponding growth in other nations is indicated by the commercial relations of these countries with America, and by the comparative importance of each in world trade.

The commerce of the English colonies in North America was such as would be expected between fertile, newly discovered lands, and the older, more advanced countries. Food and raw materials, consisting chiefly of flour, grain, tobacco, lumber, fish, potash, and indigo, were exported in exchange for textiles and other manufactured articles, and for colonial products such as sugar, molasses, coffee, and tea.

It is surprising to note that after the Revolution the United States continued to trade chiefly with England, although that country closed the ports of the West Indies to American ships. The European wars between England on one side, and France, Spain, and the Netherlands on the other, afforded the new nation its first great commercial opportunity. Having ships and sailors equal to any in the world, the American merchant marine developed rapidly, and carried a large share of the world's commerce while Europe was busily engaged in warfare.

This commercial growth received serious checks when France and England both placed arbitrary restrictions on neutral shipping. A general embargo, ordered by the American government in 1807 as a means of retaliation, proved even more disastrous. Commerce declined until the conclusion of the War of 1812, and then, after a few years of sharp fluctuations, experienced a long period of slow growth.

Expansion and Development. This period was, for the United States, one of active territorial expansion and economic development. The West grew rapidly, and in various parts of the country improved highways, new canals, or steamboats on the large rivers supplied better means of transportation. At the same time, more and better manufactured commodities were produced by industries which had originated or developed during the seven years between the passing of the Embargo act and the end of the War of 1812. Domestic manufacturers fought hard to retain the home market which had been created by the temporary shortage of foreign goods. They succeeded to a notable extent because their increased *production* was accompanied

by an even greater increase in *demand*, together with great improvements in the natural means of *distribution*. Although the *per capita* consumption of foreign goods decreased, the total amount of foreign trade continued to increase, and was carried chiefly by American ships. During this period the American merchant marine approached very closely in size that of Great Britain, and was second to none in skill and efficiency.

The change in the economic condition of the country is well shown by the changes in the list of exports. In 1800, grain amounted to one-third, and cotton to less than one-fourteenth, of all exported merchandise; in 1860, cotton accounted for four-sevenths of the total, and grain for only one-thirteenth. Manufactured goods, which stood low on the earlier list, were second only to cotton in 1860.

Triangular Exchange. The South gave all of its energies to the production of cotton. The North developed extensive manufacturing industries, but it also produced sufficient grain and meat to supply the entire nation and still had a surplus for export. From New Orleans, enormous quantities of cotton were shipped to Europe. Europe returned to New York textiles, articles manufactured from iron and steel, and luxuries. Finally, the cycle was completed and the South received compensation for its cotton in the form of food and manufactured products sent from the North.

Effects of Civil War. Intersectional warfare checked for a time the development of American commerce. With the war's end, slavery had been abolished and the nation was again a political unit. The war also had the effect of influencing the economic futures of the two opposing sections. The world demand for cotton, and the consequent high prices paid for this staple, forced the South to resume the production of white fiber as rapidly as possible. In the North, a shortage of labor accentuated the advantages that were to be obtained by the extensive use of machinery in the factories and on the farms.

1850 to 1900. During the second quarter of the 19th century the annual production of coal increased from one-half million to six million tons, and the economic value of railroads was clearly demonstrated. Between 1850 and 1860, thousands of miles of track were laid, especially in the Middle West. Our domestic exports, which amounted to 316 million dollars in 1860, averaged less than 225 million dollars a year until 1870; but by 1880 they became 824 million, and in 1892 they exceeded one billion dollars for the first time.

The last half of the 19th century was marked throughout the civilized world by the expansion of industrial and commercial activities. That the United States was able to hold a position of decided commercial importance is shown by the tables, *A Century of Growth of the United States* and *World's Progress in Commerce and Production*.

Merchant Marine. This position was retained in spite of a great decline in American shipping. Many conditions contributed to this marked decrease in tonnage. The country was expanding and developing so rapidly that there were unusual opportunities for profits in domestic rather than in foreign trade. Higher tariff rates gave protection to home industries but did not help the merchant marine. Lower priced, foreign-built ships were not purchased because, according to the law, they could not obtain American registry. And, finally, we were not prepared to build iron ships at a cost that could compete with those built in England.

In 1860, 70 per cent of our exports and 63 per cent of the imports were carried by American vessels. These ratios fell to about 10 per cent in 1910 but rose to more than 35.8 per cent by 1935. The foreign commerce of the United States amounted to $21.26 *per capita* in 1860. Fifty years later, although population was three times as great, the figures had increased to $34.78. In 1920, following World War I, the amount became $120.81, but fell to $77.59 by 1929. It was $48.92 in 1940; $137.63 in 1964.

U.S. Exports and Imports. Historically, U.S. exports were characterized by large quantities of relatively few products, largely agricultural in nature. In 1860, 80% of the exports were in this category, reflecting the impact of colonialism upon the country. In 1975 exports from the U.S. amounted to over $106 billion, consisting largely of manufactured products. Principal exports included various machinery (almost one-third of the total), grain, industrial chemicals, iron and steel mill products, automobiles and aircraft.

While major imports emphasize raw materials and food requirements, the U.S. also purchases manufactured goods abroad. While manufactured items accounted for more than half the imports in 1860, by 1975 they accounted for only slightly more than one-third. Major imports include machinery and vehicles, petroleum, electrical apparatus, iron and steel products, wood pulp and paper products, metals, chemicals, sugar and coffee. Many of these items come from the uuderdeveloped countries of the world.

U. S. Foreign Trade. The foreign trade of the United States amounted to $4.2 billion in 1913. Principal participants included Great Britain, an 18% share, Canada 13%, Germany 12.5%, France 7%, and several other nations significant largely in terms of a single commodity—Cuba and sugar, Brazil and coffee.

By 1975, not only had total U.S. foreign trade increased to nearly $200 billion, but the importance of the various countries had changed. Canada continues to develop as a major source of trade, with more than 20% of the total. Other large participants include Japan, with about 10%; West Germany, about 6%; the United Kingdom, about 5%; and Mexico, about 4%.

Internal Commerce of the U. S. Although the United States ranks high in world commerce, the internal or domestic trade is of far greater importance. Within American boundaries, sections of widely diversified economic and geographical character specialize in the production of commodities to which the locality is best adapted. Excess production may be transported to any part of the country, or may be shipped out without any hindrance of toll or tariff except the cost of transportation. The great size of this free market has been a vital factor in American economic development.

Europe's Common Market. The existence of this huge free market in the United States provided the basic argument for the economists and statesmen who created the European Common Market. Western Europe possessed a pool of skilled labor, capital, and population greater than that of the United States, but their potential was not realized because of trade and political barriers. The Treaty of Rome in 1957 provided for gradual reduction of tariffs and aimed at unified labor and social-welfare conditions and freedom to travel, trade, employ, and invest without border hindrances. Political integration was set as the ultimate goal.

Governments as Traders. Meanwhile world commerce contended with a refractory element—the Communist regimes which barred private trading and channeled all exchange of goods through their governments. The element of political policy was thus injected into the global market place. Lacking also was the element of stability since the Communist market might disappear overnight. Commerce between the free world and the Communist powers tended to be dictated by the needs of the latter and by their ability to pay in gold, since the goods they had available for export were severely restricted.

To a limited extent, the proliferation of new and underdeveloped nations had a like effect, since many of them had no individuals or business organizations capable of foreign trade. The rulers perforce set limits on what could or could not be bought or sold.

This situation forced on governments of the United States and other freely trading nations the task of handling a considerable part of the distribution of goods where such nations were involved.

Sources: Data for calculating information from Department of Commerce, Domestic and International Business Administration, and from *Statistical Yearbook (UN), 1976.*

Hence the rise of so-called foreign aid, under which credit or outright grants of money were extended to foreign governments to purchase goods. An example is the sale of American agricultural surpluses to India. Since such countries lacked exportable goods with which to make payment, the United States accepted payment in local currency and left it there on deposit.

Balance of International Payments. This term refers to the net result of a nation's transactions with the outside world in a given period. It is derived from statistics showing to what extent domestically produced goods and services have been exchanged with foreign countries, and how the differences in credits have been financed. The chief factors producing the balance are 1) exchanges of merchandise, services, and income on investments, 2) unilateral transactions like individual gifts and government grants, 3) transfers of long-term capital, and 4) movements of gold and short-term capital.

ECONOMIC DEPENDENCE OF THE UNITED STATES

The United States is more favorably situated in regard to raw materials than any other country. Nevertheless, her high scale of living and enormous consuming power create many needs that cannot be satisfied by materials obtainable within her own territories. The following table presents some of the commodities for which she is dependent chiefly on foreign sources of supply. Those in *italics* are of especial importance for national defense in the event of war. An asterisk (*) appears after those of which there is practically no supply native to the United States.

Material	Chief Uses	Quantity Imported 000 omitted	Chief Sources
Abaca	paper products	36 tons	Philippines
Aluminum	construction of airplanes, automobiles	457 tons	Japan, Canada
*Antimony**	printing glass	2,174 tons	Mexico, Bolivia
Arsenic	pesticides, medicines	13 tons	France, Sweden
Barley	food, livestock feed	2,000 bushels	Canada
Bismuth	glass, clothing, paint, medicines	1,331 lbs.	Japan, Peru, Bolivia
Black Pepper	food seasoning	51,049 lbs.	Indonesia, India, Malaysia
Cadmium	plating for mechanical equipment	5,928 lbs.	Canada, Australia
Chinawood Oil (Tung)	paints, varnishes, insulation	21,000 lbs.	Paraguay, Argentina
Chromite	hard steel, paint	1,350 tons	USSR, S. Africa, Philippines
*Cobalt**	steel alloys, colored enamels	5,200 tons	Belgium, Zaire
Cocoa	candy, beverages	233 tons	Ghana, Brazil
Coconut Oil	food, cooking materials	890 lbs.	Philippines
Coffee*	beverage	2,683 lbs.	Colombia, Brazil, Portugal
Hides and skins	shoes, leather, travel goods	69,000 lbs.	Canada, Brazil, India, New Zealand
Jute	twine, burlap, linoleum, carpet bags	250,000 lbs.	Pakistan, Thailand, India
Kapok	lifeboats, buoys, mattresses	9.8 tons	Thailand, Philippines
Lumber	construction	6,114,000 bd. ft.	Canada
Manganese	structural steel	766 tons	Brazil, West Germany, France, S. Africa
Mercury	electrical apparatus, medicinal agent	3,380 lbs.	Canada, Spain
*Nickel**	steel, electroplating	162,000 tons	Canada, Norway
Nutgalls*	dyeing, inks, color printing	N.A.	China
Nux Vomica*	medicinal agent	N.A.	Korea, Cambodia, India, Laos
Palm Oil	soap, tin plate	900,000 lbs.	Singapore
Petroleum, (crude)	fuel oils, gasoline, lubricants	1,498,181 bar.	Saudi Arabia, Nigeria, Canada
Petroleum, (refined)	gasoline; fuel oils, lubricants	666,858 bar.	Saudi Arabia, Iran, Canada
Platinum	electrical equipment, jewelry, chemical industries	1,900 oz.	Canada, United Kingdom
Rattan*	furniture	N.A.	Indonesia, Philippines, China, Malaysia
Rubber (crude)	footwear tires, electrical equipment	657 tons	Thailand, Ceylon, Indonesia, Liberia, Malaysia
Sisal Hemp	binder twine	N.A.	Mexico, Brazil, Haiti
Tea*	beverage	159,467 lbs.	India, Ceylon, China, Japan
Tin	canning, dyeing, textile manufacturing, solder	43,663 tons	Malaysia, Thailand
Wool (carpet)	rugs	119,600 lbs.[1]	Argentina, Pakistan, India, New Zealand, Australia, Syria, Lebanon, Iraq
Wool (unmanufactured)	clothing	33,600 lbs.	Argentina, Uraguay, Brazil, New Zealand, Australia

Data concerning imports are mostly 1975 figures taken from *Commodity Year Book, 1976*, or 1974 figures taken from *Statistical Abstracts, 1975*. [1] 1968.

COMMERCIAL RAW MATERIALS

By far the most important commercial raw materials are those commodities which are utilized for food, for clothing, for the production of machinery and of power, and for structural purposes. These are obtained from all parts of the earth as contributions from the three kingdoms of nature—the vegetable, the animal, and the mineral.

The following classification is based primarily on this natural division, and secondarily on the purpose for which each commodity is generally employed. In the various groupings are included the most important commercial raw materials, together with representative examples of a vast number which are of minor importance.

VEGETABLE PRODUCTS

Cereals: Wheat—including emmer and spelt—rice, corn, oats, rye, barley, the sorghums, millet, and buckwheat (not a true cereal but used as such).

Other Starchy Foods: Potatoes, yams, sweet potatoes, arrowroot, cassava (tapioca). See *Starch*.

Pulses: Peas, beans, lentils, soy beans.

Sugars: Cane sugar, beet sugar, maple sugar, palm sugar (jaggery), and glucose.

Vegetables: Artichoke, asparagus, beans (string), beet, cabbage, carrot, cauliflower, celery, cucumber, eggplant, endive, garlic, kohl-rabi, leek, lettuce, mushrooms, okra, onion, parsnip, peas (green), pumpkin, radish, rhubarb, spinach, rutabaga, squash, tomato, turnip, and various others.

Fruits: Orchard fruits—apple, apricot, cherry, peach, pear, plum, prune, and quince; various grapes—table, raisin, wine, and currant; berry fruits—blackberry, blueberry, cranberry, currant, gooseberry, huckleberry, loganberry, mulberry, raspberry, and strawberry; melon fruits—cassaba melon, muskmelon, watermelon; citrus fruits—citron, grapefruit, kumquat, lemon, lime, and orange; subtropical fruits—carob (Saint-John's-bread), date, fig, olive, persimmon, and pomegranate; tropical fruits—avocado, banana, guava, mango, papaw, soursop, and prickly pear.

Nuts: Almond (sweet and bitter)—Jordan almonds are a choice hard-shelled variety of sweet almond from Malaga, Spain; chestnut, native to the eastern United States, also imported from southern Europe; cashew nut, from India and Brazil—poisonous until roasted; coconut, commonly grown in tropical countries; filbert, grown in southern Europe; hickory nut, native to the eastern United States; litchi nut, a dried fruit from China; peanut, not a true nut but the fruit of a legume; pecan, both wild and cultivated in the southern United States; pine nuts, oily seeds of pines native to southern Europe and southwestern Asia; pinons, nuts from pines native to the southwestern United States and Mexico; pistachio, grown in Mediterranean countries; and the English walnut, extensively cultivated.

Beverages. The plant materials chiefly used for making beverages are coffee, the cleaned seeds of the coffee tree; cocoa, prepared from the seeds of cacao; maté, the dried leaves of a South American holly; and tea, the variously cured leaves of the Asiatic tea shrub. With these are sometimes grouped fermented beverages, such as beer, wine, sake (Japan), and pulque (Mexico), and also distilled liquors, such as whisky, brandy, rum, gin, mescaline (Mexico), arrack (Orient), and vodka (Russia), which, strictly speaking, are manufactured products.

Timber. Of imported woods, the most valuable include mahogany, teak, lignum-vitæ, Spanish cedar, Circassian walnut, rosewood, or Jacaranda (from Brazil), satinwood (from the East Indies and West Indies), ebony, greenhart (from South America), lancewood (from Jamaica), and rule boxwood (from West Indies and South America).

Fibers. Textile and cordage fibers include cotton, flax, hemp, jute, ramie, manila hemp, sisal hemp, bowstring hemp, sunn hemp, coir, pineapple fiber, and raffia. Among brush fibers are broom corn, piassaba (from the West Indies and from Brazil), saw palmetto (from Florida), and palmyra (from Ceylon). Other fibers or fiber-like products are kapok, or silk cotton; luffa, a vegetable sponge; Spanish moss, from the southern United States, used for upholstery; rattan, from the East Indies, used in making furniture, baskets, and whips. Fibers used for paper making are exceedingly numerous (See *Paper*.). Panama hat straw, or toquilla, is prepared from the young leaves of a South American screw pine.

Alkaloidal Stimulants and Narcotics. These include tobacco, the most extensively used narcotic, cola leaves, chewed by the Indians of South America; pituri leaves, used by the natives of Australia; the kola nut, containing caffeine, chewed by the natives of Africa; betel leaf and betel nut, widely used by Malayan peoples; hashish, from Indian hemp, used by the peoples of southern Asia; and opium, the dried juice of the poppy, used widely in the Orient.

Medicinal Plants. Many plants contain medicinal principles which experience has proved to be of such value that they are employed more or less widely by all civilized nations. Among plants used for their leaves are belladonna, one source of atropin; coca, the source of cocaine; digitalis, or purple foxglove, grown in Europe and in America; and senna, from Egypt and India. Some of the best-known medicinal roots are aconite, hydrastis (golden seal), gentian, ginseng, licorice, may apple, rhubarb, and sarsaparilla.

Among the most highly prized medicinal barks are cascara sagrada, native to California and Oregon, and cinchona, or Peruvian bark, the source of quinine, now obtained chiefly from cultivated trees in Java. Nux vomica (the source of strychnine), chaulmoogra, and the castor oil plant are valued for the medicinal properties of their seeds. Plants yielding medicinal juices include aloes and also the poppy, the source of opium. Among medicinal resins are asafetida, balsam of Peru, and guaiac.

Gums and Resins: Rubber, gutta-percha, balata, chicle, gum arabic, gum Senegal, gum tragacanth, turpentine, rosin, and copal.

Tanning Materials. These include various barks, woods, roots, fruits, and nuts which contain tannin. Among these are oak bark, hemlock bark, chestnut bark and wood, sumac leaves, canaigre root, myrobalans (unripe fruit), divi-divi (seed pods), quebracho wood, gambier (twigs and leaves), mangrove bark, and oak galls.

Dyestuffs: Logwood, fustic, Brazilwood, Lima wood, Osage orange, indigo, archil, and cudbear.

Vegetable Oils. *Drying oils*, used extensively in paints and varnish, include linseed oil, perilla oil, Chinese wood oil (tung oil), candlenut oil, hempseed oil, walnut oil, soy bean oil, poppy-seed oil, and sunflower oil. *Semidrying oils*, used for various purposes, include corn oil, cottonseed oil, sesame oil (benne oil), rape oil (colza oil), olive oil, apricot kernel oil, peach kernel oil, almond oil, castor oil, and peanut oil.

Vegetable Fats. These substances, which are solid at ordinary temperatures, include cocoa butter (See *Chocolate*.), coconut oil, palm oil, palm kernel oil, and Japan wax.

Essential Oils. Many of these form the basis of natural perfumes; as, for example, attar of roses, geranium oil, lemon-grass oil, lavender oil, neroli, ylang-ylang oil, and patchouli oil. Peppermint oil and spearmint oil are widely used for many purposes.

Spices and Condiments: Allspice (or pimento), cinnamon, cloves, mace, mustard, pepper, tonka bean, and vanilla.

ANIMAL PRODUCTS

Food. Beef, pork, mutton, poultry, and game form the chief items in the meat supply of most countries. In some parts of the world, meat from the whale, horse, camel, and reindeer is also used. Eggs, almost universally an important article of food, are a commercial source of albumin and are used also in tanning. Milk is the source of butter, cheese, casein, milk sugar, and various fermented beverages, such as koumiss and leben. Butter, cheese, condensed milk, preserved meats, canned meats, and meat extracts, though often classified as manufactured products, may also be listed here.

Fish, oysters, clams, lobsters, crabs, and shrimps, marketed fresh, dried, canned, or otherwise preserved, are used in great quantities for food. See *Fisheries*.

Animal Oils. Oils used for food include butter, lard, tallow, and oleo oil (See *Oleomargarine.*). Medicinal cod-liver oil is expressed from the livers of freshly caught cod. Large amounts of other fish oils are obtained, especially menhaden oil. (See *Fisheries.*) Sperm oil, valued as a lubricant, is obtained from the sperm whale. Wool wax, widely used in making salves and ointments, is the natural grease from sheep's wool.

Animal Fibers. Wool, produced chiefly by the sheep, is obtained also from the alpaca in Peru and from the Kashmir goat of central Asia. Silk, produced by the silkworm, ranks next in value to wool among animal fibers. Long hair from the tails of cows and from the manes and tails of horses is used in making bows for musical instruments, for weaving into haircloth, and for stuffing mattresses. Short hair from various animals is used as stuffing material and in making plaster. Swine bristles from Russia and China are largely used in making brushes. The hair of the Australian rabbit is one of the most important materials entering into the manufacture of felt hats.

Hides and Skins. See *Leather*.

Furs. The most expensive furs are probably those of the sea otter, the Russian sable, and the silver fox. Among other valuable furs are those of the seal, ermine, marten, weasel, mink, skunk, mole, chinchilla, beaver, muskrat, karakul sheep (yielding the Persian lambskin), various species of fox, wolf, and bear, and the larger cats, such as the lion, the tiger, and the leopard.

Horns, Hoofs, Bones, and Tusks. Ivory is obtained chiefly from the tusks of the elephant but also from the tusks of the hippopotamus, the horn of the narwhal, the tusks of the walrus, and the tusks of the extinct mammoth whose remains are still found in Siberia. Horns and hoofs are utilized for the production of buttons, combs, ornaments, and of cyanide compounds. Bones are used for making buttons and ornaments, for the production of fertilizer, and for the preparation of bone black and bone charcoal.

Bird Products. Besides eggs, the most important bird products include feathers, plumes, edible birds' nests, eider down, and guano (See *Fertilizer.*).

Insect Products. In addition to silk, the most valuable of all, insect products include honey, beeswax, lac, and cochineal.

MINERAL PRODUCTS

The immense number of commercial products obtained from the mineral kingdom may be classified as metals or nonmetals. The first group supplies the materials from which tools and machines are constructed. The second group is divided into mineral fuels (liquid, gaseous, solid) and other nonmetallic minerals, which includes building and chemical materials; abrasives; refractory materials; and precious and semiprecious stones.

COMMUNICATION

By communication is meant the transference of thoughts and of information from person to person. Underlying, as it does, all human cooperation, it has an importance which can scarcely be exaggerated. The initial step, and unquestionably the most important in making possible an unimpeded exchange of ideas, was the invention of spoken and, later, of written language.

A great length of time elapsed during which communication between distant points could be effected only by means of messages, oral or written, which were carried by messengers. The great development of electrical signaling devices and the vast improvements which have taken place during the past century in the means of transportation have reduced to comparative insignificance the time element in communication. With the help of the printing press, radio, television, and satellite, they can bring to all nations a knowledge of the events of importance in the whole world within a few hours of the time of their occurrence.

Early Postal Systems. The complicated postal organization of today had its origin in the system of private messengers employed by ancient rulers. Each messenger was given a fixed station where he should always hold himself in readiness to receive a message and to carry it to the next post. The emperor Diocletian was apparently the first to establish such a post open to the use of private persons. In the 12th century a commercial post was organized by the Hanse Towns of northern Germany, and in the 13th century a postal system was developed by the University of Paris for the benefit of its students. The national postal system in France was established by Louis XI in 1464.

Postal System in England. In England, private postal systems were used in the 14th century, but it was not until 1533 that Sir Brian Tuke was appointed the first "Master of the Post" by Henry VIII. Improvements in the service were gradually made, but, in 1812, the cost of sending a single sheet varied from 8 cents to 35 cents according to the distance. A money order system was begun in 1792 for the convenience of soldiers and sailors.

Due to reforms initiated by Sir Rowland Hill, a rate of one penny was established throughout the United Kingdom in 1840. The first adhesive postage stamp was issued in May of that year. This one-penny stamp was black and carried the profile of Queen Victoria. It had to be cut from the printed sheet. Perforated stamps were not officially issued until 1854. If the postage was not prepaid by means of a stamp, a double rate was charged upon delivery of the letter. The use of postage stamps made possible the mailbox, which was first introduced in 1855.

Universal Postal Union. In 1874 an International Postal Union was organized at Berne, Switzerland. This was followed in 1878 by a larger organization known as the Universal Postal Union. It became a specialized agency of the UN in 1947 and includes practically all countries of the world. All member nations are declared to be "a single postal territory for the reciprocal exchange of correspondence." The UPU regulates mailing procedures and aids governments in improving their mailing systems. UPU headquarters are in Berne, Switzerland.

Postal System in America. The general court of Massachusetts in 1639 ordered that the house of Richard Fairbank was to be the official distributing point for overseas mail. In 1691, Thomas Neale was by royal patent granted authority for the establishment and control of an American post, and, in 1693, Andrew Hamilton was appointed the first colonial postmaster general. In 1707, control of the post was purchased from Neale by the English

government, which held it until the Revolution.

Under the new order, Benjamin Franklin was appointed the first postmaster by the Continental Congress in 1775. The first Federal postage stamps were issued in 1847, although in 1845 the postmasters of various large cities were permitted to issue five- and ten-cent stamps at their own expense. Stamped envelopes were first used in 1853.

It was not, however, until 1856 that prepayment was required and stamps came into general use. In 1851 the rate was reduced to three cents up to a distance of 3000 miles, and in 1863 under Lincoln, this rate was established for all distances and free delivery was begun in some of the larger cities. A money order system was established in 1864; postal cards came into use in 1873; a two-cent rate went into effect for the first time in October 1883; a special delivery service, for which an extra charge was made, began in October 1885; and rural free delivery was inaugurated in 1896. In 1971 the Post Office Department was replaced by an independent U.S. Postal Service in the executive branch.

Parcel Post. By the provisions of the general parcel post act which took effect January 1, 1913, and by its subsequent revision, the transportation of parcels within certain limits of size and weighing up to 70 pounds is undertaken by the post office department. By facilitating the cheap transit of merchandise, this service has opened up throughout the entire country a market for goods sent by mail. For rate making purposes, the United States and certain other territories are divided into units of area which are the basis of eight postal zones. The zones represent an area having a mean radial distance of 50, 150, 300, 600, 1000, 1400, 1800, all beyond 1800, miles from the center of any given unit of area which is the mailing point.

The value of the parcel post service is enhanced by the privilege of insuring the contents of the parcel against loss by the payment of a small additional fee. Parcels may also be sent C. O. D., special delivery, or as first class mail.

Air Mail Service. In 1918 the regular use of airplanes was initiated by the United States government for the carrying of air mail. By 1969, each of the 50 states had air mail service and many foreign countries were included in regular air mail service with the United States.

Since the first air mail service, accomplished by the U.S. Army for the government in 1918 with one round trip a day between Washington, D.C. and New York, delivery and receipt of mail by air has grown immensely. From time to time, Congress has authorized increased air mail rates to help the Post Office department reduce operating losses. In 1977 the air mail rate for a letter was 13¢ an ounce and for an air postal or post card, 9¢ each, when mailed from any point in the U.S. to any other point in the U. S. or its possessions. The same air rates apply also to 1) first class letters and cards addressed in care of an APO and/or a Fleet Post Office for delivery outside the U.S., and 2) Canada and Mexico. The air mail rate to all countries besides Canada and Mexico is 31¢ for each half ounce. Aerogrammes may be sent by air to all countries and purchased at the post office for 22¢ each.

Dead Letter Office. Every year about 23,000,000 pieces of mail matter are received by the Post Office so carelessly or incorrectly addressed that they cannot be delivered. These are sent to the Dead Letter Office at Washington, D. C. where, by means of maps and directories, skilled clerks are able to guess correctly the destinations of about one-half the items. The others are opened and those with addresses inside are returned to the sender.

Currency, checks, and money orders amounting to more than $1 million are received annually. Merchandise which cannot be delivered or returned to the sender is sold at auction, letters are burned. and thousands of magazines, picture cards, and holiday cards are sent to hospitals. Insured parcels are held for six months; ordinary parcels for 60 days. Parcel sales are held periodically at each Dead Letter branch post office from two to six times a year. The fees from return postage from unclaimed packages along with the money which was inclosed in some of the letters amounts to about $250,000, which is only $20,000 less than the entire operating expense. The Dead Letter office originated in 1825.

Postal Service in Canada. The postal system of Canada is similar to that of the United States in its main features, and includes the services comprised under the headings of registration, insurance, money orders, postal savings, parcel post, and C. O. D. delivery systems. Rural free delivery was inaugurated in 1908, and an air mail service in 1927. The latter is of especial value in Canada in establishing communication between isolated settlements and the more populous portions of the country. Thus in 1929 an air mail route was established southward from Aklavik, which lies 300 miles within the Arctic Circle.

Telegraphic Communication. Postal communication depends for its speed on the available means of transportation. Although modern air mail service has effected great improvements in speed, it was preceded by Morse's telegraph, which began commercial operations in 1844.

The advantages of a land telegraph system quickly became apparent and in 1861 the first transcontinental system opened between San Francisco and New York. Telegraphic communication between water-separated places was first attempted in 1842 in New York harbor; by 1851, a line crossed the English Channel. After unsuccessful efforts, the first transatlantic cable was completed in 1866. Since then, 21 cables (about 1½" thick) have been laid in the North Atlantic. A lesser number cross parts of the Pacific Ocean.

Telephony. Vocal communication over long distances became possible when Bell invented the telephone in 1876. Improvements on the original device were made by many of the greatest inventors of the world. The advantages of the telephone have been so obvious that in the United States there is an average of one telephone for every 1.5 persons. Sweden has one telephone for every 1.6 persons. In the per capita use of telephones the following nations rank in order after the United States and Sweden: Switzerland, Canada, New Zealand, Denmark, United Kingdom, Finland, Norway, Australia, the Netherlands, and Japan.

Teletypewriter. A service was inaugurated in 1931 by which two-way communication by typewriter became possible over telephone or telegraph wires. By this system, two people, equipped with teletypewriters, on being connected through a central exchange, can converse in type, the words of both parties being recorded for future reference. This instrument, operating at about 60 words per

minute, is employed extensively also for one-way communication, where it is desirable to send the same message to numerous places throughout the country. Market quotations, financial news, and weather reports for airports are broadcast by wire in this manner.

Radio Communication. With the beginning of the 20th century, radiotelegraphy became a practical means of transmitting messages, so that ships at sea were enabled to keep in continuous communication with each other and with many stations ashore. Navigation became at once more safe and more accurate, because a captain could obtain the exact time and, during a fog, could usually obtain his bearings from a land station equipped with direction-finding apparatus known as the radio compass. All seagoing passenger ships must now be equipped with radio apparatus.

Long distance conversation by means of the radiotelephone became possible in 1915. Owing to developments made in the research laboratory of the American Telephone and Telegraph Company, the wire systems may be used in connection with the radiotelephone. By this method it is now possible to establish communication with a properly equipped ocean liner at sea from any commercial telephone in North America. On January 7, 1927, a regular transatlantic radiotelephone service was inaugurated between New York and London. This was followed by extensions which made possible direct vocal communication between any telephone in North America with any telephone in Europe. See *Cable, Submarine; Radio; Telegraph; Telephone; Phototelegraphy.*

Newspapers. The preceding articles have outlined the development of two-way communication. But of no less significance for the world's history is the growth of one-way communication from its primitive forms to the high-speed printing presses and radio broadcasts of the present day.

The prototype of the modern newspaper is to be seen in the *Acta Diurna* ("Daily Events") issued during the Roman Empire and posted in a public place. Copies were made by hand and dispatched to subscribers at a distance.

The invention of printing made possible the first genuine newspaper to be regularly published. It was the *Avisa Relation oder Zeitung*, printed first in 1609 in Germany. In 1622 appeared the first newspaper in England, *The Weekly Newes from Italy, Germany, etc.*, published in London. The earliest news sheet to appear in the Western Hemisphere was the *Relación*, issued in 1594 at Lima, Peru, but it was not until 1620 that a regular newspaper was published there. The first regular newspaper in British America was *The Boston News-Letter*, begun in 1704.

Before the days of the telegraph, enterprising newsmen employed carrier pigeons, fast ships, pony expresses, and even semaphore signaling systems for gathering news. With the rise of telegraph and telephone systems, this task was greatly simplified and was put on an organized basis. See *Newspaper Press Associations.* With the development of phototelegraphy, it has become possible to transmit news in picture form with practically the same speed as verbal messages. Improvements in printing presses make it possible now to issue editions containing latest news within a few minutes.

Broadcasting. Within the decade 1920–30, a second means of rapid dissemination of information grew into effective rivalry with newspapers. This was the system of radio broadcasting.

Experimental dissemination of speech and music from a central sending station to owners of receiving sets began some years prior to 1920. Lee De Forest was one of the leaders in this development. Station KDKA, operated by the Westinghouse Electric and Manufacturing Company at East Pittsburgh, Pa., broadcast the presidential election returns in 1920. The popularity of this broadcast led the way for a phenomenal increase in the number of receiving sets owned and for a corresponding increase in broadcasting stations. By 1940, there was an average of one radio receiving set for each 2.4 persons in the United States, and programs for every taste and purpose had become routine.

By utilizing telephone wires, chains of stations may be connected so as to send out identical programs. In this manner, nation-wide and world-wide "hook-ups" afford opportunities for statesmen, entertainers, or advertisers to reach the ears of millions of listeners. By 1940, there were 675 broadcasting stations in the United States. Canada and Russia ranked next in number, the total for the world being a little fewer than 2000.

Radio broadcasting has remained an important means of communication even with the introduction of television in 1939, when the first station (WRGB) began operating in Schenectady, New York. By 1976 there were 7,307 radio stations operating in the United States, a 110% increase since 1960. Television stations increased from 50 in 1950 to 961 in 1975. Nearly every city in the U.S. is served by one of the three major networks: the American Broadcasting Company, the Columbia Broadcasting System and the National Broadcasting Company. In addition, there were 152 non-commercial stations in operation at the end of 1975. By 1973, more than 368 million radios and 120 million televisions were in use in the U.S.

Communication Satellites. These are satellites of the earth which (1) have an approximately circular orbit and travel at such a speed that they remain a constant distance above a given point on the earth's surface and (2) are able to receive, amplify, and reflect electrical impulses produced on the earth by radio and television transmitters. By means of a number of such satellites properly spaced, impulses may be transmitted from any point on earth and reflected to any point without having to contend with difficulties created by the curvature of the earth's surface. The first such satellite designed as a part of this system was Early Bird, launched April 6, 1965. Since that time the growth of the communications satellite system has been spectacular. In 1975, 15 satellites were launched by governments, private industries and international organizations.

TRANSPORTATION

TRANSPORTATION is conducted chiefly by the use of vehicles operated upon the water, upon the land, and, more recently, through the air. Water transportation was early conducted by means of sailing vessels. Land transportation, except upon pack animals, required the construction of roads and railways, as well as the invention and improvement of appropriate vehicles.

Sailing Vessels. Long before the Christian era, the Egyptians, the Phœnicians, and the Greeks made use of sails to propel the small vessels of their time. To a large extent the Greeks, and especially the Romans, propelled by oars the ocean craft with which they navigated the Mediterranean. In the larger boats, called galleys, the oars were arranged in two or three rows or banks. The largest type of vessel widely used in ancient times for commercial or war purposes was the trireme, equipped with three banks of oars. The life of the oarsmen in these galleys was a hard one, and slaves were commonly employed. This practice gave rise to the term "galley slave."

The sailing vessels employed by the Venetians, Italians, Spanish, Portuguese, Danes, Norsemen, and the early English navigators were small craft, which seldom ventured far from sight of land. But beginning with the 14th century, the increasing use of the mariner's compass made it possible for sailing vessels to make voyages of great length.

According to present standards, the ships then employed seem small. Few people now living would willingly undertake a transatlantic voyage in a ship of the size of the *Mayflower*, in which the Pilgrims, early in the 17th century, came to their new home in America. But, in small sailing vessels of these or similar types, men in those days were making voyages halfway round the world, and, in a few instances, daring sailors circumnavigated the globe.

Steamships. The great revolution in transportation came when mechanical power was substituted for wind power on the ocean and for muscle power on the land. In performing the service of transportation, mechanical power was first applied to vessels. As early as 1787, John Fitch, a Pennsylvania farmer, propelled a boat on the Delaware by steam power. The *Charlotte Daudas* in 1802 towed two vessels of 140 tons 3½ miles an hour against a strong wind in the Forth and Clyde canal. Robert Fulton five years later ran the *Clermont* from New York to Albany by steam power and demonstrated the practical success of steam navigation.

A few years more were to pass before a vessel crossed the ocean entirely by steam power. The first transatlantic voyage of a steamer was the one made by the *Royal William*, which sailed from Quebec to the Isle of Wight in 1833. This was a wooden vessel, but in 1845 an iron steamer, the *Great Britain*, built by I. K. Brunel, a celebrated British engineer, was put in operation upon the transatlantic service.

The latter vessel is notable also because it was the first large merchant ship driven with a screw propeller. While its basic principle had long been known, the modern practical screw propeller was invented almost simultaneously in 1836 by Francis B. Smith, an English farmer, and by John Ericsson, a Swedish engineer.

Highways. The extensive use of vehicles upon the land could not precede the building of roads. The earliest road building on a large scale was carried on by the Romans. By maintaining order and by building permanent highways in the lands about the Mediterranean and in far-away Britain, the Romans made possible the development of Western civilization.

The first of the modern nations to undertake road building on an extensive scale was France. Beginning in 1597 under Sully, this progressive country proceeded to construct 15,000 miles of surfaced road. Colbert, who became prime minister in 1661, introduced the corvée system of forced labor upon the roads. The method was bad, but it gave France good roads in advance of other nations.

Two Scottish engineers, Thomas Telford and John L. McAdam, who did their work between 1800 and 1830, have fixed their names permanently to types of roads now largely built. Both men emphasized the necessity of providing adequate drainage for roads. Telford roads have a foundation of large broken stones surfaced by more finely broken or crushed rock; macadam roads are built without the foundation of larger stones. Hard surfaced roads are now constructed of the following materials: Sand clay, gravel, water bound macadam, surface treated macadam, bituminous macadam, cement concrete, brick and other block paving materials. The development of the motor car has given great impetus to road construction.

Canals. Canals are nearly as old as human history. The Assyrians built them. The Egyptians connected the Nile with the Red Sea by a canal. The Chinese are said to have constructed canals more than 2000 years ago. They built their Grand Canal, a system about 1000 miles long, in the 13th century. In the 15th century the famous artist, Leonardo da Vinci, invented the canal lock which was introduced into the canals of Milan. France began her existing system of canals early in the 17th century. England built her canals in the 18th century. In the first half of the 19th century numerous canals were built in North America.

Along with the construction of canals went the canalization of rivers until various countries, such as France and England, were equipped with a co-ordinated system of canalized rivers connected by canals. During the early development of the United States and Canada, however, it was impossible, because of physical obstacles, to create a fully co-ordinated system of inland waterways.

Railways, Steam and Electric. Before the system of inland navigation was completely worked out in the United States and Canada, the superiority of the railroad had been demonstrated. In 1829, the steam locomotive was perfected by the English engineer, George Stephenson, whose famous "Rocket" was successfully developed. By 1830, the Baltimore and Ohio, the Mohawk and Hudson, predecessor of the present New York Central, and a few other railroad systems began to operate in a small way. The completion of the Union Pacific in 1869 opened the first transcontinental span of railroad in America.

By 1890 the electric railway became commercially important for its passenger travel and cargo transport. Today, because of its cleanliness in operation and speed, it is utilized in mountainous areas throughout the world where hydroelectric power is available and on such heavily travelled passenger lines as in Washington and New York.

OCEAN TRANSPORTATION

Ocean Vessels in Colonial Times. The *Mayflower*, in which the Pilgrims came to America, was a typical sailing vessel of its time. It was a three-masted, square-rigged ship, only 100 feet long, and between 20 and 25 feet wide. It was registered as of 180 tons burden or, as it would be measured today, of about 160 tons gross register. Aboard this ship were 102 Pilgrims and the crew. The *Speedwell*, which started across the ocean with the *Mayflower* but which had to turn back, was only one-third the capacity of the *Mayflower*.

At the beginning of the 19th century, many ships were owned and operated by the merchant princes of America; as, for example, Elias Haskett Derby of Salem, Mass., and Stephen Girard of Philadelphia. The ships were square-rigged sailing vessels—ships and barks with three masts and brigs with two masts—of 100 or 200 tons register, a few being as large as 300 tons. The American merchants, lumbermen, planters, and fishermen of that period usually operated their own vessels instead of employing the services of common carriers. Derby, with his fleet of small sailing vessels, built up an extensive trade with the East Indies. Stephen Girard used forty sailing ships to carry on his trade with the West Indies and other parts of the world. The small vessels which these men used were well adapted to the service requirements of their time and brought fame and wealth to their owners.

Common Carriers on the Ocean. In American commerce, the common carrier on the ocean dates from 1816, when the Black-Ball Line was established from New York to England. Even in Great Britain the common carrier was hardly known until the beginning of the 19th century. For hundreds of years men had owned ships for hire or for charter to those who desired to use them, but transportation services on the ocean were not organized and conducted by common carriers until the early 1800s. The early common-carrier lines employed sailing vessels, but, from about 1840 in England and from about 1870 in America, steamship lines began to replace sailing vessels.

American Clipper Ships. In the 1840's the Cunard and other British companies began to use steamships and iron vessels. Thereupon the shipbuilders and seamen of America sought to increase the size and speed of the wooden sailing vessel so as to enable it to compete successfully with its new rival. Out of this competition grew the famous American clipper ships of the late 1840's and early 1850's. These were square-rigged sailing vessels, some of them between 2000 and 3000 tons gross register—fifteen times the size of the *Mayflower*. They derived their name from their long, overhanging prow and their sharp lines forward.

For a time the swift-sailing clippers held their own in competition with the steamship. But, as the marine engine became more efficient and iron and steel vessels of increasing dimensions were constructed, sailing tonnage rapidly declined. The last serious effort to enable the sailing vessel to maintain its place on the high seas was made at the close of the 19th century. About that time huge six- and seven-masted, steel-hulled sailing vessels of over 5000 tons register were built. Some of these vessels could carry 7000 tons of cargo.

Ocean Steamships. The steamship has had an interesting history. The marine engine, first successfully employed in the 1830's to propel vessels entirely across the Atlantic, was installed in wooden vessels with paddle wheels. English builders began to use the screw propeller for transoceanic service in the 1840's. It was more than a decade later before American builders substituted the screw for the less efficient paddle wheels. Indeed, even some of the British lines, such as the Cunard, kept to the use of paddle wheels until after 1860. The celebrated *Great Eastern*, completed in 1859, was equipped both with screw and with paddle wheels. This ship marked the transition from the older to the newer type of steam vessel. The *Great Eastern* was too large to be successfully driven by the engines of its day.

The Marine Engine. Most steamships are equipped with the inverted direct-acting marine engine. This type was used first in 1854, and most of the early engines were single expansion, although from the beginning some double expansion engines were constructed. The triple expansion marine engine made its appearance in 1881. However, it was not until 1894, when the *St. Louis* and the *St. Paul* of the American Line were built by the Cramps of Philadelphia, that the quadruple expansion marine engine was constructed.

During this same year, 1894, an entirely new type of engine, the turbine, was also applied to the propulsion of vessels. The first large ocean vessel to be equipped with turbines was the *Carmania* of the Cunard Line, built in 1905.

Source: U.S. Corps of Engineers.

The Diesel Engine. Earlier types of marine engines are, however, being displaced by an entirely different kind of engine, which is far more efficient and requires much less fuel. This is the internal combustion engine, named after its inventor, Rudolf Diesel. This engine has no boilers or furnaces but burns oil as fuel in the cylinders. The principal limitation upon the immediate use of the Diesel engine is its relatively large cost, but, in 1927, the tonnage of new ships being equipped with this type of engine exceeded for the first time that of steamship construction. See *Internal Combustion Engine.*

The Diesel driven engines were extensively constructed and used in World War II and proved so efficient that in 1948 practically every major railroad line in America had Diesel engines on order.

Ocean Leviathans. The large vessels of today have little resemblance to the ocean vessels of a century ago. The remarkable increase in the size of vessels is indicated by the developments of the first thirty years of the 20th century. The *Mauretania* (I), which began operation in 1908, was considered a marvel because she registered nearly 30,700 tons gross. She held the transatlantic speed record until 1929. In 1910 the *Olympic* was launched. This ship's length was slightly over 850 feet; its gross registered tonnage was 46,439.

Then, in 1912 and shortly thereafter, came the *Imperator* (renamed the *Berengaria*), the *Vaterland* (renamed the *Leviathan*), and the *Bismarck* (renamed the *Majestic*), all approximately 900 feet long.

The *Bremen* (1st), also about 900 feet long, was launched in 1929. It crossed the Atlantic in nearly 9 hours less time than the *Mauretania*. The first liner to exceed this length substantially was the *Normandie*, (renamed *Lafayette*), which was launched in 1932, and later burned in New York harbor. The greatest speed attained by any Atlantic (screw) steamship was 35.59 knots per hour in 1952 by the American-built liner *United States* on her passage from New York to Bishop's Rock in 3 days, 10 hours, and 40 minutes, a total of 3144 sea miles.

Oil Tankers. An outstanding development of marine traffic is the oil tanker. The evolution of super-tankers reflects increased world demand for petroleum products and a drastic reduction in transport costs. When the 38,000-ton *W. Alton Jones* joined the Cities Service fleet in June 1954, it was the largest tanker afloat. By 1960, the *Universe Apollo*, a 106,416-ton super-tanker built in Japanese shipyards by a U.S. company, exceeded in tonnage any other vessel. The largest super-tankers are now 1135 feet long, with a tonnage of 327,000 deadweight tons. Tankers of nearly a million tons are now on order. The world's tanker fleet has grown to more than 3,825 vessels and total capacity has risen to about 150 million tons. The super-tanker has been developed to transport more economically the oil products of the Middle East to the industrial powers. Japan is the world leader in construction of the tankers.

The majority of the world's tanker fleets are controlled by individuals such as the Onassis family and Stavros Niarchos, the Greek shipowners, and Daniel Ludwig, owner of National Bulk Carriers, Inc., an American firm. Major oil companies operate about 30 per cent of the fleet and national governments 10 per cent.

Although some countries may appear to have large merchant fleets most of the ships using their flags are owned by foreigners. The Liberian government, for example, requires only a small registration fee and an almost nominal annual charge. They maintain no control over the operation of ships flying the Liberian flag. Ships registered in Panama have the advantages of low fees and lenient labor laws.

The American Marine. The British colonists in America were a maritime people. They had to build ships in order to market their products in the West Indies and in Europe. With low-priced material for shipbuilding from the abundant forests, American shipping prospered until the Civil War.

During the Civil War there was a shrinkage of nearly a million tons in American shipping on the high seas. Four-fifths of this shrinkage was due to war losses and to the transfer of American vessels to foreign flags to escape the hazards of war. Moreover, this blow to the American marine came at the time when the steamship was taking the place of the sailing vessel, and when iron was supplanting wood in the shipyards of the world.

The American merchant marine of 1860 was composed largely of wooden sailing vessels; by 1870, the marine engine provided the steamship with a basis for superiority over the sailing vessel. The American marine began a decline that was to continue to the present due to the relatively high cost of shipbuilding and operation in the U.S. Generally, this reflects high labor costs and expensive material costs. Federal subsidization of construction and operating expenses amounting to 40 to 50 per cent of the total cost is required.

In 1975, the U.S. operated 3.9% of the world's 22,600 merchant vessels. In 1968, the U.S. operated 21.5% of the combination passenger-cargo vessels, 14% of the freighters, 8.7% of the tankers, and 2.8% of the bulk carriers. Of the 622,900,000 tons of cargo shipped and received by the U.S. in 1973, only 6.4% was carried on U.S. vessels. In 1950, U.S. vessels carried 39.3% of the much smaller total tonnage.

TYPICAL CARGO VESSEL, UNITED STATES MERCHANT MARINE

During the year 1935 the water-borne foreign commerce of the United States was valued at $3,786,000,000, of which 35.8 per cent was carried in American vessels and 64.2 per cent in foreign. If the commerce is measured by tonnage, however, the proportion of the total commerce carried in ships of American registry rises to approximately 40 per cent, indicating that a larger amount of goods bulky in relation to their value, such as grain and petroleum, are carried in American ships. These figures show clearly that, in the overseas commerce of the United States, American vessels in 1935 were playing a minor rôle. This rôle, which had diminished steadily since 1830, expanded remarkably during and immediately after World War I, then fell, but climbed precipitately during World War II.

TRANSPORTATION ON LAKES, RIVERS, AND CANALS

River Navigation. Long before men had the capital or the knowledge required for the construction of highways, and centuries before railroads were thought of, rivers and lakes were used wherever possible for inland transportation. Not only in ancient Egypt, Babylonia, and China, but in modern European countries, such as Austria, Germany, France, Holland, England, and others having navigable streams, the rivers were the only avenues over which traffic could move from interior points to seaboard markets.

For a long time rivers were used without improvement. Later their channels were improved by the removal of obstacles and, to some extent, by the construction of dams, locks, and canals past the rapids in the streams. The importance of rivers as avenues of inland transportation in Europe during the middle ages is indicated by the practices established by the feudal barons. These medieval rulers often maintained their power by constructing castles and barriers along the rivers. Possessing these strategic strongholds, they secured their revenues by exacting tolls from all those who used the streams for commercial purposes.

Canal History. As a result of improving their rivers and of constructing canals during the 17th and the 18th century, Holland, France, and England in turn acquired the economic leadership of other European countries. By building canals to connect their natural waterways, each of these countries was able to develop industrially, to accumulate capital, and successively to play an important rôle in international affairs.

Canal construction in the Netherlands required no special engineering skill, and it was to be expected that the people of that country would extend their numerous natural waterways by artificial channels. In countries like France and England, however, superior engineering skill was required. To France first credit must be given, for in that country as early as 1605, during the reign of Henry IV, construction was begun on the Briare canal to connect the Seine and the Loire rivers. It took until 1642 to finish the work. In 1675 the Orleans canal connected the same rivers by another route, and in 1681 the celebrated Languedoc canal was completed, connecting the Bay of Biscay with the Mediterranean. The summit level of this canal was 600 feet above the sea.

The greatest names in English canal history are Francis, duke of Bridgewater, and his engineer, James Brindley. The Bridgewater canal, connecting Manchester and Liverpool, was begun in 1759. During the succeeding 75 years one inland canal after another was constructed in England and Scotland until the principal streams of the island were connected by a network of waterways. Until after the middle of the 19th century, the waterways of Great Britain, France, and of several other European countries were far more important as freight carriers than were the railways.

Canals in the United States. River and canal transportation in the United States dates from colonial days. The first great leader in the development of inland waterways was George Washington. Washington was a surveyor, and the knowledge he gained in the French and Indian war, which took him as far west as the Ohio river, gave him a lifelong interest in waterways. In 1774, before the Revolution, he brought about the establishment of a company, chartered by Virginia and Maryland, for the improvement of the Potomac river. The ultimate purpose of this company was to connect the Chesapeake bay and the Ohio river by a canal, if possible, or at least by a portage road westward from Cumberland on the Potomac river.

The Revolutionary War interrupted the plans of the colonies for joining the Potomac and Ohio. However, upon the termination of the Revolution, Washington again returned to the prosecution of the project, only to be interrupted once more by being called to the presidency of the new republic. Much later, and in a different manner than Washington had planned, the Chesapeake bay and the Ohio river were connected by the construction of the Baltimore and Ohio railroad which reached Wheeling on the Ohio river in 1851. Forty years earlier, a highway, called the National Pike, had joined the two waterways.

The first man to plan a comprehensive system of inland navigation and of inland waterways and highways in the United States was Albert Gallatin, who for twelve years served as secretary of the treasury under Jefferson and Madison. In the year 1808 Gallatin made a report to Congress outlining

Name	Location	Length (miles)	Width (feet)*	Minimum Depth (feet)†	Number of Locks	Opened	Approximate Cost

*Width of locks or bottom of channel. †A depth greater than 20 feet indicates a ship canal. ‡Converted, 1926, from lock to sea-level canal. **300 feet minimum through the Divide.

in detail a plan for a system of inland waterways and of highways extending throughout the then settled portion of the United States. But again an armed conflict, the War of 1812, interrupted transportation development.

History of "Internal Improvements." During the War of 1812–15 the United States had great difficulties in conducting land campaigns. The practical failures of most of the land campaigns of that war made it clear to everyone that both military and economic considerations demanded the development of transportation facilities. The railroad had not been invented, and the public naturally turned to improving the rivers, constructing canals, and building highways. The movement for "internal improvements" was led by the ardent young statesman Henry Clay, and was supported by John Quincy Adams. For a time, leaders of the South, such as John C. Calhoun, advocated Federal support for canals and roads.

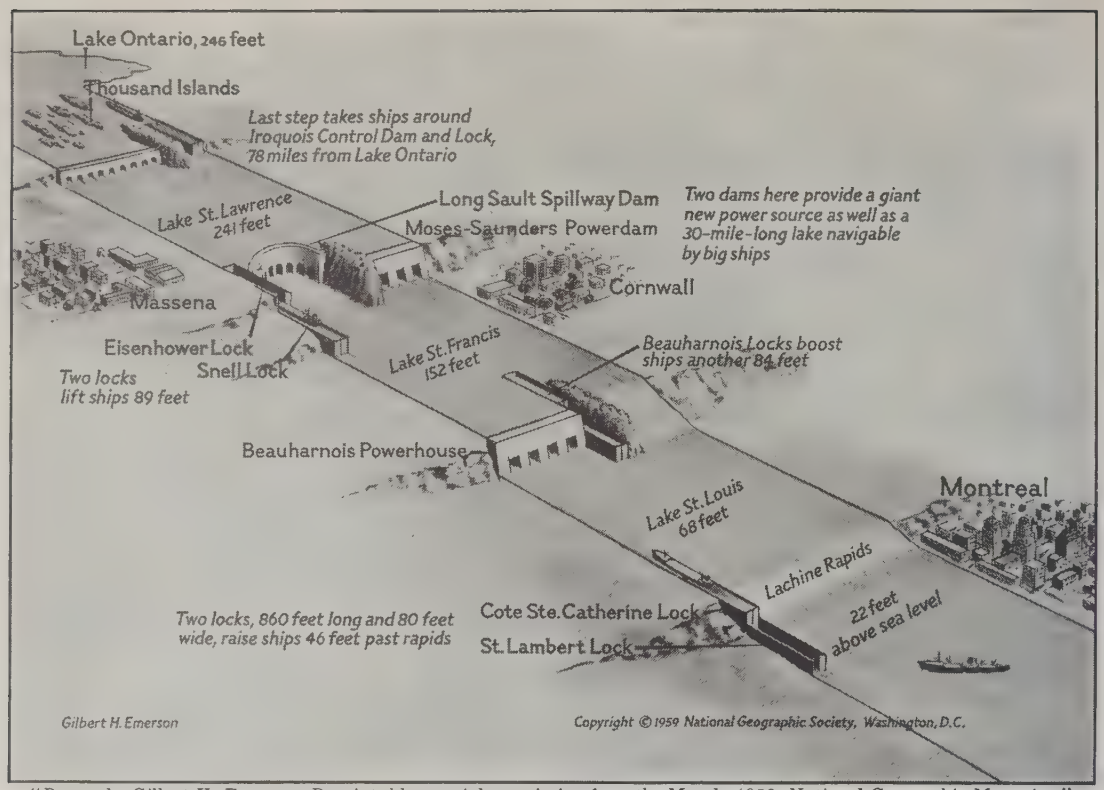
But, from 1820 on, the conflict over slavery and state rights caused the leaders of the South to oppose internal improvements by direct action of the Federal government. During the administration of John Quincy Adams, 1825–29, the Federal government gave active support to canal and road building. But after Andrew Jackson became president he supported the strict constructionists, and took the position that the Federal government could not constitutionally carry on works of internal improvement within the states. His popularity and powerful personality put an end to the policy of Federal aid for canals and roads.

During the year that Andrew Jackson was inaugurated president, the construction of railroads was begun in the United States. Within a decade it became evident that the railroads were to be efficient carriers of freight as well as of passengers, and that the inland waterways must at least share their traffic with the railroads. Indeed, as time went on, the waterways lost most of this traffic to the rival railroads. Nevertheless, the states which had begun works of internal improvements during the two decades following the War of 1812 continued to carry on such works until the Civil War and in some cases beyond that period. See table *Some Important Canals*.

River and Harbor Works. The Civil War settled the controversy as to the power of the Federal government. After 1865 no question was raised as to the power of the United States to expend funds upon the improvement of harbors, upon the channels of the Hudson, the Mississippi, the Ohio, and other rivers, and upon the connecting channels and the ports of the Great Lakes. From 1870 on, the Federal government regularly appropriated funds for rivers and harbors.

River Traffic. Railroads are now so generally used for freight traffic and passenger travel that it is hard to realize the great role played by the Mississippi, Missouri, Ohio, Kentucky, Tennessee, and other rivers, in the development of the country from 1840 to 1870. The steamboat, which began to run on the Hudson in 1807, made its appearance on the Ohio in 1811, and its use increased with the settlement of the Mississippi Valley states. St. Louis, on the Mississippi, near the mouth of the Missouri, became the principal trading city of the Mississippi valley, and New Orleans became the chief export city of the United States. The traffic of the great Middle West and of much of the South moved with the river currents to the Gulf, borne by the busy steamboats.

The Erie Canal. The canal which most influenced economic development in the United States was DeWitt Clinton's "Big Ditch"—the Erie



"Drawn by Gilbert H. Emerson. Reprinted by special permission from the March, 1959, National Geographic Magazine."

DIAGRAMMED STEP-DOWN OF SEAWAY IN ST. LAWRENCE RIVER

Canal—constructed by the State of New York from 1817 to 1825. By connecting the Hudson River and New York City with the Great Lakes via the Mohawk Corridor, it permitted the expansion of trade between the mid-west and eastern coast. New York City emerged as the great metropolis of the nation and its leading port. In the Midwest, the success of the Erie Canal stimulated the construction of numerous canals, notably in Ohio and Indiana. By the 1870's, competition from the railroads and rate wars caused canal traffic to decline.

New York State Barge Canal System. Presently, the Erie Canal is part of this System. The entire System, including the Champlain, Oswego, and Cayuga-Seneca canals in addition to the Erie, extends over 801.3 miles. The canals are at least 12 feet deep with a minimum bottom width of 75 feet when dredged through earth and of 94 feet where cut through rock. The 56 concrete locks built by the state are 300 feet long and 45 feet wide. The Federal lock at Troy is 44.4 feet wide. The largest barge that can be accommodated would be 300 feet long and 43 feet wide with a 4000-ton capacity.

The lock at Little Falls has a 40½-foot lift, one of the highest in the world. The five locks at Waterford raise a vessel 169 feet, twice as great as that to the summit of the Panama Canal.

Canals in Canada. Canada had an exceptional opportunity for the development of river and lake transportation by canalizing the St. Lawrence River and by connecting Lake Erie with Lake Ontario. The possibility of connecting Georgian Bay with the Ottawa River, and thus with the St. Lawrence River at Montreal, was also early apparent.

The St. Lawrence River has four rapids, which render upstream navigation impossible except by the construction of canals and locks along the river past the rapids. The Lachine Rapids are just above Montreal, and a canal past those rapids was begun in 1824. At later dates, canals past the other rapids of the river were constructed. These were equipped with locks 270 feet by 45 feet, and 14 feet deep.

The first Welland Canal, enabling boats to pass from Lake Erie to Lake Ontario, was opened in 1829. This waterway has been enlarged from time to time, and work completed in 1930 gave the waterway the dimensions of an ocean ship canal. In addition to one guard lock, there are seven lift locks, each of which is 800 feet in length by 80 feet in width, with a depth of 30 feet of water above the sills, each lock having a lift of 46½ feet. The canal connects Port Colborne, on Lake Erie, with Port Weller, on Lake Ontario. The total cost exceeded $122 million.

The St. Lawrence Seaway. The feasibility of a Seaway was studied in 1895 but not until May 13, 1954 was legislation signed authorizing the U.S. to join Canada in its construction. Congress acted after Canada announced plans to construct the Seaway within its boundaries. Passage of the bill was urged for reasons of national security.

The dredging of the St. Lawrence River and construction of locks and canals permits 27-foot draft ocean-going vessels (80 per cent of the world's shipping) to proceed beyond Montreal to Detroit and on to Duluth, Minnesota.

In 182 miles from Lake Ontario to Montreal, the river drops 224 feet. Canada undertook construction of facilities in the 68-mile section from Montreal to the International Rapids. The U.S. built the Wiley-Dondero Canal and three locks in the 46-mile International Rapids section between Cornwall, Ontario, and Ogdensburg, New York.

Another project, the joint development between

New York and Ontario in the International Rapids section of hydro-power facilities capable of producing 13 billion k.w.h. annually, began operations on July 1, 1958. The cost of the power project exceeded $600 million.

Chesapeake and Delaware Canal. In 1824, the Chesapeake and Delaware Canal Company constructed a canal connecting the Chesapeake and Delaware bays. This canal was acquired by the United States government in 1919. The Engineer Corps of the Army took in hand the work of improving the canal by the elimination of curves and the removal of locks, converting it into a sea-level canal. These improvements, completed in 1926, were calculated to reduce a ship's transit time from ten hours to four hours or less.

The Panama Canal. Encouraged by their success at Suez, the French sought to build a canal across the Isthmus of Panama. Under a concession from the Colombian government, work was begun in 1881. Unexpected physical obstacles and the prevalence of malaria and yellow fever caused the enterprise to be abandoned in the late 1880's. About this time an American company was considering the construction of a canal across Nicaragua, but this project, too, was abandoned and it became evident that if a canal was to be built it would have to be done by the United States government. As between the two locations, the United States in 1902 decided in favor of the Panama route after the French agreed to sell their interest for $10 million. In this same year Congress authorized the President to negotiate with the Colombian government for a concession to build the Canal. However, the two governments were far apart in their valuations of this permission. Colombia wanted $50 million and the United States considered the concession to be worth $10 million.

During the delay thus caused, the Republic of Panama declared its independence from Colombia. The United States promptly recognized the new government and made a treaty with it whereby permission was granted for building the Canal and for permanent occupancy of a strip ten miles wide along the canal route. The U.S. Secretary of War, assisted by a commission, began the construction in 1904.

This time, under the leadership of Col. Wm. C. Gorgas, measures were taken to prevent the diseases that had plagued workers on the French project. Sanitary precautions that eliminated disease-carrying mosquitoes made the Canal Zone completely safe from a health standpoint. U.S. Army engineer Col. George W. Goethals was equally successful in overcoming the many physical obstacles that had baffled the French. Both men were raised to the rank of Major General in recognition of their services.

The length of the Panama Canal is about 44 nautical miles or 50 statute miles. The minimum depth is 41 feet, and the minimum bottom width through the Divide is 300 feet. Navigation for most of the distance is in lake channels. A vessel passing from the Caribbean Sea to the Bay of Panama proceeds through a sea-level channel across the swamp district to Gatun, where by means of three locks the vessel rises to the level of the lake. Thence, the channel is through the lake to the Continental Divide, where, through a cut nine miles in length, the vessel passes to within a few miles of the ocean. At Pedro Miguel the vessel is lowered 30 feet to Miraflores Lake. Two locks at Miraflores lower the vessel to mean sea level.

Transit from sea to sea occupies 7 to 8 hours, with passage through the locks 3 to 3½ hours. In 1974 there were 15,269 transits carrying a record of 147,907,000 tons of cargo. Tolls on commercial ships totaled $119,419,878. The canal is operated and regulated financially by the Panama Canal Company, a governmental agency.

The total cost of the Panama Canal has been over $400 million. Under a new treaty signed with Panama in 1955, the United States raised the annuity paid Panama for the use of the Canal Zone from $430,000 to $1,930,000 annually and, among other concessions, agreed to return land no longer needed for canal operation. In 1974, a U.S.-Panamanian agreement set guidelines for the negotiation of a new treaty under which the Canal Zone would eventually revert to Panama.

The Suez Canal. The Suez Canal, connecting the Mediterranean with the Red Sea, was the first inter-ocean canal constructed. Begun in 1859 and opened in 1869, it was constructed by the Suez Canal Company under the leadership of Ferdinand de Lesseps.

This sea-level canal, 105 miles in length, is the world's busiest international waterway. Originally 26 feet in depth and with a bottom width of 72 feet, successive enlargements have given it a depth of 46 feet (capable of handling 35-foot draft vessels) with a minimum bottom width of 196 feet. The original cost was $80 million; total capital investment, approximately $136 million.

Canal use developed slowly since sailing vessels, the only ones employed in the Europe and Orient traffic in the mid-1800's, could not use the route. Traffic increased considerably with the introduction of steam vessels and stockholders realized dividends of 25 to 30 per cent. Approximately 176,000 shares of Canal stock, including that held by Egypt, were purchased by Disraeli for the British government in November 1875. The British government became the largest stockholder, although never controlling the majority of the 400,000-share stock.

Tonnage on the Canal increased from 20 million tons annually prior to World War I, to over 270 million tons in 1966. Nearly three-fourths of the northbound traffic is petroleum. The distance from the Persian Gulf to London via the Canal is 7000 miles; via South Africa, 12,900 miles. A 30,000-ton tanker saves over $100,000 by using the Canal.

The Canal company's 99-year concession was to revert to Egypt in 1968, but in July 1956 the Egyptian government seized and nationalized the Canal. Warfare followed in which Egypt was attacked by Israel, Britain, and France. From October 1956 until mid-April 1957, the Canal was closed while war-damage was being repaired. Since then Egypt has operated the Canal. From 1967 to 1975 the canal was closed due to the Arab-Israeli wars.

RAILROAD TRANSPORTATION

When in 1829 Stephenson succeeded in running "The Rocket" at the rate of 44 miles an hour in the contest at Rain Hill near Liverpool, England, he inaugurated a new epoch in the world's history. The effect of Stephenson's achievement was greater even than that of Watt, for the influence of the locomotive upon the industrial and social life of the world has been more fundamental than that of the stationary engine. The locomotive has made possible the rapid settlement and development of the continents of North and South America and of Australia, and is rapidly opening up Africa.

History of American Railroads. The railroad has had its most rapid and its largest development in the United States. The chartering of railroad companies in the United States began in 1826, and construction, on a small scale at first, soon followed.

The first locomotives were run in 1830. Several roads, the antecedents of the present Baltimore and Ohio, New York Central, and Pennsylvania systems, started at about the same time. The Baltimore and Ohio was chartered in 1827, and the first rail of this historic road was laid July 4, 1828, by Charles Carroll who was then the only surviving signer of the Declaration of Independence.

The Mohawk and Hudson, from which the great New York Central system has developed, was chartered in 1826. Construction was begun in 1830, and the first 17 miles of the line were opened in 1831. These early roads developed slowly, but Buffalo was reached in 1842. The Baltimore and Ohio reached Wheeling in 1851. The most active center of railroad construction in the 1830's was Philadelphia, which was connected with the Susquehanna River by rail in 1834 and thus with Pittsburgh by rail and canal lines. The Camden and Amboy connected the Delaware River with New York bay in 1837, and Baltimore was reached by rail in the same year.

Between 1830 and 1835 three lines were built out from Boston, one north to Lowell, one south to Providence, and the other west to Worcester. By 1841 this third line had been extended to Albany, and before the close of the following year one could travel from Boston to Buffalo by an all-rail route.

Periods of Railroad Construction. The historic growth of American railroads and the decline in mileage since World War I may be observed in the table *Railroad Mileage in the United States, 1845–1974*. Slow initial growth was followed by a 240 per cent increase in mileage in the decade 1850–1860. In no subsequent period did the railroads experience such a rapid rate of increase. In this decade prior to the Civil War, growth occurred principally in two regions, the South and the trans-Appalachian west. Vigorous railroad construction by the southern states provided them with the economic strength to wage four years of Civil War. The extension of northern railroads west beyond the Appalachian Mountains to the Mississippi River and to some extent beyond enabled the North to defeat the South.

From the close of the Civil War to 1880, rapid construction of railroads and the westward extension of the lines were plagued by intermittent panics. The severe panic of 1873, whose effects lasted for five years, resulted in large measure from the over-extension of railroads into the west in advance of traffic requirements. This distinctive railroad panic and its effects were ended by 1880.

From 1880 to 1890, more than 70,000 miles were added to the railroad network of the United States, the largest total in any 10-year period. Expansion occurred in all parts of the country but notably in the new states of the central west.

RAILROAD MILEAGE OF THE UNITED STATES BY STATES

been built. From that time on, most additions were built to supplement or extend existing systems. Peak mileage was reached in 1916 when the net extended to 254,037 miles. Since then, nearly 53,000 miles of line have been abandoned, primarily because of the growth of other forms of transportation. The change also reflects the decline in passenger traffic and efforts to economize by reducing redundant services.

Distribution of Railroad Mileage. Approximately 29 per cent of the railroad mileage of the world is in the United States. The combined countries of Europe have approximately 30 per cent and the remainder of the world 40 per cent of the total.

The mileage by state is given in an accompanying table. Texas, with 13,951 miles of railway, surpasses the mileage of France or Germany. New Jersey ranks first among the states in the number of miles of railroad per hundred square miles of area whereas Nevada has the lowest ratio.

Standard Gauge. The standard gauge of railroads is 56.5 inches from the inside of one rail to the inside of the opposite rail, measurement being made about ⅝ of an inch from the top of the rail head.

History of Canadian Railroads. In many respects the development of Canadian railways corresponds with that of the United States. As was the case in the States, the Canadian colonies devoted their attention first to canal building and the establishment of inland waterways. During the first half of the 19th century, these were the chief improvements made in transportation.

The first railway in Canada was placed in operation in 1836. This was a line 16 miles in length, connecting Montreal and St. John's on the Champlain route to New York. Up to 1850 only 50 additional miles of railway had been constructed. But the great activity in American railroad building during the 1840's convinced the Canadians that they too must have railroads to supplement their canals.

In 1849 the Canadian government adopted a vigorous policy regarding railway construction by undertaking to guarantee 6 per cent interest on a sum not to exceed one-half the cost of railways 70 miles in length or longer. As a result, the St. Lawrence and Atlantic railway, connecting Montreal and Portland, Maine, was completed in 1853, and, during the same year, the Northern railway from Toronto to Collingwood was placed in operation. In 1854 the Great Western railway, connecting Niagara and Detroit, was opened. The Grand Trunk railroad, chartered in 1852, operated the St. Lawrence and Atlantic under a lease, and, in 1856, completed the main line from Toronto to Montreal, thereby connecting the chief commercial districts of Canada with the Atlantic seaboard.

By 1860 more than 2000 miles of Canadian railways were in operation. These were constructed largely by heavy outlays of British capital. But the financial crisis of 1857, together with the pecuniary embarrassments of most of the lines, prevented extensive railway construction for the ensuing 10 years. Except for the completion of local lines, there was but little additional railway building until after the confederation of the various provinces of the Dominion was effected in 1867.

Fulfilling a condition of Confederation in the East, the Dominion government undertook the completion of the Intercolonial railway between the province of Quebec and the ice-free Atlantic ports of Nova Scotia and New Brunswick. In 1876, at a cost exceeding $20,000,000, this line was completed. A corresponding condition of western federation, demanded by British Columbia, was fulfilled by the construction of the Canadian Pacific railway. At a cost to the country of $62,000,000 in cash and 25,000,000 acres of land, this notable enterprise in railway transportation was begun in 1881 and completed in 1885. It is worthy of note that in the United States at this time only three transcontinental railway connections with the Pacific coast had been established. These were the Central Pacific, from Ogden to San Francisco, finished in 1869; the Southern Pacific, from the Texas seaboard to San Francisco, completed in 1877, and the Atchison, Topeka, and Santa Fé, from the Missouri river to Los Angeles, opened in 1885.

The railways of Canada have been built largely under various forms of government aid, consisting of land grants, cash subsidies, loans, and guarantee of bonds or interest. The total so granted, up to 1940, exceeded 47,000,000 acres.

Government Railways in Canada. A feature wherein railway development in Canada sharply differs from that in the United States is found in the large mileage owned or controlled by the national government. The Prince Edward Island railway, completed in 1875, and the Intercolonial railway, completed in 1876, were the earliest government owned lines. In 1903 the national government began the construction of the eastern division of the National Continental railway from Moncton, N. B., to Winnipeg. This line was to be leased to the Grand Trunk railway. Upon the failure of the latter to operate the new road after it had been completed at a cost of $165,000,000 up to 1919, the national government undertook its operation.

At the beginning of 1918 the Canadian government railways had a total mileage of 5150, comprising the Intercolonial, 2305 miles; St. John and Quebec railway, 128 miles; Prince Edward Island railway, 314 miles, and National Continental railway, 2403 miles. During 1918 branch lines in New Brunswick aggregating 143 miles were taken over for operation. In the same year the national government acquired the capital stock and control of the Canadian Northern Railway Company. The Canadian Northern system at this time had a total mileage of 9566 miles. With the later acquisition of various subsidiaries, including the Hudson Bay railway, the Canadian Northern system, as controlled by the government, comprised fully 10,000 miles of line. In 1920, the Grand Trunk Pacific railway, having a mileage of about 2700 miles, was taken over and operated by the government. The Grand Trunk railway, also, with about 3600 miles, was placed under government management in 1921.

In this manner the government acquired about 21,500 miles of railway; the total was increased to over 24,000 in 1935. This is over one-half the total mileage in Canada, which in 1973 amounted to 44,230, of which 90% is controlled by the government-owned Canadian National and the privately owned Canadian Pacific.

Technical Triumphs of American Railroads. The triumph of American railroads has been as significant in the development of equipment as in track construction. The success of U.S. railroading depended upon the ability to move heavy loads over long distances and over such grades as were

required to surmount the Appalachian and Rocky mountains.

In a country of three million square miles, resources are scattered and occasionally remote. The great distances and the diversity of economies and resources suggest the complex nature of the transport problem which the railroads solved. With major markets in the northeastern quarter of the country and on the west coast fringe, extensive transportation systems became a necessity. The wheat and corn of the mid-west and Great Plains must travel 1000 to 1500 miles to the markets and ports of the east. Vast quantities of coal move from the Appalachian fields by rail to the industrial centers of the interior; non-ferrous metals cross the nation from the mines of the west to eastern markets; and the forests of the west, south, and north-central states transport their products by rail to the rest of the nation.

Steam Locomotives. To provide transportation for the products of forests, mines, and fields, the steam locomotive was enormously increased in size and tractive power. From the tiny locomotives of the 1830's and 1840's, weighing from 5 to 20 tons, was developed the huge triplex articulated locomotive of recent years, which had 24 driving wheels and a total weight of 853,000 pounds. This extraordinarily large locomotive was intended for work on heavy mountain grades. But the standard freight locomotives, with eight driving wheels, had a total weight of about 500,000 pounds. The average tractive power of locomotives in the United States more than doubled in the first 40 years of the 20th century, being over 50,000 pounds in 1940. The number in use was 44,333. The maximum of 65,358 was attained in 1924.

Since World War II, however, there has been a sudden and dramatic change from steam locomotives to Diesel engines. By 1957 the railroads owned only 2,404 steam locomotives as against 27,211 Diesel units. Diesels now perform almost all freight, passenger, and switching service. The average traction power of over-the-road locomotives increased from 45,225 pounds in 1930 to 60,311 pounds in 1964.

The Car. Such heavy trainloads would not be possible except for the size and the strength of the freight cars now in use. At the close of the Civil War, the standard freight car had a capacity of about 20 tons. By the end of the 19th century the standard had been raised to 40 tons. The average capacity climbed from 42.5 in 1921 to 58.2 tons in 1964. The only limit to the size of the car is the strength of the tracks and bridges.

The Electric Locomotive. The earliest electric locomotive was used to haul cars in mines in 1882, but the most important early use of this form of traction was in subways and tunnels, where it has obvious advantages in the fact that electric locomotives do not emit smoke and noxious gases. The first tunnel in which electric locomotives were used was that of the City and South London Railway under the Thames River, opened for traffic in 1890.

Other situations in which electric locomotives have proved of value sufficient to justify the high initial cost are: in terminals and suburban divisions; on steep mountain grades; and on routes carrying heavy traffic and requiring fast service.

Diesel-Electric Locomotive. Although electrically driven, this type of locomotive does not require that tracks be electrified so as to transmit current from a central station. On the contrary, it generates its own current by means of a dynamo driven by a Diesel engine. The current drives motors geared to the wheels. The Diesel uses much less fuel than the steam locomotive. It also requires less maintenance and inflicts less wear and tear on tracks. It allows easier starting for heavy loads, and can maintain higher speeds for longer periods. The first Diesel-Electric locomotive for commercial use was built in 1925, the Jersey Central Railroad's No. 1000.

Streamlined Passenger Trains. The streamlining of passenger trains has the primary purpose of economy through reduction of air resistance at high speeds. A second advantage of molding the outline of locomotive and cars is to increase the beauty of the train as an attraction to customers. The first completely streamlined train in America was the "Zephyr," put into service by the Chicago, Burlington & Quincy Railroad on November 11, 1934, to run between Lincoln, Nebraska, and Kansas City, Missouri. Lightweight low-slung coaches able to take curves faster and cars with observation domes and with rubber used to make a smoother ride were other improvements designed to offset the attraction of transport by air, bus, and private automobile. In the years of explosive growth in travel, the number of passengers carried by railroads declined between 1950 and 1975 from 488 million to 269 million.

Competition with Trucks. In the years after World War II, the tonnage of goods hauled by trucks gained rapidly on the static or declining volume of goods hauled by railroads. The answer of the railroads was directed toward the twofold goal of cutting expenses and making its service more efficient and attractive. These developments included (1) discontinuance of uneconomic runs, with government consent, (2) conversion to Diesel locomotives, and (3) construction of larger and more specialized freight cars. These latter included cars adapted for transporting automobiles and particularly those which could carry truck trailers deliv-

INTERCITY FREIGHT TRAFFIC, 1930–1974*

ered to the railroad by trucks and delivered again to trucks to take them to their ultimate destination. This was known as "piggy-back" service; it represented a measure of co-operation instead of competition. Similar in effect was the increasing use of standardized freight containers that could be reloaded directly for truck, ship, or air transportation.

Other improvements by the railroads were (1) the use of machines in laying rails, which could be fused into lengths of 2000 feet or more, and (2) the use of computers to make up freight trains in switch-yards and to keep hour-by-hour record of where each shipment was.

TRANSPORTATION UPON ELECTRIC RAILWAYS

Tramways. The first electric railways were built to take the place of horse-car lines or tramways in the cities. The tramways had been preceded by bus lines, which began to run in New York City in 1830 and in Philadelphia the following year. It was not until 1832 that the first horse car was built in the United States. The first street railway in Boston dates from 1853, and, in Philadelphia, from 1858. Chicago's first line was started in 1859. These horse-car lines provided a service of four or five miles an hour, and were fairly adequate for the transportation needs of the times.

Cable and Elevated Roads. By 1870, more rapid transit than could be provided by horse-car lines had become necessary, and in one important city, San Francisco, steep hills made horse cars impracticable. The cable lines were the first to provide rapid transit. San Francisco opened a cable line in 1873, Chicago in 1878, Philadelphia in 1884.

In New York City, rapid transit was provided by the construction of elevated railways. The franchise for the first of these elevated railways was granted in 1867. Construction followed in due course, and by 1879 New York City had a fairly complete system of elevated roads. It was intended at first to use cable traction upon these elevated lines, but, before operation began, it was decided to use dummy locomotives. Twenty-five years later these steam locomotives were displaced by electric locomotives. Chicago began the construction of elevated roads in 1888; Boston, in 1903; and Philadelphia, in 1907.

Subways. The earliest underground railway for passengers was opened in London in 1863. It was operated with steam locomotives at first, but electric traction began to be used in 1890. The term "tube" is ordinarily applied in England to these railways. Budapest and Glasgow followed with the inauguration of electric train subways in 1896. A subway was opened in Boston in 1898. A subway service in Paris was initiated in 1900. The first line of the New York subway system was opened in 1904. Construction in this city presented peculiar difficulties. The subways had usually to be blasted through rock and, in certain sections, buildings of enormous weight had to be safeguarded while tunnels were driven beneath them. In later years, Philadelphia, Rochester, Toronto, Berlin, Tokyo, Moscow, Stockholm, and Montreal constructed transit facilities of this type. Chicago has a freight subway with a network of tunnels beneath the street level.

Technical Development. The electric railway was made possible by the dynamo, which was developed for practical use shortly after the middle of the nineteenth century. However, it was not until 1888 that an electric trolley line was actually demonstrated to be commercially practicable. After its introduction during that year, the electric railway made rapid progress in all cities. By the end of the century it had almost completely displaced horse-car lines.

Early in the 20th century, long-distance electric railway and electric interurban traffic developed rapidly and served as a decentralizing force. The increasing use of the automobile and motor bus, and the economic impact of the depression of the 1930's upon the over-extended lines resulted in their decline.

Transportation in Cities. The popularity of the private automobile caused a rapid and long decline in rapid-transit systems using electric power to carry people from one part of a metropolitan area to another. Transit companies in practically all cities converted to the use of buses, although electrically driven trains continued to operate in subways.

But the rapid growth of cities and the increase in car ownership produced transit difficulties of crisis proportions. Streets were widened; elevated roads were constructed; beltways were built around

many cities; even hours of work were staggered in some places to avoid traffic tie-ups at the rush hours. Space had to be found for parking the automobiles. One result was a trend for businesses to move into the suburbs.

The problem was attacked in some cases by a revival of public mass transportation systems. San Francisco began construction of a suburban electric rail system with maximum train speed of 80 miles an hour, the tracks going overhead in some places and underground in others. Montreal and Stockholm constructed subways. Los Angeles also began work on a rapid transit system. Many other cities proceeded to enlarge their existing surface systems or subways, including Chicago, Cleveland, Boston, Detroit, and Toronto. Tokyo put up a monorail system as a partial answer, and Seattle continued to operate the monorail trains used for its world's fair.

TRANSPORTATION ON THE PUBLIC ROADS

Highway History. In colonial days and until within a few decades, road building in the United States was carried on mainly by local governments. The work of construction was done by townships and towns in the middle and eastern states, and by counties and subdivisions of counties in the southern states. These local highways were mostly dirt roads and were not suitable for the handling of freight and passenger traffic between distant points. The first long distance or through-transportation highways were the turnpike roads, built by corporations chartered by the several states. The first important turnpike was the one from Philadelphia to Lancaster, Pa., begun in 1792 and completed two years later. Early in the 19th century, turnpike roads in large numbers were built in Pennsylvania, New York, and other states.

For a time the government of the United States gave aid to highway construction. Works of internal improvement then included highways as well as canals. But the policy of national aid to public highways came to an end in the 1830's, when it was held that Federal works of internal improvement were unconstitutional. By 1850 most of the states had come upon financial difficulties in attempting to build or aid canals, railroads, and highways.

Good Roads Movement. About 1890 a "good roads" movement started in Massachusetts, New Jersey, New York, and other states. Following 1910, this movement was powerfully re-enforced through the need for roads more suitable for motor vehicles, which by that time were coming into general use. The way had been prepared abroad, where the first asphalt highway was constructed in Paris in 1870 and the first cement highway was built in Grenoble in 1876.

Motor Trucks and Buses. The decade of 1920-30 saw public conveyances on the highways developed to the point of near approximation with the railroads in the transportation picture. This was due to improvements both in trucks and buses and in the highways on which they traveled. The highways were, of course, built at public expense. The federal government alone was soon spending a billion dollars a year to construct a system of national (United States) highways and assisting states and municipalities to improve their roads. Truck and bus lines were made subject to regulation by the Interstate Commerce Commission in 1935.

In 1940, the first motor toll road was opened, the Pennsylvania Turnpike, a divided highway with restricted entry and no traffic lights. It was followed by many others, constructed by state governments which expected to liquidate the cost by toll revenues. The private automobile was the beneficiary even more than the public conveyance.

The Motor Age. Before the mid-20th century, the private automobile had become a necessity rather than a luxury. Its appeal was irresistible, giving its occupants a sense of being at home wherever the car traveled. The result was more and more intolerable traffic congestion. Again the federal government stepped in.

In 1956, Congress passed the Federal Aid Highway Act authorizing expenditure of $33 billion over 13 years, primarily for a 41,000-mile system of *interstate* highways, multi-lane divided roads with limited access and engineered for maximum speed and safety. Ninety per cent of the cost was borne by the federal government, as was the case also for improvement of 190,000 miles of state roads and 510,000 miles of secondary roads. Gasoline and other taxes were imposed to produce the needed revenue. Traffic on the interstate system was enabled to pass between, into, and around the larger cities; railroad and highway crossings were eliminated by overpasses. The original cost authorizations were later substantially increased. Apart from the direct transportation benefits of lower operating cost of vehicles, increased safety, and saving of time for travelers and shippers, the system had an important impact on the pattern of economic life. The new highways attracted industrial, commercial, and residential development with consequent enlargement of economic opportunities.

TRANSPORTATION BY AIR

Early History of Aircraft. The earliest *attempts* at flight were made with craft heavier than air. This fact was probably due to the every-day example of the flight of birds.

The Greek inventor Archytas is said to have constructed, about 400 B. C., a wooden pigeon which maintained itself for a short time in the air. About 1500 A. D., Leonardo da Vinci constructed models of helicopters, with propellers rotating in a horizontal plane, which hovered in the air. He is, therefore, properly credited with the invention of the helicopter and also of the propeller with rotating blades. He first conceived also of the parachute and he drew plans for ornithopters, that is, for aircraft to be propelled by flapping wings. These were to be operated by the arms and legs of the aeronaut. Many later inventors continued to experiment on these lines despite the fact that Giovanni Borelli (1606-79) pointed out that man's pectoral muscles have less than one-tenth the power possessed by the wing-operating muscles of birds when the weight of the body is taken into consideration.

Attempts at gliding are said to have been made in Rome in the time of Nero. About 1660, a French acrobat named Allard undertook a gliding flight in Paris before Louis XIV. These and many subsequent attempts ended in injury or death to the would-be aeronauts.

Aeronautics. Mechanical flight is pre-eminently a development of the 20th century. Its success demanded the improved gasoline engine, a light, strong metal, such as duralumin, and a knowledge of air dynamics. These discoveries led to the evolution of the airship from the balloon and to the building of successful heavier-than-air machines, or airplanes. See *Airplane* and *Airship*.

The flight of an airplane is analogous to that of a kite. The string by which the kite is drawn forward corresponds to the forward drive of the propeller, and the upward pressure of the air on the kite corresponds to the lift exerted on the wings of the airplane. This lift is due partly to the pressure exerted on the under side of the wings, and partly to the suction caused by a partial vacuum on the upper side of the wings. Neither surface of the wing is flat. The cross section of the wing follows certain streamline designs which are a balance between three requirements—maximum lifting power, strength, and minimum resistance in passing through the air. The last mentioned requirement demands also that the body of the airplane should conform to streamline design.

To exert effective lifting power the wings must be driven forward at a certain minimum speed and must be inclined upward at an angle of from 2° to 20°. Below this limit, or above it, the air resistance, or "drag," causes the plane to "stall;" that is, to fall below the minimum speed necessary for horizontal flight or control. The minimum speed required to keep the average plane in the air is about 35 miles an hour. Airplanes driven by piston engines travel from 200 to 350 miles per hour at top speed. But those propelled by jet, which were introduced into commercial flying in the 1960's, attain speeds of from 500 to 600 miles per hour. This velocity approaches the speed of sound, which is approximately 770 miles per hour. Plans soon were laid for introducing supersonic turbojet planes which would operate at nearly 2000 miles an hour.

The jet planes are pushed forward, not by revolving propellors pressing against air, similar in principle to the screw of a ship, but by thrusting backwards an explosive mixture of compressed air and fuel. Their propulsion is independent of air. Hence at high altitudes, up to 42,000 feet, where air is rarified and presents much less resistance to the plane's forward movement, far greater speeds can be obtained with the same expenditure of fuel. This is the chief factor in making their flight more economical.

The mechanisms for stabilizing the airplane's course include a vertical tail fin and a horizontal tail plane. Control of its course is effected through an "elevator," jointed to the tail plane, a rudder, jointed to the fin, and ailerons, or adjustable wing flaps. Landing on rough ground is facilitated by the use of pneumatic tired wheels on axles fitted and designed for maximum shock absorbing capacity.

While the control of an automobile involves only two main factors—speed and steering in a horizontal plane—the control of an airplane involves at least two additional factors. One is steering in a vertical plane; that is, going upward, downward, or on the level. The other is maintaining an even keel; that is, avoiding undue tipping, or "banking." Most planes have a so-called stick control. Moving the "stick" forward or backward causes a fall or rise in height; moving it sideways causes tipping to the right or left. Steering right or left is accomplished by a foot bar.

Important Dates in Aircraft History.

Aug. 27,1783—Hydrogen first used in a balloon by Prof. J. A. C. Charles, of Paris.

Jan. 7, 1785—The first crossing of the English channel in a balloon, by J. J. Blanchard, a Frenchman.

Jan. 9, 1793—The first ascent of a balloon in America, at Philadelphia, by J. J. Blanchard, in the presence of George Washington.

1848—The first power-driven airplane which actually flew, a 9-pound model, steam-driven, constructed by John Stringfellow, an Englishman. It flew 120 feet.

Dec. 17, 1903—First successful piloted flight in a power-driven airplane, at Kitty Hawk, N.C., by Wilbur Wright, 120 feet in 12 seconds. Nine days previously Samuel P. Langley's 'aerodrome" had crashed in a take-off, but was later proved capable of flight by Glenn Curtiss and flown successfully at Hammondsport, N.Y. Sept. 17, 1914.

1904—The first airship built in the United States, the *California Arrow*, by Captain T. S. Baldwin.

Aug. 22, 1906—First successful flight in Europe and first in the world without launching aids, by Alberto Santos-Dumont at Bagatelle, France.

July 25, 1909—First airplane flight across the English Channel, by Louis Bleriot, 20 miles in 37 minutes.

June 22, 1910—The first flight of an airship on a regularly operated transportation service, by Count Zeppelin at Friedrichshaven, Germany.

May 15, 1918—First regular air mail route in America inaugurated, between New York and Washington.

June 14, 1919—First non-stop transatlantic airplane flight, by Alcock and Brown, Newfoundland to Ireland, 1936 miles in 15 hours, 57 minutes.

1924—First aerial circumnavigation of the globe, by United States Army planes in 175 days.

1930—Development of "blind flying."

1931—Aerial circumnavigation of the earth in 8 days, 15 hours, 51 minutes, by Post and Gatty, as compared with the first circumnavigation in 1519 by Magellan, which required 37 months.

1934—First west to east crossing of the Pacific, by Sir Charles Kingsford-Smith and Capt. P. G. Taylor, 7365 miles in 51 hours flying time.

Nov. 1935—First transpacific air mail service—San Francisco to Manila.

June 17, 1939—Transatlantic passenger service inaugurated between U.S. and Europe.

1940-45—World War II mass production of aircraft; emergence of the helicopter as a useful craft; development of jet aircraft and V-2 rockets by German scientists.

1950-53—Korean War saw the military use of advanced jet aircraft.

1953–57—Development of turbo-prop, turbo-jet, and pure-jet commercial aircraft; experimental VTOL (vertical take-off and landing craft) introduced; advanced development of military rockets and missiles.

1958—First U.S. commercial jet aircraft capable of speeds up to 615 mph and reducing flying times by nearly one half.

1965–67—Pilot studies by the United States and jointly by France and Britain for development of commercial supersonic planes.

1968—The U.S.S.R.'s supersonic transport (SST), TU-144, designed to travel at 1,550 mph and carry 135 passengers 4,000 miles, made its first test flight.

1969—The Concorde, a British-French supersonic airliner designed to carry 140 passengers at 1,450 mph, made its first test flight. The Boeing 747 "jumbo" jet, with a 490-passenger capacity, made its first public flight—from Seattle to New York.

1973—The British-French Concorde landed in the U.S. (Dallas-Ft. Worth Airport) for the first time.

1974—The Concorde set two records: from Paris to Boston in 3 hours, 9 minutes; from Boston to Miami in 80 minutes.

Air Travel. Air transportation is mainly passenger transportation, although carrying of mail has played a large role in development of the line. Volume of air freight is insignificant in comparison with passenger traffic.

The development of air travel was slow at first since it represented such a sharp break with past habits. Fear had to be overcome by confidence based on proven safety. European airlines, with government subsidies, progressed rapidly in the 1920's. In 1930, Congress authorized air-mail subsidies, and the routes selected by the postmaster general helped develop the pattern of routes which formed the basis for today's system. The government established beacons and radio stations for the guidance of fliers. Terminals were constructed by municipalities, usually with government assistance.

Established in 1938, the Civil Aeronautics Board was given broad powers to regulate nonmilitary flying and to lend assistance to commercial airlines. This law and the sale of surplus military aircraft after World War II provided the impetus for a crescendo in air travel which, by the 1960's, placed it at the head of all forms of travel except the private automobile. Transoceanic air passengers far exceeded in number those using ships. The use of private planes also grew apace. Traffic congestion at the larger airports became a serious problem.

Airplane safety depends on numerous sophisticated instruments. The pilot uses a radio range instrument to keep to a course marked by a radio beam, any deviation from which is registered on the panel instruments. An "omnibearing instrument" gives him his exact location. When he is near an airport landing, his instrument landing system enables him to follow a radio beam sent from his landing point. At the airport, a control officer, by means of radar, is made aware of every aircraft within range and issues instructions for orderly landing.

Planes that fly above 10,000 feet are equipped with pressurized cabins. Those going more than 25,000 feet are equipped with separate facilities to distribute oxygen to all occupants should the pressure system fail.

Commercial Air Transportation. At the end of the second decade of commercial air transport in the U.S. in 1940, the airlines were transporting about 3,185,278 passengers per year. This number rose to 126,700,000 by the early 1970's. Also at that time, approximately 750 airlines were in operation in the world. Their air routes covered over 9,670,000 miles, with an estimated 236,750,000 passengers per year.

Federal Control. Federal promotion and regulation of civil aviation are carried out by two bodies—the Civil Aeronautics Board and the Civil Aeronautics Administration. The Civil Aeronautics Board is an independent agency concerned primarily with the issuance of certificates of public necessity, economic regulation, the formulation of safety regulations, and the investigation of accidents in civil aircraft. The Civil Aeronautics Administration is an operating agency of the Department of Commerce. Its principal activities are the building and operation of air navigation aids and the enforcement of safety regulations.

TRANSPORTATION VISTAS

The demand for fast transportation in a world rapidly filling with people pointed by the middle of the 20th century to intolerable traffic congestion on highways and in the air. Radical new methods came under study and testing. Some of these are described below.

Air Cushion Vehicles (ACV). These operate on the principle of the jet. Air is forced downward so as to exert a lift on the car or boat sufficient to free it of contact with the surface of the ground or water. Propulsion also is by jet action.

This type of craft was invented by the British engineer Christopher S. Cockerell. His air-cushion boat, the hovercraft, was demonstrated successfully with the financial aid of the National Research Development Corporation of Great Britain. A land vehicle was developed also to follow a rail in the form of a V.

In France, a so-called aerotrain (or tracked ACV) was built which uses a rail embedded in the center of a smooth reinforced concrete roadway. This rail also fits into a deep groove in the car but, when the car attains operating speed, does not touch the surfaces of the groove. Jets of air prevent the contact. Thus there is no friction either with the roadbed or the rail. In 1967 an aerotrain reached a speed of 215 mph; a speed of 300 mph is considered a feasible maximum.

In the United States a similar vehicle known as the levacar was constructed by the Ford Motor Company in 1961. It, however, utilizes two rails instead of one but is raised so as to have no direct contact with them, as in the aerotrain. A possible speed of 500 mph was claimed for it.

Train in a Tube. A more radical device worked out by the Lockheed Corporation replaces the roadbed and guide rails with a giant tube within which the vehicle is propelled. The car would be fitted with precision to the walls of the tube. No attention is paid to getting rid of friction since at high speeds this would be at a minimum. The work of the engine is to take the air ahead and force it at great pressure to the rear. This jet effect would propel the car at a speed which theoretically could be supersonic.

Another device, using both a tube and air cushion, is one developed by the Rensselaer Polytechnic Institute. The air cushion centers the car in the tube so as to avoid contact with the walls of the tube, and the car is propelled by sucking in the air ahead and ejecting it in the rear.

The RRollway. This word is formed from "railroad" and "tollway." It is applied to a proposed electric train of cars about 24 feet wide operated on four tracks. Its purpose is to provide a rapid mode of transporting passengers and also, if they wish, their automobiles, which can be driven in and parked transversally across the car. The width of the track assures stability. Speeds up to 300 mph are envisaged. Operation would be automatic by computer so that a service as frequent as one each 90 seconds could be maintained. According to the developer, General American Transportation Corporation, the terminals would be outside cities in view of the wide tracks required and the requisite large areas of the terminals.

LABOR RELATIONS

SINCE the days of feudalism, much of the world's work has been done under what is known as the system of free contract which means that the employee delivers his work to his employer for a stipulated price. Forced labor, as under slavery, and labor exacted as a duty because of social status, which prevailed under feudalism, theoretically at least have no part in labor relations today among democratic nations.

Before the rise of large-scale industry, as on many farms today, the relation between employer and employee was close and personal. But as the small property owner yielded to the large corporation as the typical employer, the relation of employee to employer became rather that of production worker to manager with personal acquaintance replaced by rules and policies. In a corporation, the management itself consists of employees of the corporation. Its interests, however, lie chiefly with the owners of the corporation rather than with the production workers. This fact provides the setting for the problems of labor relations in industry.

Management and Workers. The interests of management and workers conflict in so far as each group seeks to obtain a larger share of the revenue of the enterprise. Their interests overlap, however, in that neither could operate the enterprise without the aid of the other and both stand to prosper by enlarged revenue. Under normal conditions, ownership and management have the initial advantage in that they do not need workers as much as the workers need them. That is to say, the workers are usually much more dependent upon the weekly or monthly pay check than the owners of capital are upon profit or dividends from business. The owners are likewise able, as a group, to employ their superior money resources as a purveyor of power through political activity, use of the courts, and publicity. To offset this advantage, workers eventually built up strong organizations—labor unions—to mobilize countervailing economic and political power.

Role of the Government. For these reasons the labor problem in an industrialized nation enters vitally into government itself. Two groups, one wealthier and the other more numerous, compete for control. But the government, which represents all other interests as well as these, has a primary concern in seeing that industrial peace is preserved, that production and distribution of goods and services are promoted and that causes of strife are kept to a minimum. The government also has an interest in seeing that the health and the physical and mental well-being of its citizens are not impaired by substandard conditions of work, prolonged unemployment, and discriminatory employment practices.

INDUSTRIAL CONFLICT

In the early 19th century, the legal relation of employer and employee was still that of master and servant, a relic of the feudal system. Concerted action by employees to obtain better wages or working conditions was punishable by the courts as conspiracy, for which prison sentences might be imposed. In 1842, however, the Supreme Judicial Court of Massachusetts, then perhaps the most influential court in the country, ruled that employees might lawfully organize for mutual aid.

This right was slow in obtaining recognition. Its practical exercise, however, and the use of it to better the conditions of labor provide the key to most of the economic conflict between capital and labor both before and since.

The ultimate weapons of industrial conflict are the strike on the part of employees and the lockout on the part of employers. These simple forms of economic pressure, however, are usually supplemented by other actions intended to break the resistance of the opposing parties. Strikes, cessation of work by a group of employees until certain issues are settled, are usually accompanied by picketing and may be supplemented by boycotts. In the past, especially in the late 1930's, the stay-in or sit-down strike technique was used. Lockouts are much rarer than strikes. Most employer action in industrial disputes, therefore, takes the form of combating strikes.

Early History of Unions. The first recorded strike in America took place in the colonial period, when in 1741 New York bakers quit work as a protest against a municipal ordinance regulating the price of bread. The earliest known strike for higher wages took place in 1786, when the Philadelphia printers ceased work as a means of enforcing their demand for a minimum weekly wage of six dollars. A sympathetic strike took place in 1799, when the shoemakers, belonging to the organization known as the Federal Society of Journeymen Cordwainers, were compelled to lay down their tools in order to aid the bootmakers, who were seeking an increase in wages. This action may be regarded also as the first *organized* strike in America. Sympathetic strikes, however, did not play an important part in industrial disputes until the last two decades of the 19th century.

A successful attempt to establish a 10-hour working day was made by the unions of Philadelphia in 1835. Fifty-one years later, in 1886, occurred the first nation-wide strike for an eight-hour day.

Many trade unions were formed in the period between 1792 and 1810, especially in the cities of New York, Baltimore, Philadelphia, and Pittsburgh. The first central organization of trades in one city was formed at Philadelphia in 1827. It was called the Mechanics Union of Trade Associations.

In 1833, there were 29 organized trades in New York City. Many of these affiliated to form the New York Trades Union. Similar organizations followed quickly in other cities, so that when a convention was called in New York in August 1834, delegates were present representing the trades unions of Boston, Brooklyn, Philadelphia, Poughkeepsie, New York, and Newark. At this convention was inaugurated the National Trades Union. A trades union, comprising as members *unions* in various trades, must be distinguished from a trade union, which comprises as members *individual workers* in *one* trade only.

The printers were apparently the first craft to unite their local units into a national association, so that the Typographical Union, organized in 1850, is the oldest *national* trade union in America. The Stonecutters effected a national organization in 1853; the Hat Finishers, in 1854; the Molders, and the Machinists and Blacksmiths, in 1857.

In addition to unions of the workers in a particular trade, two organizations on a national scale arose prior to 1870, each of which admitted workers of any trade. The first was known as the National Labor Union, founded in 1866. The second, established in 1869, was called the Noble Order of the Knights of Labor. It began as a secret society, but the policy of secrecy was abandoned in 1878. Dissensions within these organizations led, in 1881, to the formation at Pittsburgh of the Federation of Organized Trades and Labor Unions of the United States and Canada. This federation merged with a separate trade union conference on December 8, 1886, forming the present American Federation of Labor. In 1889, the new federation recognized the continuity of its existence by dating its records from 1881.

Strikes. A strike is a concerted cessation of work on the part of the employees to compel an employer to meet their wishes as to wages or other conditions. It is a two-edged weapon, however; sometimes it cuts three ways. While its purpose is to cause loss to the employer, it also cuts off earnings of employees and may entail serious consequences for the public.

To enable employees to stand the loss of wages, labor organizations usually accumulate strike funds from which payments may be made to needy strikers in the form of strike benefits.

When the effect of strikes on the public goes beyond mere inconvenience and threatens disorganization of customary ways of living, as when electric power is cut off, the government is likely to intervene. Some states make strikes against public utility companies unlawful. The Federal government has the power by law to delay strikes which the president finds to imperil the public health or safety.

Sit-down Strike. This is a term applied when strikers, instead of leaving their jobs, remain at their places and refuse to work. Such action amounts practically to taking over the shop. When first used, in 1937, the sit-down strike brought workers some conspicuous successes, but in 1938 it was held by the U.S. Supreme Court to be illegal, and participants were deprived of the protection of Federal labor laws which they would otherwise have enjoyed.

Sympathetic Strike. This is a strike called by a union against an employer with whom the union has no quarrel, the purpose being to aid a sister union involved in a dispute with another employer.

Picketing. The picket line is the commonest means of adding to the effectiveness of a strike. It usually takes the form of a file of strikers carrying signs near a plant entrance, the signs conveying in simplified form the strikers' version of the dispute. The signs, for example, may read, "Unfair to organized labor." Sometimes sound trucks are pressed into service to give the public a more detailed account of the strikers' case.

The effectiveness of a picket line may be much greater than the number involved would lead one to expect. This is because crossing a picket line is regarded by large numbers of people as a species of treason to the employee class or the labor movement. The picket line helps to make a strike complete.

When feelings run high, picketing may become much more than an advertisement of the strikers' case. The pickets may attempt forcibly to prevent nonstrikers or customers from entering the employer's premises. This is sometimes known as obstructive or violent picketing as opposed to peaceful picketing.

Peaceful picketing has been declared by the United States supreme court to be a right protected by the Constitution as a form of free speech. On the other hand, courts ordinarily take the view that violent picketing is unlawful and may be forbidden by injunction. Even peaceful picketing when engaged in for unlawful purposes falls under the ban of many laws which define such purposes.

Boycotts. In addition to picketing, unions frequently seek to exert pressure on employers with whom they are in controversy through destroying their markets by means of boycotts. That is to say, members and others are asked not to patronize the employer concerned.

Secondary Boycott. A boycott is secondary when it is aimed only indirectly at the employer with whom the union has a quarrel. It seeks to reach him by forcing his customers, suppliers, or employees to cease doing business with him until he consents to what the union wants. An example would be picketing a radio store to prevent it from handling radios made by a company against which the union was striking. Such tactics are forbidden by Federal law and by some state laws.

Union Label. The use of a special label for goods made in factories where labor is unionized is another form of aiding a consumer's boycott. In another sense it is a form of advertising so as to permit preferential buying, comparable to the plea to "buy home goods."

Strikebreaking. The usual strategy of the employer in combating a strike, the picket line, and boycott is to attempt to operate his business with nonstrikers or new employees and weaken the morale of the strikers. Injunctions against illegal picketing and boycotts may be sought.

If the strike is "economic," that is, not motivated by the employer's unfair labor practices, the employer may lawfully seek to replace the strikers by new employees. Otherwise, the strikers may be entitled to job reinstatement with regular pay for the time they were on strike. For this reason, employers have largely abandoned the cruder forms of strikebreaking formerly used. In most large strikes, there is no attempt to operate until the dispute is settled. But sometimes picketing continues even years after the business has been operating normally.

LABOR INJUNCTIONS

It is impossible to understand industrial conflict without appreciating that, while the objective of employees is better pay and working conditions, these can be achieved as a rule only when the employees are able to act together effectively. Only by concerted action can strikes, picketing, or boycotts be made into effective instruments.

For this reason, in the earlier stages of the industrial age, employers' efforts to combat employee demands were aimed at preventing employees from organizing. One method used was to insist that new employees sign what came to be called "yellow-dog contracts." These were undertakings not to join a labor organization on pain of discharge. Even without such contracts, many employers considered membership in such organizations ground for discharge.

When conflicts came into the open through strikes and picketing, the weapon of court injunctions was relied on. An injunction is a court order usually issued to prevent the violation of someone's right. If it is disobeyed, the violators may be punished at the court's discretion through fines or imprisonment.

The first labor injunction by a Federal court was issued in 1885 (*U. S. v. Kane*) to prevent an act threatening a bankrupt property which was directly under the guardianship of the court. This precedent was extended to protect private property rights in the case of Casey v. Cincinnati Typographical Union, decided in 1891. Thereafter injunctions were used freely to prevent picketing and other strike action, frequently without the union being notified or given a chance to reply.

Antitrust Laws. In 1890 Congress passed the Sherman Antitrust act designed to break up combinations of capital. Combinations in restraint of interstate commerce were made subject to injunctions and to suit for triple damages by persons injured by such combinations. This law was utilized to prevent picketing and boycotts where interstate commerce was affected.

The supreme court of the United States, in 1906 and 1908 respectively, decided that a boycott conducted by a labor union against goods of a manufacturer with which the union has a dispute and a boycott against retailers buying from such a manufacturer fall under the prohibitions contained in the Sherman act. (See *Buck Stove and Range Case* and *Danbury Hatters' Case.*) The Clayton act, amending the Sherman act in 1914, provided that the antitrust laws should not apply to labor unions acting lawfully in pursuit of their legitimate purposes. The courts held, however, that action which interfered with interstate commerce was not part of the legitimate activity of unions, thus leaving the earlier decisions of the supreme court in effect.

Norris-LaGuardia Anti-Injunction Act. This act, passed in 1932, attempted, among other things, to do what the Clayton act failed to do. It forbids Federal courts to issue injunctions in labor disputes except under narrowly defined circumstances. The result was that labor organizations were to a large extent freed of injunctions issued by Federal courts. A seeming exception was the 1947 injunction to prevent a coal strike, but this applied to a government-operated industry.

Injunctions Under Taft-Hartley Act. The Labor-Management Relations act, 1947, popularly known as the Taft-Hartley act, punched at least two holes in the Norris-LaGuardia act. First, it allows injunctions in labor disputes at the instance of the National Labor Relations Board (NLRB), an agency established for regulating labor relations. This federal agency is *required* to seek orders to stop secondary boycotts and certain other kinds of "unlawful" acts by unions, and is *permitted* to seek such orders to stop "unfair labor practices." (See *Taft-Hartley Act* below.)

The other major modification in the Anti-Injunction act is a provision of the Taft-Hartley act under which the attorney general of the United States may obtain injunctions to delay up to 80 days any strikes found by the president of the United States to affect the public health or safety.

RIGHT TO ORGANIZE

As stated above, a key objective of employees in industrial conflict is the right to organize for mutual aid and protection. The chief obstacles to the exercise of this right have been these: (1) the discharge of employees known to be members of unions or active in forming unions; (2) refusal by employers to recognize and deal with unions organized by employees to act as their agents; and (3) undermining the unions of employees by organizing so-called company unions which the employer could control.

After decades of costly controversies in which these tactics were combated by unions through the use of their economic weapons of strikes, picketing, and boycotts, Congress adopted legislation to curb those employer practices which undercut the right of employees to organize. The six principal steps in this legislation are as follows:

In 1926, the Railway Labor act asserted the duty of railroads to deal with freely chosen representatives of their employees for the establishment of wages, hours, and other conditions of employment. In 1929, the United States supreme court held that railroad employers violate this law by forming company unions and dealing with them as if they were the freely chosen representatives of employees (*Railway Clerks v. Texas & New Orleans Ry.*). The Railway Labor act was amended in 1934 to provide for the designation, following a vote, of employees' bargaining agents by a government agency, the National Mediation Board. In 1936, this act was extended to cover airlines and their employees.

In 1932, the Norris-LaGuardia act, already referred to, forbade "yellow-dog contracts." It thereby put an end to the practice of requiring employees to consent in advance to their discharge if they joined a union.

In 1933, the National Industrial Recovery act authorized industry codes in which it was obligatory to incorporate terms which (1) prohibited employers from discriminating against employees for union activity and (2) required employers to recognize as bargaining agent of employees any union selected by the majority of the employees. The act was declared unconstitutional in 1935.
